CHEMIST for RESEARCH and development, Bachelor or Master's degree, several years' general practical experience required. Applicants should give personal record, draft rating, and salary expected. Only men with outstanding records need apply. Location middle west. Our employees notified of this ad.
Box 17-N-3, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTS immediately and in September, at Middlebury College, Middlebury, Vermont. Remuneration, $600 plus tuition and fees for half time assisting and half-time work towards advanced degree in Chemistry. Include transcript, photograph and references in application.
Box 18-N-3, Ind. & Eng. Chem., Easton, Pa.

ASST. to CHIEF of Laboratories. Technical graduate, married. Laboratories perform metal and inorganic analyses, metallurgical problems, physical testing, spectrographic analyses, water treatment, fuels, etc. State qualifications and experience from graduation, salary expected, etc. Location Philadelphia.
Box 20-N-3, Ind. & Eng. Chem., Easton, Pa.

WE have POSITIONS for all types of Chemical Engineers and Chemists and would be glad to receive applications from those who are being displaced because they are in non-essential industries, or for any other reason wish to make a change.
Box 26-NP-3, Ind. & Eng. Chem , Easton, Pa.

WE have POSITIONS for women who have majored in Chemistry and would be interested in receiving applications from those who are now graduating or who have received their degrees within the last five years.
Box 27-NP-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. With broad experience in industrial analysis for development of analytical apparatus. In reply give complete details of education, personal history, experience, salary desired, references, and send recent photograph. Location—Western Pennsylvania.
Box 34-NP-3, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS, Chemistry, University of Florida. Stipend $50.00 per month. 14 hours assisting per week. No tuition for Graduate Assistants but a fee of $21.25 per semester. For Application blank address, Dr. C. B. Pollard, Department of Chemistry, Gainesville, Florida

CHEMICAL ENGINEER, assistant to plant superintendent in organic chemical manufacturing, principally pharmaceuticals. Location—New Jersey. Age preferred—30 to 35 yrs., with 10 years' experience in production work. Furnish photograph, complete personal data including draft status, nationality, experience, education, and several references.
Box 42-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer wanted by research laboratories of large eastern manufacturer. Fairly recent graduate with one or two years of paint and varnish experience preferred. In reply include information on education, experience and salary desired.
Box 43-N-3, Ind. & Eng. Chem., Easton, Pa.

DYE CHEMIST with several years' experience in the synthesis of dyestuffs in production to supervise technical phases of such operations. Excellent position. Give complete information on self and experience, including photograph and references.
Box 45-NP-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer—mechanically inclined with one or two years' industrial experience plant & laboratory control. Metallurgical background desirable. Philadelphia area.
Box 48-NP-3, Ind. & Eng. Chem., Easton, Pa.

LIBRARY ASSISTANT who has a Ph.D. or its equivalent in chemistry and can handle languages other than French and German. Income will depend on language qualifications and ability to work with chemical literature. Hooker Scientific Library, Central College, Fayette, Missouri.

TEACHING POSITION for Ph.D. organic chemist (man or woman). Position may include summer session beginning June 1, 1942. Give detailed information on education (including language fluency), experience, and personal (including photo). Reply to Neil E. Gordon, Central College, Fayette, Missouri.

SEVERAL ENGINEERS with chemical, mechanical, or electrical training, and a physicist required at once for expanded development program by well-known group of associated companies manufacturing lumber, plywood, fibrous products and defense materials. Location Middle West or West Coast. Recent graduates, several years' experience, preferred. Submit details, education, experience, references, salary requirement, photograph, draft classification.
Box 57-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER to direct pilot plant and full scale development. Permanent position, large company, southern Louisiana. Require graduate training and several years' experience, preferably in oil refining or heavy chemicals. Replies treated confidentially. Give personal data, education, experience, salary expected, references, draft status, recent informal photograph.
Box 58-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST for CONTROL and analytical work in the laboratory of a plant manufacturing fatty acids and allied products. Location, near Newark, New Jersey. State training, experience, personal data, and salary expected.
Box 62-N-3, Ind. & Eng. Chem., Easton, Pa.

MIDWEST DISTILLERY desires to employ Ph.D. chemical engineer or equivalent by experience for research position in unit processes. Plant manufactures whiskey also alcohol for government.
Box 67-NP-3, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 358)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised—or in regard to those seeking employment.

(Situations Open Continued)

TECHNICAL ORGANIZATION located in southwest wishes to employ a chief draftsman and a number of senior draftsmen familiar with general petroleum and chemical plant design. Give complete details of personal qualifications, technical training, experience, references, and salary desired. Include a recent photograph.
Box 73-NP-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL or INDUSTRIAL Engineer, Insecticide Industry near Buffalo. Recent graduate not subject to draft in near future. Will be given training in laboratory, engineering production and time study work. Later to be assigned to special production problems. Include photograph with application. Give nationality and state salary expected.
Box 78-NP-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST-TECHNICIAN

for

Head of Sample and Development Laboratory

of

Prominent Paint Manufacturer

Under 45 years
Salary—$4000-$6000
Must be thoroughly experienced and have outstanding record.
State age, education, and draft status.
Submit a detailed record of experience.
An unusual opportunity for the man qualified.

PERSONNEL ADVANCEMENT BUREAU
Grant Building **Pittsburgh, Pa.**

PLANT CHEMIST wanted: Graduate chemist with plant experience in the manufacture of organic dyestuffs or dyestuff intermediates. Location, northern New Jersey. In first letter of application, state experience, education, marital and draft status, age, and give references.
Box 81-N-3, Ind. & Eng. Chem., Easton, Pa.

OPENING for CHEMIST, M.S. or Ph.D. Degree desired. Agricultural Research, Minor Element Investigations in Soils, Plants and Animals. Salary commensurate with training and experience.
Box 83-N-3, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMISTS, Ph.D's., with thorough training in laboratory research methods as well as in the fundamentals of organic or physical chemistry for positions as project leaders in research laboratory of major petroleum company of southwest. Recent graduates preferred. Give personal data and details as to scholastic training, salary expected, and references. Enclose recent photo. Advise if plan to attend Memphis meeting of A. C. S.
Box 86-NP 3, Ind. & Eng. Chem , Easton, Pa.

TEACHING FELLOWSHIP or full time assistantship in chemistry at Smith College. Teaching fellowship for graduate student, $600 for half-time; or full time assistantship $1200. Send complete personal data, including photograph and letters of recommendation to Chairman, Department of Chemistry, Smith College, Northampton, Mass.

INORGANIC CHEMIST, for research and development of inorganic heavy chemicals with well-known progressive up state New York concern. Submit full details of education, experience and complete personal data. Recent photograph desirable.
Box 89-NP-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, wanted by progressive upstate New York manufacturer. Recent or June graduate with advanced degree in Analytical Chemistry preferred. Submit full details of education, experience and complete personal data. Recent photograph desirable.
Box 90-NP-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, for research work by progressive upstate New York manufacturer. Recent or June Ph.D. preferred. Submit full details of education, experience and complete personal data. Recent photograph desirable.
Box 91-NP 3, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

CHEMICAL ENGINEER, D. Eng., 13 years' experience in plant research, development and control including construction, installation, maintenance, operation in the oil refining industry, age 38, married. Desires new connection where his abilities can be utilized fully.
Box 49-N-2, Ind & Eng. Chem., Easton, Pa.

PRODUCTION CHEMIST. Graduate chemical engineer with twenty years' experience in heavy chemicals, acids, purified cellulose fibre, nitrocellulose, viscose-cellulose film, paper coatings, lacquer formulation. Positions held: chief chemist, development engineer, production department head, plant superintendent. Primary interest: production supervision.
Box 74-N-2, Ind & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., with Ph.D. in agricultural biochemistry. Graduate training includes work in chemical engineering, organic chemistry, biochemistry, and bacteriology. Five years' experience in food industry. Sigma Xi, Phi Lambda Upsilon. Desires position in the Middle or Far West.
Box 43-T-2, Ind. & Eng. Chem., Easton, Pa.

COLLEGE or UNIVERSITY Professorship. Ph.D. from leading university, experienced teacher general and organic chemistry. Research, publications, administrative and industrial experience. Interested also in high-type course for non-chemistry majors. Married.
Box 49-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: will complete work for Ph.D. 1942. Major inorganic and analytical. Good training in organic. Desire position doing research. Preferably New York City or vicinity. 18 years' practical experience. Publications. Available immediately.
Box 61-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1928, minor physics, 13 years' experience synthesis, aliphatic, aromatic, heterocyclic compounds, also enzymes, vitamins, coal tar products and plasticisers; familiar with physico-chemical methods. Want responsible position in organic research, preferably with biochemical applications. North or South America.
Box 65-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Organic Ph.D. Teaching or research. Twenty years' College Professor. Agricultural Experiment Station Research Experience. Protestant. Married. Location immaterial. Now employed, but desires change. July 1, 1942.
Box 90-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.A., sixteen years' experience in research, production, and control especially in foods, bacteriology, and biochemistry. A good plant manager and superintendent; successful research and sales experience. Can get things done and usually make money for employers. Age 39, married, Protestant.
Box 92-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.Ch.E., 1940, Tau Beta Pi. Single, 23, 3A draft. Two years' experience development synthetic resins and plastics, mainly laminated phenolics. Desire any position in plastics industry. Metropolitan area preferred, but will consider anywhere. Available immediately.
Box 100-T-2, Ind. & Eng. Chem., Easton, Pa.

EXPLOSIVES CHEMIST. 1½ years' dynamite plant; analysis, testing of powder, mixed acid and nitroglycerin Explosives laboratory; some plant operation. Graduate ESMDT course powder and explosives. Desire explosives development or inspection. Cal. Tech. Publication. Inorganic analysis. 2-B deferred. 23, single. Anywhere.
Box 101-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942. Available immediately. Research experience in organic syntheses and enzyme chemistry. Interested in organic, biochemical or drug research. Age 24, single, draft deferred. East preferred. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi.
Box 102-T-2, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research. Ph.D. this June. Organic major. Protestant, male, age 27, Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi. Graduate assistant and Fellow in organic chemistry for three years. Desire instructorship in organic chemistry. Location immaterial. Available in June.
Box 10-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and CHEMICAL Engineer with exceptional background of industrial and teaching experience. Successful record of process development, production supervision, research in cosmetic preparations, water treatment, metallurgy, fertilizers. Publications. Interested in management, development, research, teaching. Location immaterial. Married, children, 34.
Box 12-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. June 1942, desires position in research, development or production. Broad experience in organic synthesis. Minor in physical chemistry. Sigma Xi, fellowship. Single, draft 2A, Jewish. Available June. Eastern location preferred but not essential.
Box 13-N-3, Ind. & Eng. Chem., Easton, Pa.

WOMAN Ph.D. (Physical) with eight years' successful teaching experience in General, Analytical, Organic, and Biochemistry. Desires responsible teaching or industrial position. Now teaching. Excellent references. Interviews at Memphis meeting.
Box 15-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Two years' toward Ph.D. Industrial experience. Excellent academic record. Sigma Xi, Tau Beta Pi. Has surpassed requirements of present position. Desire research position in midwest or east.
Box 16-N-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST. Chemical Engineer. Eight years' teaching chemistry and chemical engineering. Six years' varied industrial experience in responsible positions. A.I.Ch.E. Desire teaching position — chemistry.
Box 19-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B Sc. 1940 from Philadelphia College of Pharmacy and Science, desires research position in plant, manufacturing phthalic anhydride by the catalytic oxidation of naphthalene. Age 26.
Box 21-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER — Chemist, M.S., broad experience in sales, manufacturing and research and development; excellent record; sound knowledge of and experienced in patent law; law graduate; desire supervisory or management work in petroleum or chemical industry.
Box 22-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST Ph.D. 1933. Eight years' experience in physical, biological and rubber chemistry. Position desired which offers greater opportunities. Rocky Mountain or Pacific area preferred but not essential.
Box 23-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC Ph.D. '40. Physics minor. Two years' research experience. Three publications. Sigma Xi, Phi Lambda Upsilon. Desires research position in Niagara Frontier area. Protestant. Class 3 draft. Employed. Available on reasonable notice.
Box 24-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 16 years' experience in plant research, development and control including construction, installation maintenance especially in the pharmaceutical and synthetic organic chemistry. Desires connection where his abilities can be utilized fully.
Box 25-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S. 1939. Additional graduate training. Two years' experience in organic research and development. Young, responsible, good personality, single, draft deferred. Desires organic research position in metropolitan area. Presently employed.
Box 30-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., with some engineering training, age 35, married, Protestant, Anglo Saxon, 10 years' research experience, naval stores, terpenes, resin acids, olefin polymerisation and hydration, catalytic vapor phase oxidation. Wishes position teaching, research, development, plant operation.
Box 33-N-3, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION, College or University. Ph.D. Johns Hopkins, 1931. Nine years' teaching experience, broad background, genuine interest in teaching. Married, Methodist, age 39. Available July 1. Have permanent, responsible position with a scientific agency of the Government but wish to return to teaching.
Box 37-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 27, married, now teaching in a large N. Y. college. Desires part-time work in synthetic organic research and for full-time summer employment in N. Y. C. area. Excellent training and experience. Particular desire to assist in war effort.
Box 38-N-3, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, B.A. 1932 Production and research experience in diversified fields. Employed. Desires responsible position with manufacturing company. Details forwarded by air-mail, on request.
Box 39-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S. 1941, M.I.T., over 100 semester hours chemistry. 6 months' experience plastics research. Now employed. Desire position with greater opportunity. Research, development, or production. Available on short notice. Prefer Middle Atlantic or Middle West. Age 22, single, Class 1B. Excellent references.
Box 40-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., M.I.T., 1938. Research experience in synthetic organic, electroorganic, sterols, vitamin D. Industrial research or development desired; also teaching. Employed, but available immediately. Deferred 2A.
Box 41-N-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D. specialising in surface chemistry, emulsions, catalysis, corrosion, powder-metallurgy. Desires research or teaching position.
Box 44-N-3, Ind. & Eng. Chem., Easton, Pa.

INORGANIC and PHYSICAL Ph.D. desires position with more promising future. 3 years' xperience at A.C.S. accredited colleges teaching qualitative, quantitative and general chemistry. Research publications. Age 27, Protestant, married. Available in late May for academic or industrial position.
Box 51-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST — PLANT Executive. 25 years' experience. Full responsibility for plant operation, maintenance, chemical control and pilot plant development. Experience covers wide variety of chemical processes and equipment. Developed two new products now being marketed. Expert analytical chemist. Interested in supervision of manufacture or laboratory.
Box 52-N-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A. 1941 from leading A.C.S. approved university. Age 24, single, good health. Thorough training in all branches of chemistry. Prefer far West, but available anywhere immediately. Mechanically inclined. Desire research or development position. Hope to attend Memphis meeting.
Box 53-N-3, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 359)

(Situations Wanted Continued)

PRIVATE RESEARCH assistant in large Eastern university. Organic chemist, Ph.D. 1941. Undergraduate major — Bio-chemistry. Research on amines, amino acids, unsaturation, organic synthesis. Publications. Graduate assistant in organic 4 yrs. Desire research or teaching position. Draft deferred, 27, single, available immediately.
Box 54–N–3, Ind. & Eng. Chem., Easton, Pa.

GRADUATE STUDENT M.A. With one year of course work on Ph.D., desires instructorship, whole or part time, with opportunity to do research for doctorate. Would also consider college teaching position. Thorough training and good record in Physical and Organic Chemistry, Physics and Mathematics.
Box 59–N–3, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED REFINER of corn starch, corn syrup and by-products, seeks position as director of research, chief chemist, assistant shift superintendent or general superintendent.
Box 60–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. candidate (June) from large eastern university desires industrial research position after June 1. Thesis in synthetic organic chemistry. Well grounded in physical, analytical, and biochemistry. Four years' teaching experience. Age 25, single, American. Phi Lambda Upsilon, Sigma Xi.
Box 61–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Austrian Ph.D. 1933, post graduate work, 8 years' industrial experience, 2½ years in synthetic resins and waxes, emulsions, surface active agents, oils and fats, Literature research in French, Italian, German, 3 years' in U. S. A. and here employed. First citizenship papers, age 33, married, references.
Box 63–N–3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A., 1942, desires position research or development. Preferably in New York City or vicinity. Age 31, draft deferred, single, Phi Beta Kappa.
Box 64–N–3, Ind. & Eng. Chem., Easton, Pa.

PLANT MANAGER or Superintendent. Accustomed full responsibility. Chemist and chemical engineer. Plant design, pilot, layout, development; operation, maintenance, production planning, costs, chemical economics, personnel and sales relations. Synthetics, solvents, plastics, extracts, oils, alkaloids. Distillation (including vacuum), alcohol recovery. Age forty, married, American ancestry, Protestant, consulting experience, patents, publications, references. Available short notice. Reasonable salary.
Box 65–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC and PHYSICAL Chemist, M.S. Chem., two years' research experience, two years' college teaching, thoroughly experienced various aspects of organic chemical techniques and physico-organic methods. Research and development preferred. Eastern location.
Box 66–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1939. Desires research position in the middle-west, in the field of synthetic organic chemistry. Resin experience. Presently employed, available within reasonable time. Draft deferred. Single.
Box 68–N–3, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1928, with ten years' experience in teaching general, inorganic, analytical chemistry. Publications. Abstractor for the encyclopedia of chemical reactions. First rate references. Age 37, single. Ex-Austrian. Employed. Available within reasonable notice. Location immaterial.
Box 69–N–3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., A. C. S. approved college. Two years' industrial experience special methods of analysis. Desires research and development or production position contributing to "all out" emergency effort. Prefers East, Middle East. Married, 26. Draft 3A.
Box 70–N–3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, M.Sc. 1940 with 1 year of industrial experience desires employment in any of the Defense Industries, in control or in production. Also desires position as an Assistant Spectrographer. Eastern location preferable but not essential.
Box 71–N–3, Ind. & Eng. Chem., Easton, Pa

ORGANIC CHEMIST, Ph.D. 1929. Now employed. Sigma Xi, Alpha Chi Sigma. Publications. Age 45, Protestant, married. South preferred but not essential.
Box 72–N–3, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., 9 years' research in proteins and pharmaceuticals. Development of processes for biologicals, vitamins. Broad biochemical training. 3A deferred.
Box 74–N–3, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST & Chemical Engineer: Extensive experience production, research, development, control work, specification writing. Employed by Government and industrial companies. Experience in food, fuel and building materials industries. Good references. Employed, available on short notice.
Box 75–N–3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL and INORGANIC Chemist, Ph.D. Cornell, with five years' of teaching experience in general chemistry, and about ten years of research in insecticides and fertilizers, with publications and patents and experience translating and abstracting, desires teaching or research position.
Box 76–N–3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST DRUGS, B.S., M.S. with fifteen years' of wide and varied experience in research, control, and manufacturing. Author of numerous publications and also books. Seeks responsible position in research, control, and manufacturing. Age 40, married, employed.
Box 77–N–3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1939, excellent educational background in organic, physical chemistry; two years' experience responsible development work on synthetic resin and water soluble coatings; presently employed; desires research or development position in expanding industry.
Box 80–N–3, Ind. & Eng. Chem., Easton, Pa.

ATTENTION MANUFACTURERS contemplating production of Synthetic Phenol by the sulfonation process. An Industrial research chemist with twelve years' successful organic research experience including extraordinary achievement in research, development and operation of synthetic phenol plant is available for responsible position supervising development and operation of this process. A. C. S. Member. Married. Advanced degree. Excellent recommendations. For complete details write R. W. Bixby, Inc., 443 Delaware Ave., Buffalo, N. Y. Reference 8106.

CHEMICAL ENGINEER B.S. in Ch.E. 1939. Experienced in research and development work. Desire development work or position giving technical service or assistance to production department. Will work anywhere under any conditions provided pay is commensurate. Company must be eligible to request continuance of 2-B draft classification.
Box 88–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1938 from large mid-western university; wide synthetic experience. Employed directing own research program. Desires position with opportunity for advancement. Resourceful, responsible. Age 29, draft 3A. Middle-west, East preferred. Available reasonable notice.
Box 93–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Research and Development. Ph.D. chemistry. Thoroughly trained and capable of organizing and directing research. Wide experience in synthetics over a period of nine years. Special experience in the development of chemical products from hydrocarbons. Employed.
Box 96–N–3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., professor, desires change Six years' industrial and thirteen years' teaching experience. Specialties: unit operations, heat transfer, pilot plant equipment, engineering chemistry. Both lecture and laboratory work. Successful industrial research and teaching record. Age 39, Protestant, married. Prefer teaching position in the fields stated. Available June.
Box 98–N–3, Ind. & Eng. Chem., Easton, Pa.

WOMEN CHEMIST, Ph.D. 7 years' experience in organic, physiological, analytical chemistry and bacteriology. Fluently German, French, Italian, reads Spanish. Desires research, analytical or literature position. Preferably in East.
Box 100–N–3, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

RESIN and VARNISH Chemist with experience in research and production of Phenolic, Alkyd and Maleic Resins and substitutes from available materials, and use of resins in all types of varnishes. Familiar with Government specifications, Technical Sales, Publications. Location immaterial. Draft class 3A. Available immediately.
Box 28–N–3, Ind. & Eng. Chem., Easton, Pa.

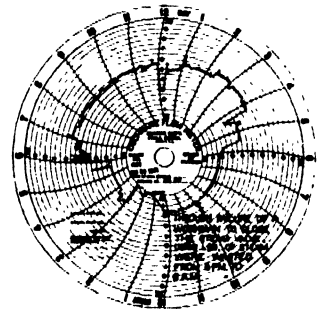
RESEARCH CHEMIST. Ph.D. several years' experience in industrial research desires comparable position in south or southeast. Varied experience. Excellent training. Publications. Phi Beta Kappa, Sigma Xi.
Box 47–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D Age 27, single, 4C draft. Good basic background; experienced in synthesis and research work. Desires position in or near New York City.
Box 84–N–3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, eight years' experience in research, development, specification, applications of vinyl type resins and coatings. Interested in plastics or synthetic rubber. B.Ch.E., M.Sc., age 31, married, Protestant, class 3-A, employed non-defense.
Box 85–N–3, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST, 25, seeks position with manufacturer of extracts, preserves, baker's supplies or similar products. Two years' experience with development and control. Has good knowledge of food materials and processing equipment. Three years' college chemistry. Military service deferred.
Box 92–N–3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D., wide experience chemical patents. Desires position with patent department or patent law firm.
Box 94–N–3, Ind. & Eng. Chem., Easton, Pa.



CHEMICAL ENGINEER, B.S., M.S. Eleven years' design, installation, operation plants manufacturing synthetic organic chemicals. All types distillation, catalytic hydrogenation, dehydrogenation, development, process design, project engineering. Desire permanent position in supervisory capacity—production, plant engineering or design. Employed. Married.
Box 95–N–3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Research experience; phenols, sterils, vitamins. Organic micro-analysis. Publications. Draft deferred. Desires position in organic research.
Box 97–N–3, Ind. & Eng. Chem., Easton, Pa.

Industrial News

Flowmeter Record Discloses Waste of Steam

THIS chart, a 24-hour record of steam consumption in the hog-killing department of a Chicago plant, shows a consumption of steam from 6 P. M. to 6 A. M., when the department should not have used steam. Investigation disclosed that steam had been permitted to leak into the hot water heater all night. The loss was 111,600 pounds of steam, costing $33. This is one illustration of the value of departmental steam flowmeters, made by Cochrane Corp., Philadelphia.

Subzero Refrigerator

NEW industrial type subzero Cold Treater refrigerators maintaining temperatures down to −35° F. for laboratory research and testing, and production processing, aging, manufacturing, and assembly are announced by The Jewett Refrigerator Co., Inc., Buffalo, N. Y. These refrigerators are built in 3- and 6-cubic foot capacities, equipped with self-contained, trouble-free sealed condensing unit ready to plug in and use.

Standard control maintains temperatures from +5° F. down to −10° F. Special control gives temperatures from +20° to −35° F.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

LONG ESTABLISHED reliable concern with finances and manufacturing equipment wishes to produce chemicals of unusual nature for defense. Willing to develop promising process.
Box 49-N-3, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: manufacturing process for Diphenylamine. Offers
Box 70-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: Quotations on Bilstein "Handbuch der Organischen Chemie," 4th edition and 4th supplementary complete or in parts; Gmelin 8th edition; Berichte 49, Nos. 8-12; 61, No. 8; 64, No. 1.
Box 67-T-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: Subcontractor with equipment to carry out Hydrogenations on several products on a profitable custom basis. If you have surplus capacity for this type of operation write at once to Box 36-N-3, Ind. & Eng. Chem., Easton, Pa.

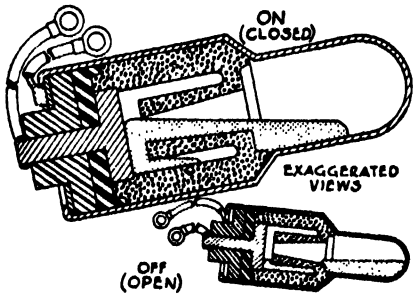
WANTED: "Journal of Physical Chemistry"; Vol. 23 (1919) nos. 1, 2, paying $3. each; Vol. 25 (1921) complete, paying $12. "Rubber Chemistry and Technology"; Vols. 2, 3, 4 (1928-1930), paying $5. each. Foreign chemical journals wanted for private library. Dr. G. H. Franzius, 201 East 82nd Street, New York, N. Y.

FOR SALE: Ullmann, 1st edition; Journal of the American Chemical Society 1901-1940, also 1908 to 1933, 1922 to 1933, and Collective Index to volumes 1-20; Industrial and Engineering Chemistry complete.
Box 11-N-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Abbe refractometer, Model I, Zeiss Jena, with thermometer and other accessories, description and dispersion tables, in wooden case, scarcely used, perfect condition.
Box 29-N-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journals. Society Chemical Industry 1907-1923. Industrial & Engineering Chemistry 1924-1935. American Phar. Assoc. YearBooks 1912-1933. Proceedings 1899-1911. Collective Index 1903-1925. Chemical Engineer 1905-1915.
Box 31-N-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: J. Chem. Education, Volumes 1-17, excellent condition, unbound, $75.00 f.o.b. Wilmington. M. W. Grafflin, Hercules Powder Co., Wilmington, Delaware.



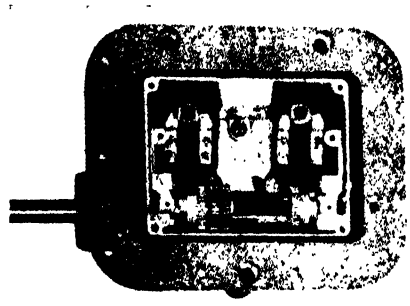
FOR SALE — 2000 lbs Cerium Chloride Tech — 1000 lbs Maleic Anhydride — 1000 lbs iron Carbonyl — 1000 lbs Zirconium metal powder — 1000 lbs Titanium Carbide — 1000 lbs Tungsten Trioxide — 5 lbs Yttrium Oxide CP — 1000 lbs Marcasite crystals — ton yellow arsenic.
Box 46-N-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Bausch & Lomb photomicrographic equipment includes GBVPAA camera with supporting stand, microscope, lenses and accessories. Further information given upon request. Bona Allen, Inc., Buford, Georgia.

FOR SALE: 100 Grams Calciferel, 100 kilos Podophylin, 3 kilos Cysteine Hydrochloride, 5 lbs. Quinine Bismuth Iodide, 100 lbs. Calcium Glucoheptonate, 2 kilos Histidine Monohydrochloride, 10 grams Glutathione.

Box 99-N-3, Ind. & Eng. Chem., Easton, Pa.

Double Flow Mercury Switching



IN THE apparatus developed by Durakool, Inc., 1029 North Main St., Elkhart, Ind., two tails of mercury pulling in opposite directions over a ceramic barrier until severed prevent double contacting where vibrations exist. When closing, the two approaching bodies of mercury pile up a double-thick electrical conductor. Double flow operates either as a slow rolling motion or on a very high speed mechanical snap action.

Feeders with Fluid Sealed Yoke

A NEW series of Adjust-o-feeders has been developed by %Proportioneers, Inc.%, Providence, R. I., equipped with cylinder support frames carrying the new fluid sealed yoke and incorporating other improvements. The yoke permits the use of an enclosing fluid around the plunger and stuffing gland, sealing these parts from contact with the air and preventing damage from corrosive liquids or build-up on the plunger from liquids carrying suspended solids.

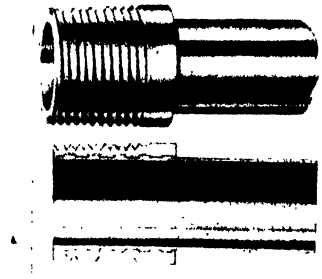
SALES and production problems brought about by the tremendous war requirements for transmission products came in for careful study at a two-day conference of the W. A. Jones Foundry & Machine Co. national sales force and factory executives, held in Chicago on January 15 and 16.

Rotating-Type Limit Switches

G. E. watertight limit switch

THE General Electric Co., Schenectady, N. Y., has announced the addition of two new forms to its line of CR9441-C2 rotating-type limit switches. One form is for Class I, Group D, hazardous gas locations and the other is for applications requiring a water-tight switch. The new switches both are housed in heavy, flanged, cast-iron enclosures.

Cement for Laying Insulating Firebrick



A CEMENT for use in laying insulating firebrick has been introduced after an extensive development program by the Building Materials Division of the Armstrong Cork Co., Lancaster, Penna. Known as Armstrong's No. 2500 cement, the new product is designed especially for use in laying the company's A-16, A-20, and A-25 insulating firebrick.

Because the cement is made of high-grade refractory clays and grog, it is said to provide a coefficient of expansion of the dried cement virtually the same as the brick with which it is used, eliminating cracking and peeling caused by differential expansion. No. 2500 cement is particularly suitable for use directly exposed to furnace temperatures over 1800° F.

Current Saving with Fluorescent Lights

POINTING out fluorescent as "victory light", the Lighting Engineering Division of W. H. Long Co., 425 North Clark St., Chicago, urges plant operators, store proprietors, etc., to cut their light load now. According to the company, fluorescent lighting can duplicate incandescent light and save about half the current, or it can cut the load about 40 per cent while increasing light about 25 per cent. The company offers its services without charge in estimating improved lighting efficiency and current saving to any concern applying for this help on business stationery.

Wallace Joint to Save Metals Needed for Defense

THE Tri-Clover Machine Co., Kenosha, Wis., is offering a new type joint that saves stainless steel. The Wallace joint permits the use of thin-wall tubing in connection with standard threaded iron pipe size fittings of all kinds. This joint consists of special threaded and enlarging ferrule inseparably joined to a length of stainless tubing through the medium of expansion. The company claims that, by use of the Wallace method, dead weight can be eliminated, with a resultant saving of approximately 65 per cent in material and without loss of effectiveness.

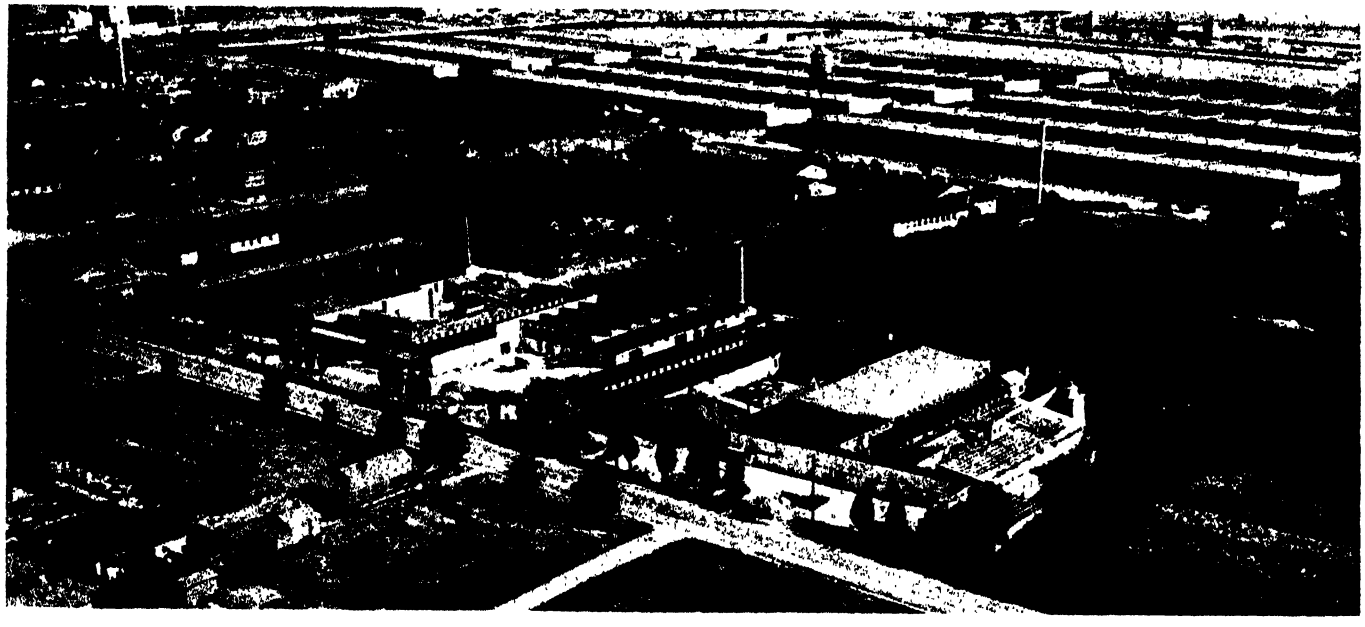
Industrial Memphis

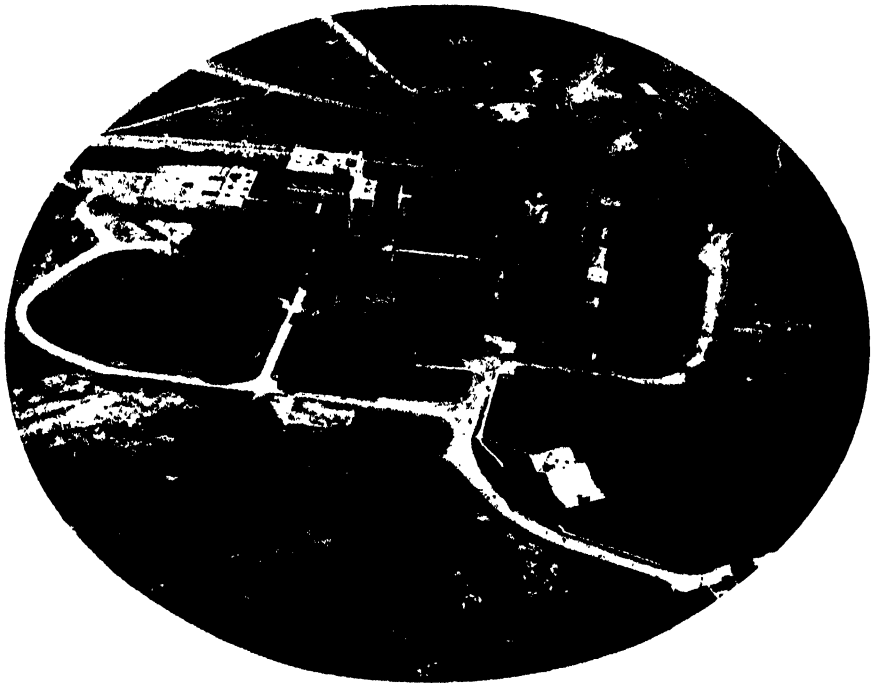
MEMPHIS industry reflects her agricultural environment. Situated in the heart of the cotton country with the rich alluvial delta lands of Mississippi and Arkansas just down the river, Memphis is the world's largest cotton market and manufacturer of cottonseed products. As a result, the many cottonseed mills whose by-product meal and cake are valuable as animal foods, together with the several manufacturers of mixed feeds, make the city the South's largest producer of livestock feeds, an important livestock market, and, despite the claims of Missouri, the largest mule market in the world. It is the world's largest hardwood lumber market and the South's largest producer and distributer of chemicals and drugs.

Located on the Mississippi River half way between Chicago and New Orleans, Memphis enjoys unique distribution advantages as a chief port on the Nation's inland water routes and the focal point of 10 major railroad systems. Many large industrial companies have recognized these advantages and in the recent trends toward decentralization have established branch plants or distribution headquarters in Memphis. This trend has made Memphis the largest nonproducing steel distributer in the Nation.



Many of the largest steel companies of the North and East have private barge shipping operations to warehouses here. Among these are Jones-Laughlin Steel Corp., Wheeling Steel Corp., Youngstown Steel Corp., and Carnegie-Illinois Steel Corp. Bethlehem Steel Corp. and several others maintain district sales offices in Memphis, ranking it among the first 20 cities of the Nation as a wholesale center. The oldest steel fabricating plant in the city, the Virginia Bridge Co., subsidiary of the United States Steel Corp., distributes its products from Memphis to 20 states including California and the Pacific Northwest.

In the past year, many industrial concerns in Memphis have seen increasing amounts of their output directed to national defense. Some plants have entirely changed their schedule of production, and a number of new industries have been located in Memphis as a direct result of the defense program.



Cottonseed products comprise the largest group of manufacturers in Memphis, with eight oil mills crushing cottonseed, four refineries, three hydrogenation plants, and one pulp plant purifying cotton linters.

The Southern Cotton Oil Co., first large cotton oil plant to be established here, is a subsidiary of Wesson Oil and Snowdrift Co. Three main divisions of the plant consist of a crude oil mill, a refinery, and a shortening plant. In refining crude cottonseed oil, it is first treated with dilute caustic to remove free fatty acids, bleached with an absorbent earth, and sent to the shortening plant to be finished in any of several ways.

By mere chilling and filtering off the saturated glycerides that are thereby solidified, a pure salad oil is obtained. Or the bleached oil may be mixed with either hardened vegetable oil or animal fats to make compound shortening, sometimes called compound lard. Hardened vegetable oil is a completely hydrogenated cottonseed oil. In this form the product is fully saturated and approaches the hardness of stone. Partial hydrogenation of cottonseed oil, however, gives the most desirable type of vegetable shortening.

Aerial view of McCallum Robinson and the Federal Compress and Storage Co.

Southern Cotton Oil Co.

Many brands of this product are on the market and they are customarily packed in sealed cans, while the more perishable compound shortening is usually put up in waxed paper boxes.

As the final treatment, all forms of vegetable shortening and salad oil are deodorized by blowing through with steam.

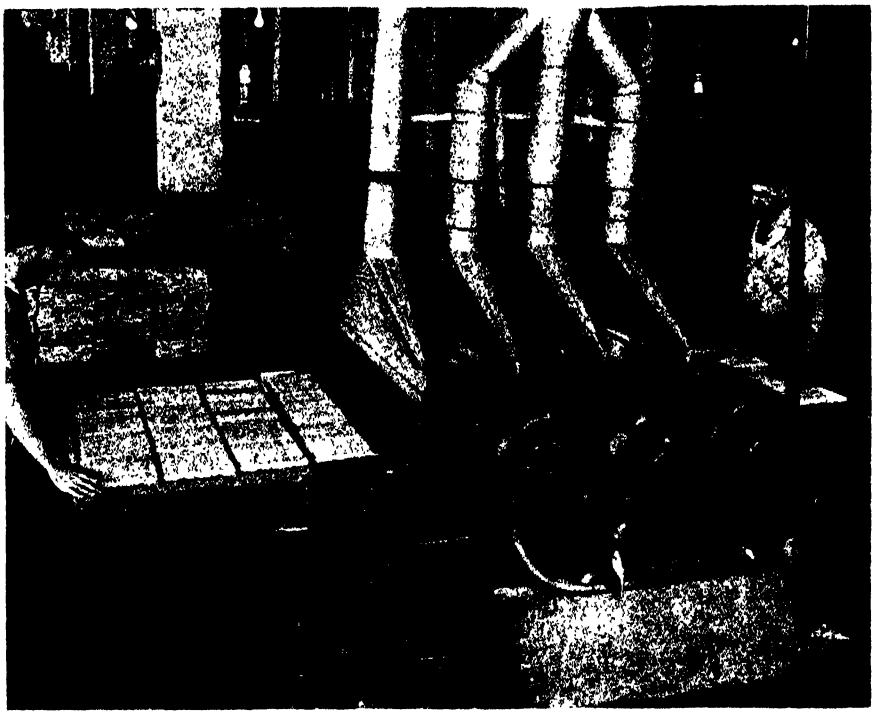
There are two other hydrogenation plants in Memphis. Cudahy's Leewood Refinery is the largest of the several refineries operated by this company in the country. Humko is a Memphis-owned plant of about the same size. These latter plants manufacture their hydrogen by the well-known iron-steam process, whereas Southern Cotton Oil Co. uses electrolysis. All three plants make all of the above-mentioned types of shortening.

Swift & Co. has a cottonseed oil mill and a refinery in Memphis, but does not hydrogenate there. Its hardened oil is brought in to make compound shortening Armour operates the Memphis Cotton Oil Mill. The Perkins Oil Co. has two seed-crushing mills, one in Memphis and the other across the river in West Memphis, Ark. Aside from the cotton oil mill and the pulp plant, the Buckeye Cotton Oil Co. also operates a mill crushing soybeans.

Necessary adjuncts to cottonseed processing are the laboratories for grading seed, oil, and lint purchases and the control of the manufactured products. Many plants maintain their own facilities, but besides these are the vitally important commercial laboratories which do official cottonseed grading under government license. There are two such laboratories in Memphis, both in the heart of the business district on "Cotton Row", as that section of Front Street is sometimes called.

Woodson-Tenant Laboratories, Inc., is devoted exclusively to cottonseed, soybeans, and their products. This includes the analysis and grading of cottonseed, analysis of cake and meal for protein, of vegetable oils for fatty acids, and refining yield and cotton linters for alpha cellulose.

Founded in 1917, Barrow-Agee Laboratories, Inc., is the largest commercial laboratory in the South. An interesting feature of the laboratory is the unique calculating table where space is provided for eight people to figure yields and analyses of cottonseed from the experimental data. During the rush season from September through December, several thousand individual analyses per day are cleared over this table.



In addition to cottonseed and soybean products, this laboratory maintains an engineering department for the testing of materials used in construction. Besides its main laboratory in Memphis, Barrow-Agee has branch laboratories in Shreveport, La., Jackson and Leland, Miss., and Cairo, Ill.

Rounding out the cotton picture are the Bemis Bag Co., makers of burlap, cotton, and paper bags, and the American Finishing Co., dyers and finishers of cotton cloth. Cotton damaged by fire and water is salvaged by McCallum & Robinson, Inc. The damaged materials are separated from the good which are cleaned, spun into yarn, and made into blankets, mops, and rugs.

A.

At E. L. Bruce Co., manufacturer of wood floor blocks

Agricultural insecticides are manufactured in Memphis by the Commercial Chemical Co. An entirely seasonal business with the demand dictated by the whims of the weather and insect cycles, this company operates during the growing season from March to November in a model plant where even the shipping drums are fabricated in its own shop. The world's largest producer exclusively of calcium arsenate, the company distributes its product wherever cotton is grown, including Peru, India, and Australia.

The Virginia-Carolina Chemical Corp., first to produce phosphate fertilizers, has 42 factories throughout the North, East, and South. Built before the turn of the century, the Memphis plant makes sulfuric acid by the lead chamber process for the production of superphosphates. Occupying a central position in regard to raw materials, this plant brings together Texas sulfur and phosphate rock from Middle Tennessee with smaller amounts of Chilean nitrate and potash from New Mexico.

Three of the four leading meat packers of the Nation have abattoirs at the Memphis stockyards. Swift and Cudahy operate plants under their own names, while Armour operates the Memphis Packing Co. as a subsidiary.

Closely allied to the meat packing industry is the Tennessee Soap Co., manufacturing yellow laundry soap from tallow, brown grease, and rosin, while cottonseed foots are utilized to make washing powder. By-product glycerol is sold to the plastics industry. Built eight years ago by the Humko Co. as an experimental plant handling only refinery foots, the plant is now independent and is the only soap factory in the State of Tennessee.

Practically all known wood products are manufactured in the State, upholding a tradition of wood utilization established since the War between the States. They include hardwood flooring, fine veneers and paneling, oak whisky casks, golf shafts and blocks, battery separators, caskets, furniture dimension stock, lawn furniture, handles for agricultural tools, and shuttles for cotton mills. Leaders in this industry in Memphis are Nickey Bros., established three generations ago as the first commercial user of gum timber in the Nation, Chickasaw Cooperage Co., makers of barrels with five branch plants and many lumber mills throughout the country, and E. L. Bruce Co. which recently dramatized the beauty and permanency of wooden floor blocks by selling 7,000,000 square feet of hardwood blocks used in the vast new construction of Parkchester residential group in New York City.

Representing the chemical industry in the hardwood development of Memphis is the Forest Products Chemical Co., wood distillers making acetic acid, methyl alcohol, and many by-products and derivatives. Using the Suida process of vapor-phase extraction, the company was a pioneer in the use of direct methods for the production of acetic acid. It has continued to keep pace with modern developments and now uses an azeotropic distillation with ethyl acetate to produce anhydrous acetic acid. In the utilization of by-products, Forest Products was the first to develop the commercial idea of

Giant recovery towers in arsenic acid plant of Commercial Chemical Co.

Bottling and finishing line at J. R. Watkins Co.

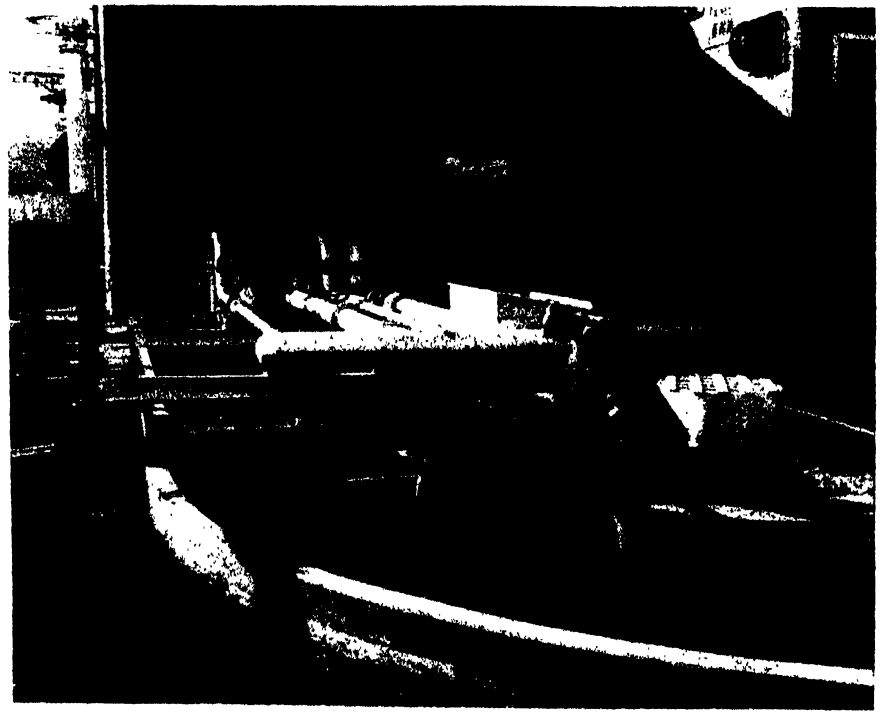
sacking and distributing charcoal for domestic use in the South.

Associated with Forest Products Chemical Co. is the Crossett Chemical Co. of Crossett, Ark., some 200 miles southwest of Memphis. This plant grew out of the experience gained at Forest Products and uses the same processes. Its capacity of 100 cords of wood per day is slightly higher than that of the Memphis plant, but it sends its crude alcohol there for refining.

Although not directly a defense industry, acetic acid, wood alcohol, and charcoal are under mandatory control, and the current ouput is not sufficient to supply the demand. As a result, a number of the smaller wood distillers that were forced out of business by competition from synthetic acetic acid and methanol during the depression years are reopening. Forest Products Chemical Co., however, as one of the larger wood distillers of this country, has been in continuous operation for over 30 years.

Among the large manufacturers of pharmaceuticals and proprietaries in Memphis is the Van Vleet-Ellis Division of McKesson-Robbins, largest wholesale drug concern in the Nation. This division puts on its own line of drugs in addition to those with the McKesson-Robbins label and is one of the five manufacturing plants in the company with a complete system of laboratory control. Plough, Inc., is one of the few manufacturers of proprietaries operating a pharmacological laboratory. The main plant is in Memphis with branches in South and Central America. J. R. Watkins is the largest producer in the world of vanilla and pepper, and its line of insecticides is growing rapidly. Its experimental farm just outside the city has recently been closed to visitors for the duration. The shortage of tin is being felt by the Wm. A. Webster Co. Its shaving and dental creams are now put up in collapsible tubes of substitute material. Compressed tablets and coated pills are also included in the products manufactured by this company.

The paint and varnish industry is represented in the Memphis district by three manufacturers, the DeSoto Paint & Varnish Co., True Tagg Paint Co., and Southern Shellac Manufacturing Co.



The DeSoto Paint & Varnish Co., manufacturing a complete line of paints for Sears, Roebuck & Co. in the South and Southwestern territories, operates one of the South's largest and most completely equipped paint and varnish manufacturing plants. It also manufactures a complete line of paints and varnishes for its own sales.

True Tagg Paint Co. also manufacturers a complete line of paint and varnish products, both for industry and consumers' use.

The Southern Shellac Manufacturing Co. is the only importer and bleacher of shellac in the South. It is also the only shellac manufacturer in the country able to produce bleached shellac in a continuous process, this position having been attained through the building and installation of a unique modification of the flash drying system for drying heat-sensitive products.

Recent development of the Yazoo oil fields in Mississippi has resulted in the establishment of the Delta Refining Co. in Memphis, the first complete oil refinery in the State of Tennessee. The plant was built in 1941 to produce asphalt, but since the demand has been greater for some of the lighter fractions, a cracking unit has been added.

Among decentralized industries established in Memphis, the foremost are the Firestone Tire & Rubber Co. which opened its plant there in 1937 and the duPont company which started the production of smokeless powder there late in 1940. Another is Globe-Union, branch of the Milwaukee firm manufacturing storage batteries. Savings of 50 per cent are made in transportation costs of the heavy materials to be made into batteries for distribution in the South.

Exterior view of the testing laboratory of Layne & Bowler, Inc., in Memphis, showing rectangular wier, wier pond, and play pipes with venturi throats. Both methods of measuring water are used simultaneously, and each serves as a check on the other.

Operations in the closing and packaging of collapsible tubes containing shaving cream at the Wm. A. Webster Co.

Foremost among machine products manufactured in Memphis are the vertical turbine pumps made by Layne & Bowler, Inc. These pumps are used in municipal, industrial, and agricultural well installations and as booster pumps for fire or other services requiring high pressures. The extremely limited space available for the operation of a turbine pump in well casings complicates the problem of design and manufacture. These are closely controlled by performing all operations at the Memphis shops, from the arrival of the raw metals to shipping the finished pumps. Starting with the engineering and design department, the plant comprises a pattern shop, complete foundry and core-making shop, machine shop, and hydraulic testing laboratory.

One of the oldest industries in Memphis is also one of its largest. Established in 1872, the American Snuff Co. is one of the world's largest producers of snuff. Using only domestic leaf, the Memphis plant employs modern equipment for its many operations including cutting and grinding the tobacco, making tin cans, and packaging the finished product.

Concluding the long list of products manufactured there that contribute to the important and stabilizing influence of a diversified industry in Memphis are railroad brake shoes and switches, automobile lifts, metal drums and cans, lamp chimneys and hand-blown glass bottles, waxed paper, shoe polish, and beer.

More information about the industries of Memphis will be published for CHEMICAL AND ENGINEERING NEWS readers in the April 10 issue.

Walte E. Chandler, Mayor of Memphis

TOOLEY-MYRON STUDIOS

MAYOR Walter E. Chandler will welcome the AMERICAN CHEMICAL SOCIETY to Memphis on the opening day of its meeting, April 20. This welcome from the Mayor of our host city carries special significance. Mr. Chandler, at the request of the AMERICAN CHEMICAL SOCIETY, through the good offices of G. Worthen Agee, introduced House Bill No. 7709 in the 1st Session of the 75th Congress, and this bill gave national incorporation to the AMERICAN CHEMICAL SOCIETY. An identical bill was introduced at the same time by Senator Walter F. George as Senate Bill No. 2633. Both bills were considered by appropriate committees, Mr. Chandler himself being a member of the Judiciary Committee of the House to which his bill was referred. With the aid of recommendations from the War Department, Navy Department, Department of Commerce, Department of the Interior, and Department of Agriculture, the bills were passed by the House and Senate, the first known as the Chandler Bill and the second as the George Bill. On the final day of the session, the Chandler Bill was, by unanimous consent, substituted for the George Bill in the Senate and was passed by Congress and then signed by the President on August 25, 1937. Thus, it was the Chandler Bill, substituted for the identical George Bill, which gave the AMERICAN CHEMICAL SOCIETY the privileges it now possesses and which have added much to its opportunities for usefulness. The gratitude of the AMERICAN CHEMICAL SOCIETY to both Congressman Chandler and Senator George, and to others of the Judiciary Committee who aided in its passage, has often been expressed, but it is again emphasized as Mr. Chandler himself will welcome us to Memphis.

CHARLES L. PARSONS, *Secretary*

Borden Award Goes to Holm

George E. Holm

THE $1,000 Borden Co. Award for Research in the Chemistry of Milk for 1942 will be presented to George E. Holm, senior chemist, Research Laboratory, Bureau of Dairy Industry, U. S. Department of Agriculture, at the general meeting of the AMERICAN CHEMICAL SOCIETY in Memphis, April 20. This award is made to Dr. Holm in recognition of his contributions to the understanding of the basic causes and the control of oxidative deterioration of fats and oils, and to the prevention of spoilage of dairy products caused by oxidation of milk fat; and because of the broad scope and important applications of his researches on the constitution and reactivity of fats and of other compounds of milk.

Evans to Receive Eli Lilly and Company Award

UNDERWOOD & UNDERWOOD

Earl A. Evans, Jr.

THE 1942 Eli Lilly and Company Award in Biological Chemistry is to be awarded to Earl Alison Evans, Jr., Department of Biochemistry, University of Chicago, at the general meeting of the AMERICAN CHEMICAL SOCIETY in Memphis, April 20.

Dr. Evans' work falls primarily into three groups:

The first is concerned with the chemistry of insulin with Dr. Jensen, and the mechanism of the action of toxins with the late J. J. Abel. This was followed by a period during which he worked with the late Rudolf Schoenheimer on the chemistry of sterols and fat metabolism in which deuterium was used as an indicator.

Dr. Evans then entered the field of biological oxidations and intermediary carbohydrate metabolism—a field in which his contributions have been outstanding. Of particular importance has been his study in recent years of the role played by carbon dioxide in the synthesis of alpha-ketoglutaric acid from pyruvic acid in vitro. In this work he has utilized the shortlived radioactive carbon isotope, carbon 11. He has demonstrated quantitatively that carbon dioxide assimilation in pigeon liver is an enzymatic reaction. This work quite revolutionizes our thinking about the role of carbon dioxide in the animal economy.

It is in recognition of his contributions to those fields of endeavor that Dr. Evans has been selected to receive the award.

Web Jones

Tune—"Comin' through the Rye"

We'd like to sing a little thing
It's called biography
In sweetest tones we page Web Jones
Who comes from Car-ne-gie.
'Tis told in tales of far-off Wales
The Joneses were prolific
We'd like to sing of one of them —
Web Jones—to be specific.

Now here's his history
As briefly as can be
Of our guest of tonight
A few facts of his life, of his life.

Have you ever seen a Missouri coal mine?
Not I! Nor have I.
Web dug one out in his prime.
He did? That's no lie.
He and his mule would dig the fuel
In tunnels dark they'd creep
He learned a-plenty from
that mule
Oh, his studies went down
deep.

And he lives down in our
alley.

He learned a great deal 'bout
human nature—
Who from? From the mule!
That's why he's such a
human creature
Web Jones is no fool.
He'll talk with you, he'll
laugh with you,
In poker he'll take all your
dough,
For when he turns his hole
card up—
Five aces in a row.

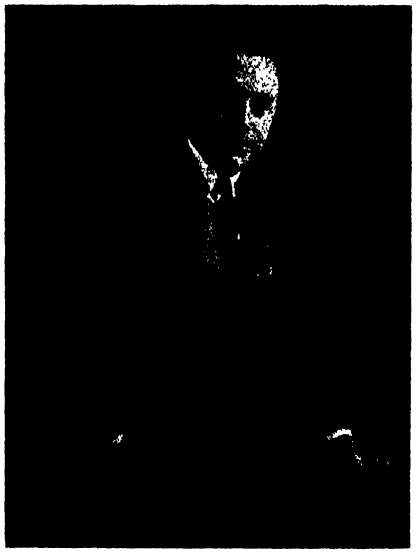
That only goes to show—
(And this we should repeat)
That Webster here is un-
abridged—
He can't be beat.

He's saved many men from
unemployment—
He has? Yes, indeed.
And that's where he gets his enjoyment—
Yes, sir, that's his speed.
In teaching he can inspire the slow
In practice he has no peer
He's an ace in the deck of Carnegie Tech
And a helluva engineer.

A helluva good engineer
He works without favor or fear
And when he gets up on his feet tonight
What he says will be something to hear.

He's a man among men,
Good with arm, tongue, and pen,
And that is the reason, the reason why

He's given the Pittsburgh Award.



Hillebrand Prize Awarded to M. X. Sullivan

THE Hillebrand Award of the Chemical Society of Washington has been won this year by Michael Xavier Sullivan, director of the Chemo-Medical Research Institute of Georgetown University. This award, named for the scholarly and distinguished chemist, William Francis Hillebrand, long chief chemist of the National Bureau of Standards, is given each year by the Washington Section of the AMERICAN CHEMICAL SOCIETY to a member of that section for an outstanding original contribution to the science of chemistry during the three preceding years. Although Dr. Sullivan's research work has been extensive in biological chemistry, the award was made for his work on the development and quantitative application of highly specific tests for important constituents of plants and animals, especially for valuable contributions to the biochemistry of sulfur with special reference to the quantitative determination of biologically important compounds. The presentation of the award was made the Cosmos Club on March 12.

The award was accepted by Dr. Sullivan for himself and his associates as a mark of appreciation that biochemical tests,

Webster N. Jones (*left*) receives the Pittsburgh Award from J. C. Warner, Chairman of the Pittsburgh Section of the AMERICAN CHEMICAL SOCIETY, donor of the tribute, at a special dinner meeting of the section in the University Club, February 19. Dr. Jones is director of the College of Engineering, Carnegie Institute of Technology.

UNDERWOOD & UNDERWOOD

M. X. Sullivan

despite the great complexity of the biochemical field, can be made as exact as tests in other fields of chemistry.

The award was made for 17 papers published in the *American Journal of Surgery, Journal of Biological Chemistry, Journal of the Washington Academy of Sciences, Journal of Agricultural Research,* the *Proceedings of the Society for Experimental Biology and Medicine,* and the *Journal of the American Chemical Society.*

E. J. Barth, petroleum technologist, has recently joined the research and development staff of the National Oil Products Co., Harrison, N. J.

Sets of Abstracts

As usual, sets of abstracts of meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about April 15, and will also be on sale at Memphis, Tenn.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

The Western New York Section of the American Chemical Society has for its objectives increasing interest in chemistry by providing opportunities for its members to meet together to discuss subjects of chemical interest; by encouraging the dissemination of general chemical knowledge within its boundaries; by cooperating in a professional advisory capacity with local civil officers and civic bodies, when desired; and by always promoting the interest of the A. C. S.

Although more than 500 members come from Buffalo and Niagara Falls, N. Y., chemists in Erie and Niagara Counties of New York State and the County of Welland in the Province of Ontario, Canada, are eligible to membership. Membership is made up of members, associate members, and student members. There are very few associates, however.

The organization of the section is as follows, and, unless otherwise noted, officers serve one year (September to September): a chairman; a vice chairman from the Buffalo district; a vice chairman from the Niagara Falls district; a treasurer (two years); a secretary (two years); councilors (January to January); an editor for the self-supporting section publication; a business manager for this publication; and a board of trustees for the endowment fund.

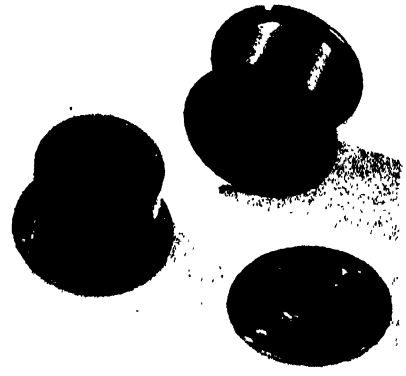
All business of the section is conducted by the executive committee, which is made up largely of officers and committee chairmen. The appointed committees include: program, arrangements, membership, publicity, public relations, education, auditing, and nominating.

The membership is kept vitalized by:

Publicity given in the section publication, *Double-Bond,* which outlines the many advantages of membership in the A. C. S.

Public announcement made at each November meeting covering the desirability of starting all memberships in January.

Key men appointed as contacts in every academic and industrial institution in the section to "spot" likely candidates.



The chairman of the membership committee maintaining an accurate, up-to-date record of the affiliation of each member, as well as his or her correct address.

Publication of a list showing the membership at each industrial or academic institution.

Meetings, preceded by a dinner, are held monthly, except during June, July, and August. Generally a guest dinner speaker is provided from an abundance of local talent. He briefly covers some non-chemical subject of general interest. This feature tends to increase the attendance at the dinners. The speakers at the meetings which follow are largely nationally known chemists or other scientists, and the program committee expenditures approximate $250 a year. This section does not usually rely upon the home office to supply speakers. The average attendance approximates 300. The local membership of the American Electro-Chemical Society quite often meets with the section, and contributes to its financial support.

Certain special features in the Western New York Section are worthy of mention:

1. A gold medal has been presented by this section to some distinguished citizen each year since its founding in 1930. A fund was made available by Jacob F. Schoellkopf, Sr., which has provided an income sufficient to cover the cost of the presentation of such a medal each year since that date.
2. A substantial permanent endowment fund is maintained by the section and administered by three trustees, elected to office. This fund is totally separated from all other money.
3. For several years the section has been invited to hold its March meeting at Niagara University, where a capacity attendance is always assured because of the generous hospitality shown the section by this institution.
4. An important feature of this section is its publication, the *Double-Bond.* This has been recognized for years as one of the outstanding monthly bulletins published by any local section, and the contributions made by the graphic editors particularly have received much favorable comment.—Albert E. Jennings, *Western New York Section.*

Spool for Tungsten Wire

A plastic application which helps to conserve aluminum for other essential uses is the new tungsten wire spool developed by Callite-Tungsten Corp., Union City, N. J. The spool is molded by Universal Plastics Corp. from Bakelite phenolic material in two sections at a 20 per cent reduction in cost. The two tight-fitting halves are cemented to ensure a permanent bond.

THE CHEMIST'S CHANCE

OTTO EISENSCHIML, The Scientific Oil Compounding Co., 1637-55 South Kilbourn Ave., Chicago, Ill.

Editor's Note. We are privileged to reprint from the *Chemical Bulletin* the following discussion by Otto Eisenschiml, "The Chemist's Chance". We do this because we consider the topic a timely one, out of which the greatest good can be obtained by a thorough-going discussion. Brief comments are invited, and though we cannot promise in advance to devote the space that might be required to print in full all opinions received, we will do what we can to place before our readers the best that may be stimulated in the minds of chemists on what is to most of us a most interesting question.

WHEN the first World War got into its stride, America discovered that it had in its midst a professional class known as chemists. A hazy idea that such people existed had been in the popular mind before, but to the average man a chemist was just a bewhiskered old man holding a test tube against the light or carrying on distillations from medieval-looking retorts for no apparent reason. Now it developed that chemists made food products, aniline dyes, ammunition, and poison gases. Ignorance changed to curiosity, curiosity to respect. The day of awakening had come.

Soon after we entered the war, the relative value of men to the community at large became more closely defined. Obviously, our human society consisted of people who produced and people who talked. Talk would win no wars; what the country needed was production, more production, better production. The genius of the chemist was requisitioned for both quantity and quality of output, for innovations, for improvements. America at war could get along without salesmen, brokers, advertising men, even without lawyers; but it could not get along without chemists. The vital functions of the national body were thus quickly divided from the superstructure of nonessentials. Chemists were not permitted to go to the front, regardless of their wishes, because they were doing vital duty on the home front. The forgotten men suddenly found themselves marching at the head of the procession.

By the time the war ended America had learned the value of research chemistry. However, lasting gain came to chemistry rather than to chemists, for with the advent of peace the noncreative members of society quickly resumed their former position of prominence. The wide acclaim of what chemistry meant for progress had not redounded permanently to the benefit of the profession, certainly not to its financial benefit; had it done so, the AMERICAN CHEMICAL SOCIETY would not find it necessary to take a stand on unionism and to sponsor a census of remunerations paid to its members.

In my opinion the monetary rewards of professional men go hand in hand with the respect in which they are being held. The two factors are inextricably interwoven. If we are to raise the pecuniary standard of chemists, we must also raise their social standing. The highest paid chemists employed by state governments receive about one fourth of the salary paid to a chief justice. This ratio holds also for the Federal Government. It evidently represents the relative esteem with which the public regards the legal and the chemical professions. So long as this ratio prevails, efforts to better the status of chemists are not likely to be uniformly successful.

Big brains are attracted by big incomes; men of caliber will go where they find the best market for their talents. In achieving a higher financial status for chemists we are doing more than raise their income; we are also raising the living standing of the Nation. With all due respect to lawyers, no one but the contestants cares who wins the lawsuit of Jones *vs.* Smith; and if some legal star keeps murderers from the gallows, the community owes him no thanks. If clever advertising makes Black's pain killer sell better than White's, it is of interest only to Mr. Black and Mr. White. But if a chemist, in the ordinary course of duty and without altruistic thoughts in his mind, works out improvements and savings, or adds to our health, wealth, and comfort, he contributes something of value to the entire world. Hence, the desirability of attracting big brains to the study of chemistry rather than to the study of law or other noncreative occupations.

I believe that in any consideration for fair compensation, routine analytical chemists should be classed by themselves. Routine analytical work can be done by technicians; that many college graduates are doing it now proves only that employers are not so well informed as they should be and that chief chemists, perhaps prompted by an esprit de corps, are doing nothing to enlighten the front office The passing on of routine analytical work to skilled artisans is an inevitable economic development which the profession should face squarely and which should also be considered in the curricula. When I think of the number of hours I spent in the analytical laboratory during my student years, I could weep. The entire field of routine analysis should be left to technicians, much as the temperature of patients is taken by nurses and not by surgeons.

So far as routine analysts are concerned, I see no objection to an endeavor to establish minimum salaries by law. I do not think the plan will work, for if the supply of chemists continues to exceed the demand, as has happened frequently in the past, all artificial props will sooner or later give way. Even the strongest unions could not control wages during the depression, when there was not enough work to go around. That human laws are only on safe ground if they conform to economic laws is a truism which it might be well for us to heed.

Our principal efforts should be directed towards more equitable compensation for the main body of chemists, for research workers, industrial chemists, teachers, chemists in business for themselves. In line with the thought previously expressed, I would like to see a sensible regulation of the supply of chemical students; not through legal means, but through a campaign of education. Scarcely one chemical student in a hundred knows what he is letting himself in for when he enters college; nor does he know how to gather relevant information. Most prospective chemists are like men who, sight unseen, buy a farm in a distant part of the country without knowing what the farm will produce, and whether its products can be advantageously sold. The price students pay for this education is several of the best years of their lives. I have advocated before, and I advocate now, lectures to chemical classes on the business side of chemistry. These lectures should not be delivered by teachers, but by practicing chemists who had best be chosen by the students themselves. I would suggest straight-from-the-shoulder discourses by chemists of all types, old and young, successful and otherwise. After listening to the voice of experience, let the would-be chemists form their own opinions whether they want to go into chemistry or not.

With production again under the lash of urgent necessity, chemists will do wonders once more. They will improve products and find substitutes. This progress should now be dramatized and brought before the public, not in chemical journals but on the front page of newspapers. Let the AMERICAN CHEMICAL SOCIETY use its News Service as it never has used it before. A victory on the production front is headline news to every American. If this publicity is handled with skill, the interest in chemists and in what they do should carry through into peace times and help create a better understanding and a stronger demand for creative chemical services.

The financial status of the profession

in the immediate future need not cause anyone great worry. So long as the war lasts, chemists will be in demand and remunerations will run high. Now is the time, however, to raise their social status.

Lest anyone should doubt that we are still unknown soldiers, let him ask any of his friends how many chemists he knows; if he can name three, I shall be greatly astonished. Let him look over the lists of prominent men being polled by newspapers on questions of the day; how many chemists will he find? Who knows or cares to know who gave to the world aspirin, ethyl gas, or concrete? People talk glibly about insulin and sulfa-compounds, vitamins, and plastics, but they never inquire who the chemists are who originated these products, nor do I remember seeing their pictures in any advertising literature. If history repeats itself and chemists come again to the fore in this war, I hope the AMERICAN CHEMICAL SOCIETY will do its utmost, not only to emphasize chemical achievements, but also to publicize the names of the men behind them. Perhaps we shall yet see the day when schools, parks, or streets are named after chemists rather than after dead real estate speculators.

If we chemists wish to better our lot, we must dig down to the roots of whatever evils we are afflicted with. Unless we do so, we shall continue to harvest sour fruits. Above all, we should at last be recognized, socially and financially, as one of the highest rating professions in our present social order. If we slip up on our chance this time, we shall have no one to blame but ourselves. We may not be given another chance like this in our generation.

Magnesium from Dolomite by Ferrosilicon Reduction

D. H. Killeffer, Contributing Editor, 60 East 42nd St., New York, N. Y.

MOUNTING demands for magnesium for war purposes continue to emphasize interest in new processes for its production. Latest of these employs ferrosilicon to reduce calcined dolomite to free metallic magnesium which is then distilled from the reacting mass. Production of the light metal in the United States has so far been limited to the electrolysis of magnesium chloride obtained from natural brines and from sea water [NEWS EDITION, 19, 1189 (Nov. 10, 1941)] together with small amounts from the Hansgirg process based on the reduction of calcined magnesite with carbon [NEWS EDITION, 19, 839 (Aug. 10, 1941)].

A new ferrosilicon process has been developed by L. M. Pidgeon, of the Canadian National Research Council. Pidgeon found that the reaction between ferrosilicon and magnesium oxide proceeds smoothly at practicable temperatures under vacuum in the presence of calcium oxide. Metallic magnesium distills readily at the reaction temperature and condenses in extraordinary purity as a crystalline lining in a condenser tube connected with the reaction retort.

The process consists of briquetting ground ferrosilicon (75 per cent or higher silicon content is preferred) with dead burnt dolomite and heating these briquets in an alloy steel retort to about 1,150° C. The retort is constructed with an integral condenser tube into which a removable, tubular steel lining fits. The retort and condenser are evacuated to low pressure (a fraction of a millimeter), and as the reaction proceeds, pure metallic magnesium condenses in the lining of the condenser. At the end of the run—including time for evacuation, the cycle is about 6 hours—the condenser liner is removed with its accumulated magnesium. Differential contraction of the steel and magnesium breaks the two apart and the magnesium "pipe" is ready to go to the foundry without further purification or treatment. The retorts used resemble those of the zinc industry and can be heated in any convenient manner, using gas, coal, or electric heat.

The advantages claimed for this process are several. The process equipment is comparatively simple: cast alloy steel retorts which embody a minimum of machine finishing, furnaces for heating the retorts, and vacuum pumps to evacuate them. Dolomite is plentiful and easily calcined in standard lime-kiln equipment. Ferrosilicon is made in this country on a huge scale in standard electric furnace equipment from plentiful raw materials. The reaction proceeds smoothly without hazard. No evolution or handling of gases is involved, and when the retorts are opened, the magnesium is in solid massive form precluding the possibility of explosion or fire. Special emphasis is placed on the relatively low investment in plant required and on the speed with which units can be built in the present emergency. Furthermore, pilot plant operation to date has amply proved the process, and construction of production plants is already under way.

Several companies have become actively interested in putting this process to work. In Canada, Dominion Magnesium, Ltd., is operating a pilot-scale plant. This operation is in process of being enlarged to 10 tons per day. The process depends on the simple reaction between magnesium oxide and elementary silicon contained in ferrosilicon:

$$2MgO + Si = 2Mg + SiO_2$$

Subsequent reaction between the SiO_2 formed and the calcium oxide of the charge forms infusible dicalcium silicate that can be easily removed from the retort at the end of the run without slagging. No gas is evolved or involved in the process. Based on this reaction, each pound of silicon in the charge should theoretically produce 1.73 pounds of metallic magnesium. In terms of 75 per cent ferrosilicon, each pound of magnesium produced requires practically 1 pound of alloy

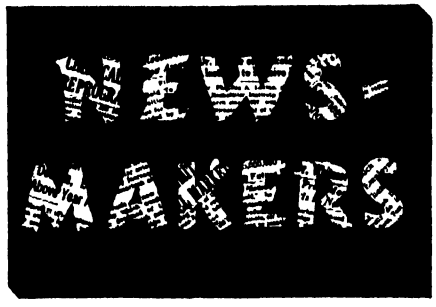
The simplicity of the operation depends further on the fact that a powerful reducing agent, ferrosilicon, is supplied to the process. This must be manufactured elsewhere, and although the raw materials required for it are plentiful, the energy needed is high and the demand for the product by the steel industry is great. Production of ferrosilicon of all grades in the United States in 1940 was 406,699 net tons. The average silicon content of this entire output was 28 per cent. Included in the total are alloys containing as little as 7 per cent and as much as 95 per cent elementary silicon. The lower grades were produced in blast furnaces, whose total output was 190,310 tons. Electric furnace operation supplied 219,141 tons of higher concentration alloys and 248 tons were produced as a by-product of electric furnace abrasives. Present rate of production is over 700,000 tons per annum.

Because of the need for ferrosilicon in war work, the present fixed price ceiling for the 75 per cent grade is $135 per net ton. On this basis and assuming that ferrosilicon of the required grade is available in sufficient quantity, the cost of magnesium by the Pidgeon process should be well below the present market price of 22.5 cents per pound.

When these facts are considered with the obvious advantages of the process and the further consideration that the operation can be carried out in relatively small and widely distributed units, the desirability of utilizing ferrosilicon as a reducing agent with dolomite in the expanded magnesium program at once becomes patent.

Furst Retires after Serving 49 Years

Edward W. Furst (*center*), general manager, Grasselli Chemicals Department, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., will retire April 1 after 49 years of service. Mr. Furst was vice president and member of the Executive Committee and Board of Directors of the Grasselli company when it was acquired by du Pont in 1928. In 1936 he was elected president and shortly thereafter received appointment as department general manager upon the Grasselli Chemical Co.'s reorganization as a du Pont manufacturing unit. Emmet C. Thompson (*left*), present assistant general manager, will succeed to the general managership. Clark W. Davis (*right*), manager of the du Pont Military Explosives Division, is to become assistant general manager.



1942 Phillips Medalist Named

THE 25th annual award of the Francis C. Phillips Medal in Chemistry at the University of Pittsburgh was made to Hershel Markovitz on March 4 for highest honors in the course leading to the bachelor of science degree in chemistry.

Mr. Markovitz graduated from McKeesport Technical High School in 1938 with first honors and was awarded the Rensselaer Polytechnic Institute Medal and an honor scholarship for the University of Pittsburgh, which he entered in the fall of 1938. In his freshman year he was elected a member of Phi Eta Sigma, honorary men's freshman scholastic fraternity. At the end of the sophomore year he received the Phi Lambda Upsilon Prize in chemistry. At the end of the junior year he was granted a membership in the AMERICAN CHEMICAL SOCIETY for highest honors in the first three years of his course. He is also a member of Sigma Pi Sigma, honorary physics society; Phi Lambda Upsilon, honorary chemistry society; and Pi Tau Phi, honorary scholastic fraternity. He is president of the University of Pittsburgh Student Affiliate chapter of the AMERICAN CHEMICAL SOCIETY.

Mr. Markovitz has just been awarded a Charles A. Coffin Foundation Fellowship for study in Columbia University.

C. E. Watts, formerly research analyst with the Commercial Solvents Corp., Terre Haute, Ind., who is a reserve officer on active duty with the Ordnance Department, has been promoted to the rank of lieutenant colonel. Colonel Watts is chief of the Artillery Ammunition Branch, Inspection Section, Ammunition Division, Social Security Building,. Washington, D. C.

Elton R. Allison has been appointed to the chemical staff, Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D. C., in charge of matters pertaining to inorganic chemicals. He was formerly a member of the research staff, Lion Oil Refining Co., El Dorado, Ark.

Ralph W. Berger has resigned from the Delco-Remy Division of the General Motors Corp., Anderson, Ind., to become a research chemist in du Pont's Pioneering Research Section, Technical Division, Rayon Department, at Buffalo, N. Y.

Jerome L. Boyer has been appointed director of technical sales of Newport Industries, Inc., succeeding **E. V. Romaine.** Mr. Boyer has been on the technical staff of Newport Industries and associated companies since 1929.

B. T. Brooks has been appointed to assist **Morris L. Cooke** in the settlement of the dispute between the Mexican Government and American oil interests in Mexico. Mr. Cooke was appointed by President Roosevelt, and the President of Mexico has also appointed a representative to serve for the Mexican Government. The committee is meeting in Mexico City during March.

Claude F. Davis has been added as chief chemist to the staff of Schwarz Laboratories, Inc., 202 East 44th St., New York. Mr. Davis was recently associated with the Michigan Bakeries, Grand Rapids, Mich.

John A. Finley, formerly associated with the Carnegie-Illinois Steel Co., has been named a research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to research in metallurgy.

Harold A. Frediani has been transferred from the Development Laboratory of the Fisher Scientific Co. to its affiliated organization, Eimer and Amend, New York, N. Y., as chief chemist in charge of research, control, and production.

William B. Fulton, senior surgeon in the U. S. Public Health Service Reserve and a former director of the Bureau of Industrial Hygiene of the Pennsylvania Department of Health, has been appointed chief of the Health Division, U. S. Bureau of Mines. Dr. Fulton will direct the expanding activities in safeguarding the physical welfare of workers in the Nation's mineral industries.

Gordon L. Goerner, formerly on the staff of Defiance College, Defiance, Ohio, will take over new duties as instructor of chemistry at Michigan State College, East Lansing, Mich., on April 1.

Louis M. Heil, research associate in science at the University of Chicago, has been appointed to head the department of physics at Cooper Union, New York, N. Y., with the rank of full professor. Dr. Heil will succeed **Albert Ball,** who retires on June 30, after 37 years of service.

Francis B. Hillhouse, employed by the National Aniline and Chemical Co. since 1927, has been appointed to the Chemicals Staff of the Bureau of Foreign and Domestic Commerce. He will be associated with J. N. Taylor in the Organic Chemical Section and will serve under C. C. Concannon, chief of the Chemicals Staff and industrial consultant on chemicals.

Ernest E. Hubert, since 1935 research pathologist for the Western Pine Association, Portland, Ore., has been appointed to the research staff of I. F. Laucks, Inc., manufacturing chemists, Seattle. He assumed his new duties March 16 at the Seattle headquarters of the company where he will work in a new laboratory confined to problems of wood preservation and wood utilization. Dr. Hubert is chairman of the Pre-

servative Standards Committee of the National Door Manufacturers Association, and has been responsible for the development of basic testing methods for water-repellent solutions and the establishment of toxic standards for wood.

Nicholas L. Kalman, formerly with Arthur D. Little, Inc., joined the staff of Ridbo Laboratories, Inc., 113 East Centre St., Nutley, N. J., as director of organic research.

Paul Keller has been appointed to manage the sales of tool, stainless, and special steels for the Copperweld Steel Co., Warren, Ohio.

Lieutenant Allen R. Kittleson, a personnel officer with the Supply Battalion, Sixth Armored Division, formerly at Fort Knox, Ky., has been at Camp Chaffee, Ark., since March 15.

Mark F. Litteken has been appointed a junior engineer at the Aberdeen Proving Ground, Aberdeen, Md., to serve in the capacity of proof director.

George L. Parkhurst has recently resigned as Chairman and Councilor of the Chicago Section, AMERICAN CHEMICAL SOCIETY, because of his appointment to the Office of Petroleum Coordinator for National Defense. He is on leave of absence from his duties as senior attorney in the Patent and Development Department, Standard Oil Co. (Indiana). **Warren C. Johnson,** University of Chicago, has assumed the chairmanship of the section.

Bryant W. Pocock, formerly chemical research engineer for the Michigan State Highway Department, has accepted the position of chief chemist for the Nash-Kelvinator Corp., Propeller Division, Lansing, Mich.

John A. Riddick and **George E. Hines** of the Commercial Solvents Research Department recently reported for active duty with the Army.

Daniel B. C. Rivkin has been made professor of chemistry and pharmacy and appointed head of the School of Pharmacy, Southwestern Institute of Technology, Weatherford, Okla. The school will occupy the second floor of the new administration building, which is to be completed June 15.

Ludwig Rosenstein, formerly of the Shell Chemical Co., is now associated with the General Chemical Co.

John S. Rovey, formerly of Ingram & Bell, Ltd., Montreal, Canada, has become associated with Arthur S. LaPine & Co., Chicago, Ill.

Bernard Gary Silvers, B.S. 1941, Illinois Institute of Technology, has recently joined the Edwal Laboratories staff, Chicago, Ill.

Sol Smith has accepted a position as assistant chemical engineer with the Chemical Warfare Service and is located at Huntsville Arsenal, Huntsville, Ala. He formerly was district engineer with the Railroad Commission, Wichita Falls, Tex.

C. G. Storm, for many years chief of the Explosives Section, Ordnance Department, Washington, D. C., has been released by the War Department to become technical assistant to the vice president and general manager of National Fireworks, Inc., West Hanover, Mass. This company is now engaged in the manufacture of munitions on a large and imposing scale. It was deemed that Dr. Storm was needed more for this particular job than in the work in the Ordnance Department in which he has been engaged for many years.

Columbia Receives Grant from Swift

COLUMBIA UNIVERSITY has received from Swift & Co., Chicago, a grant to be used to carry on fundamental studies on protein enrichment of the dietary as related to phosphorus and riboflavin requirements. This work will be carried on by H. C. Sherman, A. W. Thomas, and M. L. Caldwell, all of the Department of Chemistry. Dr. Sherman is an authority in nutrition and has done considerable work on vitamins and minerals in nutrition. The proposed studies will involve determination of the effect in the diet of additional amounts of protein, phosphorus, and riboflavin, separately and together, on rates of growth, adult physique and vitality, and composition of body tissues.

Officers of Nutrition Foundation Chosen

GEORGE A. SLOAN, Commissioner of Commerce of New York City and former president of the Cotton Textile Institute, has been named president of the Nutrition Foundation, Inc., recently founded by a group of food industries to develop and apply the science of nutrition for the improvement of the diet and health of the American people. Charles G. King, of the University of Pittsburgh, has been made scientific director in charge of research. Karl T. Compton, president of the Massachusetts Institute of Technology, is chairman of the board of directors. Ole Salthe has been appointed executive secretary. Mr. Salthe resigned his position as consultant of the Food and Drug Administration to accept appointment with the foundation.

Sixteen food companies have subscribed $800,000 for the work of the new organization.

Texas Division of Monsanto

FORMATION of the Texas Division of the Monsanto Chemical Co. has been announced. The division will have under its jurisdiction a plant to be operated for the Ordnance Department of the United States Army, and a plant to be operated for the Rubber Reserve Co., a federal agency. Under war censorship, locations of the plants cannot be given.

Osborne Bezanson, Woburn, Mass., has been appointed general manager of the division with temporary headquarters in St. Louis.

David L. Eynon, Jr., of Boston, has been named resident manager of the Ordnance plant, and Ralph W. Booker, formerly in charge of construction at Trenton, Mich., has been appointed project manager in charge of construction of the Rubber Reserve plant.

David L. Eynon, Osborne Bezanson, and Ralph W. Booker

NECROLOGY

Thomas Warren Bollinger

THOMAS WARREN BOLLINGER, M.A., died July 31, 1941, after four and one-half months' illness of *Streptococcus viridans* infection, which went from throat to blood stream, causing endocarditis. He was 24 years old. He was educated at Swarthmore College, the University of Louisville, and Indiana University, doing his graduate work at the last named. He majored in mathematics and chemistry. He was first employed by DeVoe Raynolds, and later by Corhart Refractories Co., in Louisville, Ky., by the latter at time of his death, as a chemist.

Robert Bosch

ROBERT BOSCH, inventor of the Bosch magneto, died in Stuttgart on March 12, at the age of 81.

Dr. Bosch received his initial technical training in the United States, then went to England, where he was employed at the Siemens works at Woolwich. At the age of 25 he opened his own workshop in Stuttgart, and in 1901 developed the Bosch magneto and Bosch lamp, which were the foundation of his fame. His company came to have branches all over the world and before the outbreak of the present war employed 25,000 workers in his German plants.

Sir William Bragg

SIR WILLIAM HENRY BRAGG, corecipient with his son, William Lawrence Bragg, of the Nobel Prize in 1915 for work on x-rays and crystals, died March 12 in London at the age of 79.

Sir William was born July 2, 1862, at Wigton, Cumberland, England, and attended King Williams's College, Isle of Man, and Trinity College, Cambridge. He became professor of mathematics and physics at Adelaide, South Australia, in 1886, Cavendish professor at Leeds in 1909, and Quain professor of physics in the University of London in 1915. In 1920 he was created K. B. E. and was elected honorary fellow of Trinity College, Cambridge. In 1923 he was appointed Fullerian professor of chemistry at the Royal Institution and director of the Davy-Faraday research laboratory.

In 1915, the year in which he and his son received the Nobel Prize, he was also awarded the Barnard Medal by Columbia University. During the first World War he acted as adviser to the British admiralty, especially on submarine detection. During the present conflict he had served as chairman of a scientific food committee and was a member of the scientific advisory committee to bring to the attention of the British Government new developments in the field of science.

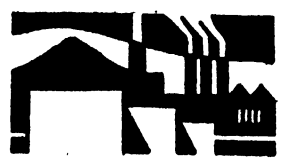
Sir William was the author of numerous scientific works, and was probably best known for his work in popularizing science. With his son he shared in the development of the x-ray spectrometer, which aided in elucidating the arrangements of atoms and crystals.

He had been president of the Physical Society of London and the British Association for the Advancement of Science. In 1930 an honorary membership in the New York Meteorological Society was presented to him.

Jesse Raymond Harrod

JESSE RAYMOND HARROD, professor and head of the Chemistry Department, Ohio Northern University, Ada, Ohio, died February 24, at the Lima (Ohio) Memorial Hospital. He was 56 years old.

Dr. Harrod was born in Allen County, Ohio. He received the B.S. degree from the Ohio Northern University in 1919, the M.S. degree in 1925 and the Ph.D. degree in 1933 both from the Ohio State University. He became a member of the Chemistry Faculty at the Ohio Northern University in 1921 and was promoted to chairman of the Chemistry Department and head of the Division of Science in 1930.



He was a member of the AMERICAN CHEMICAL SOCIETY for many years, of Sigma Xi, and the International Association of Torch Clubs. He was joint author of the "Outline of Organic Chemistry". Dr. Harrod was very active in community and university affairs. He was president of the Ohio Northern Choral Society for many years and took an active part in musical events.

Abraham B. Miller

ABRAHAM B. MILLER, naval stores development chemist with the Hercules Powder Co., died in Tuscaloosa, Ala., on February 19.

Mr. Miller, a graduate of Franklin and Marshall College in 1922, did graduate work at Columbia University and the University of Texas, and started work with the Armstrong Cork Co. Later he joined the staff of the Paraffine Companies, and in 1927 went to the Hercules Powder Co. At the time of his death he was employed at the experiment station in Hattiesburg, Ala.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1926.

Carl Pfanstiehl

CARL PFANSTIEHL, founder of the Pfanstiehl Chemical Co., died March 1 in Chicago at the age of 54.

Mr. Pfanstiehl was born in Columbia, Mo., September 17, 1888, and studied at the Armour Institute of Technology. While still in college he organized the Pfanstiehl Electrical Laboratory to manufacture gas engine ignition coils and x-ray apparatus on the basis of several patents. The company is now the Fansteel Metallurgical Corp. In 1918 he resigned to devote himself to research as head of the Special Chemical Co., of which the Pfanstiehl Radio Co. was a division. At the time of his death he was vice president and director of research of the Pfanstiehl Chemical Co. He had been granted about 130 patents on electrical, chemical, radio, and metallurgical inventions.

During the World War he did special research work for the War and Medical Departments of the Government, and in the present war had been conducting research for the Government at the Illinois Institute of Technology. He was the author of numerous scientific articles. In 1940 he received the Modern Pioneer Award of the National Manufacturers Association.

He was a member of the AMERICAN CHEMICAL SOCIETY, which he joined in 1914, Electrochemical Society, American Association for the Advancement of Science, American Physical Society, American Institute of Mining and Metallurgical Engineers, American Society for Metals, and an associate member of the Optical Society of America.

W. L. Scoville

W. L. SCOVILLE, head of the analytical department of Parke, Davis and Co., Detroit, until his retirement in 1934, died in Gainesville, Fla., March 10, at the age of 77. He was born in Bridgeport, Conn., where he began his pharmaceutical career in a drugstore. Later he entered the Massachusetts College of Pharmacy and received the degree of Ph.G. in 1889. He was professor of pharmacy at the same institution from 1891 to 1904. He was an analytical chemist in Boston from 1904 to 1907 when he went with Parke, Davis.

Dr. Scoville, was a member of the Revision Committee of the U. S. Pharmacopoeia from 1900 to 1940, and served as vice chairman of that committee in 1920–30. He was a member of the Committee of Revision of the National Formulary for the third, fourth, fifth, and sixth editions, being chairman of the fourth and fifth revisions.

Dr. Scoville was awarded many honors, including the honorary doctor of science degree from the Massachusetts College of Pharmacy in 1927, the honorary master

of pharmacy degree from the Philadelphia College of Pharmacy in 1929, the Ebert Prize in 1923, and the Remington Medal in 1929. He was an honorary member of the Pennsylvania Pharmaceutical Association and the Michigan Pharmaceutical Association. He had belonged to the AMERICAN CHEMICAL SOCIETY since 1905 and was also a member of the American Association for the Advancement of Science, and the American Pharmaceutical Association with which he was associated for more than 50 years. Dr. Scoville was the author of a widely used pharmaceutical textbook on the art of compounding.

Summer Variety in Pittsburgh

THE University of Pittsburgh will offer a variety of chemistry courses as to time required and credits offered. The purpose is to afford a speed-up and make chemists available for government service earlier than regular curricula permit. The plan includes:

Regular semester courses during the summer trimester of 16 weeks beginning June 5 in all branches of chemistry. The student may carry a full curriculum.

Twelve-week courses in elementary inorganic, organic, analytical, and physical chemistry beginning June 29. These cover an entire year's course in chemistry. Credit can be obtained for the full year or half credit during six weeks. The student may schedule one chemistry course and a nonchemistry course.

Eight-week courses in elementary inorganic and organic chemistry beginning June 29. These carry credit for a full-year course, and half credit may be obtained during four weeks. The student is limited to one course under this plan.

Kansas State College Offers Research Fellowships

THE Kansas State College is offering two research fellowships in chemical engineering for the fiscal year beginning July 1, 1942. The fellowships are for 12 months with one month's vacation, and carry a stipend of $750. Fellows must pay certain college fees amounting to about $75 for the year. Applications should be submitted before April 15 to W. L. Faith, Head, Department of Chemical Engineering, Kansas State College, Manhattan, Kans.

ESMDT Powder Metallurgy Course Offered

ANOTHER powder metallurgy course by W. J. Baăza under direction of Engineering, Science, and Defense Management Training will be given early in April at the College of the City of New York. The course will run for 10 weeks, two nights a week, probably Wednesday and Thursday, from 7:00 to 10:30 P. M. No tuition or other fees will be required of students. Early application should be made to the Director of ESMDT, College of the City of New York, 140th Street and Convent Avenue, New York.

Summer Courses at Michigan

MICHIGAN College of Mining and Technology, in line with a number of other colleges and universities, is announcing an expanded summer school program. More than 100 courses will be offered this summer designed to contribute to the victory effort. Virtually all departments will give work, and more than two thirds of the faculty members will be teaching. The session begins June 15 and ends September 4. Most courses run for twelve weeks, several for six, a few for other periods.

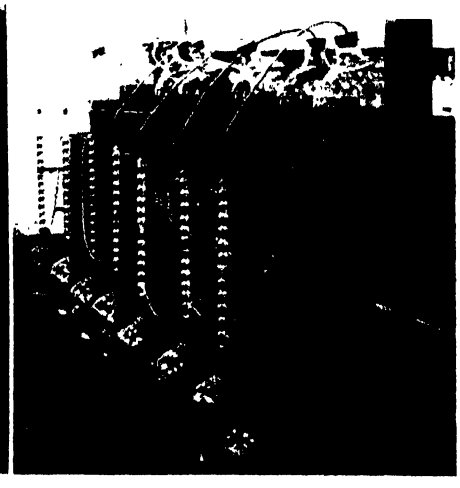
Prospective students are asked to write at once to the registrar of the Michigan College of Mining and Technology, Houghton. A formal bulletin will be published soon, giving details with regard to each course, fees, living facilities, and the Michigan Tech summer school faculty.

Penn State Turns to Harvard for Processing Plant Extracts

R. E. MARKER, Pennsylvania State College, collected some three tons of material on a recent trip to Mexico and Central America, returning it to State College for processing. The volume of material was such that large-scale methods of treatment were devised, as indicated by these illustrations. Remembering Dean Whitmore's background, it is not surprising to find a certain brand of garbage can employed, with two reflux condensers. The battery shows one quarter of the equipment required for the concentration of the plant extracts which had to be processed without loss of time.

Metallurgists Needed by Government

THE Civil Service Commission is seeking metallurgists for work in navy yards, arsenals, and other war agencies, in positions paying from $2000 to $5600 a year. Experience in metal-working industries with fabrication processes such as welding, die-casting, heat-treating, x-ray testing, and metallographic work is particularly desired.



Applications will be accepted continuously until further notice. The necessary forms may be obtained from the Secretary, Board of United States Civil Service Examiners, at any first- or second-class post office, from Civil Service District Offices, or from the United States Civil Service Commission, Washington, D. C.

100 Per Cent Pure Nitrogen Gas Flows from Well in Eastern Wyoming

PURE nitrogen gas flows from a recently drilled well in an eastern Wyoming ranch, Harold Cook, consulting geologist of Agate, Nebr., reports in *Science*. This is believed to be the first nitrogen gas well ever struck. The well was being drilled for water, Mr. Cook says, when it began to yield gas at a considerable pressure at a depth of only 156 feet. A sample sent to the laboratory of the U. S. Geological Survey at Casper, Wyo., for analysis was found to be 100 per cent nitrogen by J. G. Crawford, chemist of the laboratory.

Since an apparently large supply of pure nitrogen, all ready to use, may have value in the present war emergency, the new-found well has been shut down to conserve the gas until the best possible uses are developed.

POTOMAC POSTSCRIPTS

Allocations and WPB Actions

Aluminum Pigment and Aluminum Paint have been placed under a complete allocation system by the Director of Industry Operations, WPB. Order M-1-g requires specific authorization for the manufacture, use, or sale of aluminum pigment and aluminum paint, except in retail distribution to the ultimate consumer. Form PD-312 is provided for applications for use of aluminum pigment or paint, and manufacturers and jobbers are required to report stocks on hand monthly on Form PD-313.

Chlorinated Solvents. Fabricators of metals have been warned by the Chemicals Branch to investigate every possible cleaning method other than chlorinated solvents. A shortage in chlorinated solvents already exists, caused by the vast increase in metal fabricating, and the situation will grow worse. Manufacturers with war contracts will be affected as well as others, the branch pointed out, and continued extension of the use of chlorinated solvents will not be possible.

At least 30 per cent of the cleaning operations in the metals industry now being done with chlorinated solvents can be accomplished by the use of other materials, such as mineral spirits, nonchlorinated solvent–water emulsions, and alkalies.

Chlorine. Drastic restrictions on the use of chlorine have been imposed in an amendment to Order M-19, effective April 1. The order prohibits the use of chlorine or products containing available chlorine in the bleaching of foodstuffs, bleaching of wiping rags and waste, and the manufacture of cosmetics and toilet preparations. The amounts used in bleaching of textiles, shellac processing, laundry operations, manufacture of home bleaching preparations, and sanitation of private swimming pools are curtailed. Pulp and paper manufacturers are subject to the same regulations of Order L-11 under which they have been operating.

Producers of chlorine are instructed to make deliveries only on specific authorization of the Director of Industry Operations, with the exception of chlorine for water and sewage treatment.

They are required to set aside from each month's production 5 per cent for delivery on specific instructions and enough additional to meet their regular water and sewage treatment demands. Supplies for water and sewage treatment can be obtained in the same manner as in normal times. All other requests for delivery must be scheduled monthly and submitted to WPB for action.

Gas Masks. Manufacture or sale of gas masks and antigas devices for protection against enemy attack has been banned, unless the masks and devices are actually on order by agencies of the Government, including the Office of Civilian Defense, and are built to Army Chemical Warfare Service specifications. Limitation Order L-57, issued after consultation with the Chemical Warfare Service and OCD, is designed to halt a fast-growing sale of unapproved gas masks to the civilian population and to affect the most complete standardization possible. The order also prohibits delivery or sale of any laminated cloth, laminated glass or plastic lenses, metal buckles or buttons, primary or activated charcoal, rubber, synthetic rubber, or webbing, for use in unapproved masks. Masks manufactured for fire-fighting, mining, industrial, scientific, and similar nonmilitary purposes are not affected.

Producers who have manufactured or sold any unapproved gas masks or devices since January 1, or who had in their possession or under their control more than 10 such masks or devices on March 3 are required to report to WPB on Form PD-328.

The formula for the Chemical Warfare approved mask is confidential, and cannot be distributed through the industry, nor could private manufacturers obtain the requisite amounts of activated charcoal. The Government controls the principal supply for military needs.

Laboratory Equipment and Reagent Chemicals. Preference Rating Order P-62, designed to facilitate acquisition of material for production of laboratory equipment and reagent chemicals, has been extended to June 30. The order was scheduled to expire March 31. According to WPB's Safety and Technical Equipment Branch, further amendments to the order will be announced shortly.

Nonmetal Containers. Preference Rating Order P-79, designed to encourage use of nonmetal containers, has been revised and extended until June 30. The revised form brings paper containers within the order and permits producers of nonmetal containers to apply the ratings to obtain materials which can then be transferred to packers for assembly of knocked-down or unassembled containers. The order continues to aid operations of the cooperage, wooden container, and paperboard container industries. All of the nonmetal containers groups covered by the order may also use the A-5 rating to obtain tools used up in production, such as saws, bits, drills, and knives.

A rating of A-5, as in the original order, is assigned to deliveries of ferrous material, defined as products made principally from iron or steel, except wire, to which a rating of A-7 is now applicable. Under terms of the original order, deliveries of wire had only an A-8 rating. Producers are restricted in the application of the ratings to those quantities and kinds of ferrous materials specifically authorized for rating by the Director of Industry Operations on Form PD-82.

Operating Supplies to which a preference rating may be applied under the terms of Preference Rating Order P-89, covering maintenance, repair, and operating supplies for the chemical industry, have been redefined by an amendment to the order.

Ratings under P-89 may be applied only by firms which are given specific authorization with a serial number. Up to the present time no company has received permission to operate under terms of the order because applications so far received indicate that the order as originally issued was too broad in its coverage.

As defined in the amended order, operating supplies means any material which is essential to the operation of the producer's plant including, but not limited to, lubricants, fuels, catalysts, and small perishable tools. Specifically excluded are materials physically or chemically incorporated into the producer's products, and material other than catalysts which enters into the chemical reaction necessary to the manufacture of the producer's products. Washes, solvents, extractions, etc., are also excluded.

Rhodium. Because rhodium, one of the platinum metals, is needed to coat reflectors in antiaircraft searchlights, the Director of Industry Operations, WPB, has decreed it must come off jewelry. Order M-95 provides that rhodium, used to impart a nontarnishable finish to such articles as compacts and cigaret cases, may not be used from now on for that purpose, but an accompanying letter from the Director of Industry Operations authorizes jewelers to use up present stocks. Stocks must not be replenished

Price Regulations

Copper Scrap. Harshaw Chemical Co. has been authorized by OPA to pay 11.25 cents per pound, f. o. b. shipping points, for such special purpose copper scrap as it requires, according to an announcement issued in conjunction with an order under Revised Price Schedule 20. This is the fourth permission granted to purchasers of special purpose copper scrap. The other three are Metals Refining Co., Sherwin-Williams Co., and Superior Copper Products Co.

Originally the companies were authorised to pay the premium price for monthly amounts of scrap not in excess of their average monthly purchases during the preceding 12 months. Since WPB now is allocating copper scrap, the new order permits the companies to purchase in any month at the premium price an amount not in excess of the allocation granted them by WPB.

Lithopone. Permission to fulfill certain contracts at higher than established maximum prices for lithopone is granted in amendment 1 to Price Schedule 80. The amendment affects only lithopone in the hands of exporters and dealers or in the hands of a carrier or warehouse (owned or controlled by others than the person from whom it was purchased) prior to February 2 to meet contracts made by such dealers and exporters prior to February 2, the effective date of the lithopone price schedule.

Mercurial Compounds. Producers of mercurial compounds used in pharmaceuticals, explosives, germicides, paints, insecticides, and other products, have been asked by Price Administrator Leon Henderson in telegrams to maintain for 60 days prices in effect on February 25. The request also covered distilled and redistilled mercury.

Titanium Pigments. Amendment 1 to Revised Price Schedule 98, effective March 1, permits the American Zirconium Corp., Baltimore, one of five major producers of titanium pigments, to charge 1.5 cents per pound above the maximum price until May 2. The company produces various grades of titanium dioxide from ilmenite obtained from India. To obtain a necessary supply, it must pay $31.50 per ton for this ore. The company is developing a domestic source of supply, however, and the amendment permits the additional charge only until the domestic supply is available.

WPB Issues Report on Scarcity of Materials

THE first of a periodic series of provisional reports on the relative scarcity of certain materials has been issued by the Conservation and Substitution Branch of the Bureau of Industrial Conservation, WPB. Since the status of the listed materials and others as well is constantly changing in relation to supply and demand, similar reports will be issued at regular intervals.

The first group is made up of materials that generally are critically essential for the prosecution of the war. For these materials civilian industry must largely find substitutions.

Materials listed in the second group are also necessary for war production and essential industrial activity, but the supply picture is not so tight. Necessary civilian industry may obtain limited supplies from this group to replace unavailable materials, when specific cases are considered sufficiently important.

The third group includes materials that are more available for substitutions, although in no case can the supply be considered unlimited, since other factors than the material itself may determine the amount available.

Group I

Metals

Alloy steel
Iron alloys
Alloy steel
Wrought iron
Aluminum
Aluminum scrap
Cadmium
Calcium-silicon
Chromium
Cobalt
Copper
Copper scrap
Iridium
Lead
Magnesium
Nickel
Tin
Tinplate and terneplate
Tungsten
Tungsten (high-speed tools)
Vanadium

Chemicals

Alcohol, methyl
Chlorinated hydrocarbon refrigerants
Chlorinated hydrocarbon solvents
Chlorine
Diphenylamine
Formaldehyde
Paraformaldehyde
Hexamethylenetetramine
Synthetic resins therefrom
Phenols
Polyvinyl chloride
Sodium nitrate (pure)
Toluene

Miscellaneous

Agar
Asbestos (long fiber)
Burlap and burlap products
Cashew nut shell oil
Corundum
Cotton linters
Graphite (Madagascar)
Hemp seed
Jewel bearings
Kapok
Manila fiber and cordage
Pig and hog bristles
Rubber, crude, and latex
Chlorinated
Synthetic
Shearlings
Silk
Silk waste
Silk noils
Garnetted
Reclaimed silk fiber
Sperm oil
Tin cans
Titanium pigments
Tung oil

Group II

Acetone
Ammonia (anhydrous)
Antimony
Arsenic
Barium carbonate
Beryllium - copper alloys
Borax
Calcium
Carbon tetrachloride
Camphor
Casein
Glascine
Kraft paper
Citric acid
Coconut oil
Cork
Cotton duck
Cryolite
Diamond (industrial)
Diamond dies
Flax
Fish liver oils
Glycerol
Hides and leather
Iodine
Jute and products
Linseed oil
Manganese
Mercury
Mica splittings
Molasses
Molybdenum
Natural gas
Natural resins
Nylon
Parchment paper
Palm oil
Phosphorus
Platinum
Potassium perchlorate
Potassium permanganate
Quarts crystals
Quinine
Rape seed oil
Rayon
Rhodium
Rubber (reclaimed)
Shellacs
Sisal
Steel, carbon
Scrap
Spirits, distilled
Sugar
Tanning materials
Teak
Tetraethyllead
Titanium pigment
Vitamin A products
Wool
Zinc (all grades)

Group III

Substitute Materials

Asbestos (common)
Asphalt
Brick and tile
Cement
Ceramics
Clay
Coal and coke
Concrete
Cotton
Feldspar
Glass
Gold
Iridium (plating)
Lignin
Limestone and marble
Lumber and millwork
Mineral wool
Paper (except items (under II)
Paperboard
Plywood
Salt
Silver
Slate
Sulfur
Wall board
Wood and products
Wood flour
Wood fibers
Wood pulp

Materials Available in Varying Amounts for Substitutions

Ammonia (aqueous)
Bismuth
Cellophane
Cottonseed oil
Gypsum and products
Hair (cow, horse)
Palladium
Petroleum products
Crude oil
Gasoline
Lubricating oil
Paraffin
Plastics (cellulose, acetate, butyrate)
Rosin
Ruthenium
Silicon and alloys
Soybeans and products
Protein
Oil
Turpentine
Uranium

War Materials Presently Available for Substitution in Critical Civilian Industry

Basic low-carbon steel
Bessemer steel
Gray cast iron
Malleable iron

Managing Directors of General Aniline Appointed

ROBERT E. McCONNELL, Robert E. Wilson, George Moffett, and A. E. Marshall have been selected by the Secretary of the Treasury as managing directors of General Aniline & Film Corp. Mr. McConnell will act as president of the corporation and chairman of the new four-man board. He is the chairman of the Engineers Defense Board, and consulting engineer to the War Production Board.

Robert E. Wilson, president of the Pan American Petroleum and Transport Co., was formerly petroleum consultant to OPM and is now both chairman of the Committee on Petroleum Economics of the Petroleum Industry War Council and consultant to the National Defense Research Committee. A. E. Marshall, president of the Rumford Chemical Works, Rumford, R. I., has been connected with the manufacture of chemicals for the past 30 years. George Moffett, chairman of the Board of Corn Products Refining Co.,

has for some time assisted the Reconstruction Finance Corporation.

General Aniline & Film Corp. has been under supervision of the Treasury Department for several months. On February 17 the department took title to 97 per cent of the stock which was registered in the name of foreign nationals. General Aniline had previously been under German domination.

Alien Property Custodian Appointed

CONTROL of alien property in the United States has been given by President Roosevelt to Leo T. Crowley, chairman of the Federal Deposit Insurance Corp. Mr. Crowley will set up an office within the Office for Emergency Management. He will serve without compensation and retain his post with FDIC. The executive order leaves nominal control of the freezing of foreign funds with the Treasury Department, which had immobilized some $7,000,000,000 of such assets. The Treasury, however, will release foreign properties to the custodian on his request and their frozen funds will go with them.

The Alien Property Division of the Department of Justice will soon be transferred to the Office of the Alien Property Custodian. The division has been administering alien property seized by the Federal Government during the last war. A total of $69,000,000 worth of such property, including a $55,000,000 German special deposit account in the Treasury, is still being administered. In announcing the coming transfer of the Alien Property Division, Attorney General Biddle also said that the Department of Justice will assist the new alien property custodian in setting up his organization and in selecting a legal staff. Investigative work for the alien property custodian will be conducted by the Federal Bureau of Investigation, and the Department of Justice itself will assist Mr. Crowley in an advisory capacity on legal matters.

Alien property in care of the custodian during World War I totaled $500,000,000. Today it is 14 times that figure.

Production, Shipments, Stocks of Manganese Ore Gain

DOMESTIC production of manganese ore containing 35 per cent or more manganese (natural) during January 1942 was 11,700 long tons, shipments were 11,700 tons, and producers' stocks at the end of the month were 1,400 tons, according to the U. S. Bureau of Mines. In December 1941 production was 10,100 long tons, shipments were 9,700 tons, and producers' stocks at the end of the month were 1,400 tons.

Shipments in 1941 totaled 76,000 long tons, an average of about 6,300 tons per month. The rate of shipments averaged 3,344 tons monthly in 1940, when the total amounted to 40,123 tons.

Patents

A LARGE number of applications are being examined each week by the Patent Office Defense Committee. This committee examines the applications for patents which have been selected by the patent examiners as being of interest in national defense. The examiners are guided in their selection by information furnished them by the committee as to general fields in which national defense may be involved. It is desirable that secrecy orders should be placed on certain applications for patents and this is done by the Commissioner of Patents.

Inventors or their attorneys may notify the Commissioner of Patents of potential defense value of an application. This information will be considered by the Patent Office Defense Committee and will cause such applications to be given prompt examination by the committee. Such information is of considerable value in certain chemical cases where the potential war uses of a chemical are not disclosed in the application.

Inventors are urged to use due precaution in disclosing material pertaining to applications for patents now in the Patent Office as secrecy orders may be placed upon the application at a later date. This applies to company publications, scientific publications, etc.

Process to Slow Rubber Aging Patented

NEWEST result in the efforts to prevent aging in rubber is a process patented by Joseph R. Ingram, Monsanto Chemical Co., Nitro, W. Va., in which a coal-tar derivative, indene, plays the principal part. Indene, in the form of compounds with formaldehyde and related chemicals, is claimed to be a superior antioxidant. Mr. Ingram has been granted two patents, 2,274,367 and 2,274,368, on his process and its products. Rights have been assigned to Monsanto.

Patent for Sulfapyridine Assigned

U. S. PATENT NO. 2,275,354 on sulfapyridine (2-sulfanilyl aminopyridine) was issued to Arthur J. Ewins and Montague A. Phillips, as assignors to May & Baker, Ltd., of London, England, on March 3, 1942.

The chemical researches of Doctors Ewins and Phillips, working in the laboratories of May & Baker, Ltd., at Dagenham, England, led to the discovery of the remarkable antipneumococcic properties of 2-sulfanilyl aminopyridine, announced by Whitby in the May 28, 1938, issue of the *Lancet*. (For the sake of brevity, Whitby referred to the drug by its serial number, "M. & B. 693". Later it was officially designated as sulfapyridine.)

May & Baker were the first to make the now famous drug available to physicians in England, in 1938, and in the same year Merck & Co., Inc., Rahway, N. J., was licensed by the originators to manufacture and market the drug in the United States. During the succeeding period of clinical investigation, Merck & Co., Inc., was privileged to contribute sufficient quantities of sulfapyridine to clinicians throughout the United States to enable them to treat nearly 20,000 cases of pneumonia.

Drug Substitutes Authorized to Fill Gaps in Imports

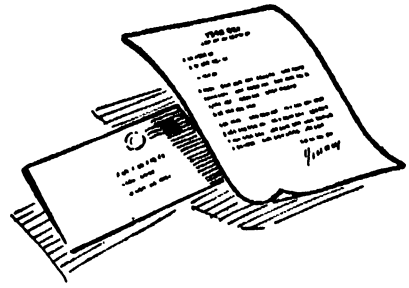
FIRST substitution of a domestic medicinal drug for one imported before the war has been authorized by the National Formulary and the U. S. Pharmacopoeia. The National Formulary authorized substitution of extract of stramonium for extract of belladonna in compound pills of cascara. The chief source of supply of belladonna was Belgium. Other alterations in drug preparations by the Formulary have so far been of a non-medicinal character. Permission is given to omit rose water, once imported from France, from cold cream. Use of distilled water in cold cream instead of rose water and persic oil, made from peach and almond kernels, in place of almond oil, is also permissible.

As a result of the shortage of oil of lavender, the U. S. Pharmacopoeia has authorized its omission in aromatic spirit of ammonia and substitution of oil of cedar leaf for oil of lavender in tincture of green soap. Because of scarcity of Mediterranean squill, an expectorant used in cough medicine, the Pharmacopoeia has recognized a variety of this drug which can be imported from India, *Unginea indica Kunth.*

Ergot, which comes from Russia and Spain, may be imported under less rigid packaging requirements, provided it is dried, assayed, and repackaged immediately after entry. Amaranth, a red coloring derived from coal tar, may be substituted for tincture of cudbear, standard red coloring once imported from Holland. Benzaldehyde is authorized by the Formulary as a substitute for oil of bitter almond as a flavoring agent in official preparations.

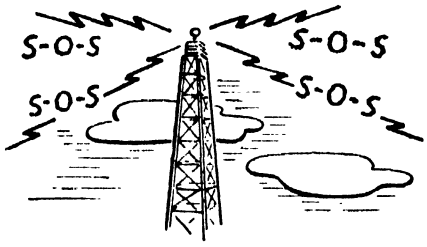
SODIUM sulfate production in Canada jumped from 1940's figure of 94,260 tons, valued at $829,589, to 124,762 tons, worth $924,000, last year, according to preliminary Canadian figures.

THE Cape Province of the Union of South Africa is the principal user of guano as fertilizer. Of a total distribution in all provinces of 52,846 bags, 49,813 bags were distributed there.



Welcome!

Memphis, Tenn., April 20-23, 1942



Now the SUBSTITUTE promises to OUT-PERFORM the material it replaced!

The first in a series of actual cases from the files of Monsanto's Technical Service Department which show how skill, experience and ingenuity can solve many of industry's critical wartime problems. For obvious reasons names and any clue which would identify the principals in the case have been omitted.

1. X, a Monsanto customer of long standing, opened his morning mail recently to find his continued business life suddenly threatened.

A certain chemical essential to his manufacturing process had fallen victim to priorities, was no longer available to him. Worse, he had only a slender supply on hand.

2. Now, X might have wired his Congressman or taken the next plane for Washington—but he didn't. And it wouldn't have helped if he had.

Instead, he sent an S. O. S. to Monsanto for technical service—and before his slender supply was exhausted, a new chemical had been found, tested, and put to work in his plant, ***where it fully equalled the old material and now gives promise of doing an even better job!***

3. Obviously not every problem handed to Monsanto Technical Service is so quickly solved—nor so happily. But the very breadth and variety of Monsanto's chemical manufacturing experience often gives its technical men a headstart toward a solution and with so many basic chemicals being drafted for the vital war program—technical service from your supplier often becomes as important as quality and uniformity in the chemicals he supplies!

A WORD ON QUALITY AND UNIFORMITY

Whatever troubles today's shortages may cause and however much they may wreck delivery schedules, there are two essentials you must be *sure* of getting in *every* shipment of chemicals that enters your plant—*quality and uniformity!*

That's why *every* batch of *every* Monsanto chemical is carefully controlled at *every* step in its manufacture . . . and *every* batch is *double-checked* in the control laboratory before it leaves Monsanto's plant for yours. MONSANTO CHEMICAL COMPANY, St. Louis, U. S. A.

MONSANTO CHEMICALS
SERVING INDUSTRY...WHICH SERVES MANKIND

"E" for Excellence . . . the pennant denoting the highest service accomplishments in the United States Navy . . . flies with the Naval Ordnance flag over Monsanto. In the words of the Secretary of the Navy, this award has been made to Monsanto "in recognition of your outstanding efforts in the production of ordnance materiel vital to our national defense."

Program of the Memphis Meeting of the American Chemical Society

April 20 to 23, 1942

General Program

Sunday, April 19

2:00 to 9:00 P. M.—Registration, East Corridor, Municipal Auditorium, Main Street and Poplar Avenue.
8:30 to 10:30 P. M.—Social gathering with refreshments, Georgian Room, Hotel Peabody.

Monday, April 20

8:00 A. M. to 6:00 P. M.—Registration.
9:30 A. M.—Council meeting, Ballroom, Mezzanine Floor, Hotel Peabody (closed meeting, Councilors only).
2:00 P. M.—General meeting, South Hall, Municipal Auditorium.

The Honorable Walter Chandler, Mayor of Memphis, **Address of Welcome.**
Presentation of diplomas certifying 50 years of continuous AMERICAN CHEMICAL SOCIETY membership to: Leo H. Baekeland, G. E. Barton, Walker Bowman, Harold H. Fries, Walter Mills Saunders, Albert L. Smith, Alfred Springer, C. P. Van Gundy, Homer Jay Wheeler, and Fred G. Zinsser.
Presentation of the **Borden Award in the Chemistry of Milk** to **George E. Holm.** (Award address before the Division of Agricultural and Food Chemistry, Section B, Thursday, 2:15 P. M., Room K, Municipal Auditorium, see page 392.)
Presentation of the **Eli Lilly and Company Award in Biological Chemistry** to **Earl Allison Evans, Jr.** (Award address before the Division of Biological Chemistry, Wednesday, 11:10 A. M., Room K, Municipal Auditorium, see page 394.)
Henry G. Knight, U. S. Bureau of Agricultural Chemistry and Engineering, **"Cotton—Yesterday, Today, and Tomorrow".**
A. Gibson, Colonel, Chemical Warfare Service, Inspector, Office of Civilian Defense, **"The Chemist's Place in Civilian Defense".**
Lawrence W. Bass, Mellon Institute of Industrial Research, Chairman, A. C. S. Committee on Economic Status, **Report of the Committee.**
Motion Picture, "Fighting the Fire Bomb", Office of Civilian Defense Training Film.

6:30 P. M.—Group dinners.
8:15 P. M.—Vanderbilt University A Cappella Choir. Goodwin Institute Auditorium, Madison Avenue and Third Street. Admission by ticket (no charge) which must be obtained at registration headquarters.
9:30 P. M.—Smoker, Ballroom and Louis XVI Room, Hotel Peabody. Admission by badge.

Tuesday, April 21

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
2:00 P. M.—Plant trips.
6:30 P. M.—Group dinner.
7:00 P. M.—Pit Barbecue and Southern Melodies, North Hall, Municipal Auditorium. Admission by ticket (no charge) which must be obtained at registration headquarters before noon Tuesday.

The Port of Memphis and Riverside Drive

Wednesday, April 22

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
9:00 A. M. to 4:00 P. M.—Holly Springs Pilgrimage (see page 388).
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
2:00 P. M.—Plant trips.
5:00 P. M.—Social hours.
7:15 P. M.—Social period (refreshments) for dinner attendants, Louis XVI Room, Hotel Peabody.
7:45 P. M.—Subscription dinner, Ballroom, Hotel Peabody. Tickets, $3.00 each, must be secured at registration headquarters before 4:00 P. M. Limit, 600.
10:00 P. M.—Dance, Ballroom, Hotel Peabody. Admission by badge.

Thursday, April 23

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
12:15 P. M.—Group luncheons.
1:30 P. M.—Golf tournament (see page 386).
2:00 P. M.—Divisional meetings.
2:00 P. M.—Plant trips.
6:30 P. M.—Group dinner.

Local Committee Chairmen

Office, Municipal Auditorium, North Mezzanine

HONORARY CHAIRMAN. Victor A. Coulter.
GENERAL CHAIRMAN. William F. Bowld.
VICE CHAIRMAN AND TREASURER. E. R. Barrow.
  ASSISTANT TREASURER. G. L. Weaver.
  PRINTING AND SIGNS. T. L. Rettger.
  PUBLICITY AND PRESS. R. F. Gould.
  REGISTRATION. J. N. Pless.
VICE CHAIRMAN. P. D. Bowers.
  INFORMATION. J. M. Hart, Jr.
  LADIES ENTERTAINMENT. G. N. Ferguson and Mrs. K. H. Hicks.
  STUDENT CHEMISTS. G. H. Hayden.
  WOMEN CHEMISTS. Mrs. K. H. Hicks.
VICE CHAIRMAN. T. P. Nash, Jr.
  ENTERTAINMENT. E. E. Hembree.
  GOLF. J. R. Meadow.
  GROUP MEALS. E. F. Williams.
VICE CHAIRMAN. L. N. Rogers.
  ACCOMMODATIONS. E. R. Stevens[1].
  MEETING ROOMS. J. D. Atkinson, Jr., 849 Biggs St., Memphis.
  TRANSPORTATION AND TRIPS. C. B. Weiss.

[1] Request hotel reservations on form printed on page 390.

Announcements

All events are on Central War Time.

Locations of Meetings. Registration and most divisional meetings will be held in the Municipal Auditorium, Main Street at Poplar Avenue. A few sessions are scheduled for the Pepper Memorial Sunday School Building of the First Methodist Church, Second Street between Poplar and Exchange Avenues. The Tuesday afternoon program on the Effect of National Emergency on Research Administration will be held in the Hotel Peabody.

Registration and Registration Fee. The registration headquarters of the meeting will open at 2:00 P. M. Sunday in the Main Street (east) corridor of the Municipal Auditorium, and will continue there throughout the meeting. Registrants are requested to *use the Poplar Avenue entrance.* The registration fee, required by vote of the Council to help carry local expenses, has been fixed at $3.00 for members and visitors other than American nonmember chemists and chemical engineers; $8.00 for American nonmember chemists and chemical engineers. Associate members of divisions or of local sections are not members of the AMERICAN CHEMICAL SOCIETY and, if chemists or chemical engineers, are subject to the $8.00 fee. Chemical students, both graduate and undergraduate, are given the courtesy of registration on exactly the same basis as members of the SOCIETY. All members and guests must register to help carry the expense of the meeting.

Badges. It is important that official badges be worn at all times, as admission to all divisional meetings and to certain of the events on the entertainment program is by badge only.

Mail. Mail and telegrams should be sent to the hotel where stopping. Communications addressed in care of the AMERICAN CHEMICAL SOCIETY cannot be delivered to the individual but will be held at the A. C. S. Information Booth in the Municipal Auditorium. The SOCIETY accepts no responsibility for delivery of mail. After each national meeting, some mail and telegrams remain undelivered. Therefore, as a matter of precaution, convention attendants should inquire for mail at the A. C. S. Information Booth, regardless of their local address.

Transportation. Street cars, electric coaches, and busses link all official hotels and the Municipal Auditorium. Exact information regarding transportation to and from the loop district can be obtained from maps of downtown Memphis, available at the Information Booth in the Municipal Auditorium. Fare on street cars and busses is 7 cents to any point in the city. Taxi fare is 35 cents for the first 3 miles, 10 cents for each additional 0.5 mile. As many as five may ride in a taxi for the price of one.

Parking. Most of the hotels maintain parking lots for guests. Open-air lots charge from 15 to 25 cents for all-day parking; garage charges average 25 cents for all day and 50 cents for day and night parking. Parking on the streets in the downtown area is regulated by meters which operate from 8:00 A. M. to 6:00 P. M., with a charge of 5 cents for one hour. Do not insert more than one coin in the meter, as only one hour's parking time will be obtained. Additional coins must be deposited each hour. Meters are located from Washington to Beale Avenues on Front, Main, Second, and Third Streets; to Fourth Street going east on Court, Madison, Monroe, and Union Avenues; and to the foot of the levee going west on Court, Union, Monroe, and Jefferson Avenues. Park only in marked spaces. East of Third Street, except Madison Avenue, and west of Front Street, meters permit parking at a charge of 5 cents for two hours. At the Auditorium parking lot, southwest of the Municipal Auditorium, meters provide four-hour parking at a charge of 5 cents.

Information. An information booth will be maintained in the lobby of the Municipal Auditorium.

Tickets. Tickets for all events should be secured as far in advance as possible in order to permit the committee to make the proper arrangements.

Press. The AMERICAN CHEMICAL SOCIETY News Service will maintain press headquarters on the Mezzanine Floor of Hotel Peabody, Room 215.

Offices. North Mezzanine, Municipal Auditorium. AMERICAN CHEMICAL SOCIETY, National Secretary, Room G; *Industrial and Engineering Chemistry*, Room G; Local Committee, Room H.

Ladies Headquarters. Hotel Peabody, Mezzanine Floor, Room 200.

Women Chemists. Headquarters for women chemists will be maintained in the north end of West Hall, Municipal Auditorium. Women chemists from Memphis will be in attendance each day throughout the meeting from 9:00 A. M. to 5:00 P. M. to welcome visitors and register them for the files of the Women's Service Committee. A courtesy desk will be maintained to provide information and to make contacts desired by women chemists. A breakfast for members of Iota Sigma Pi will be held in the Blue Room of the Hotel Claridge at 7:30 A. M. Tuesday, April 21; tickets, $0.85 each. A luncheon for women chemists will be held in Room 209, Hotel Peabody at 12:15 P. M. on Tuesday, April 21; tickets, $1.25 each. Kathryn H. Hicks, Chairman, Women Chemists Committee, Memphis meeting, will be toastmistress. A Round Table from 4:30 to dinner time will be held on Tuesday, April 21, in the women chemists headquarters, West Hall, Municipal Auditorium. Tea will be served. Women chemists are invited to attend any or all of the events scheduled on the Ladies Program (see page 386).

Group of Divisional Officers. This group will meet for breakfast Thursday at 7:30 A. M. in Room 209, Hotel Peabody. Tickets, 85 cents, must be procured before 6:00 P. M. Wednesday. Charles R. Hoover, Chairman; Howard I. Cramer, Secretary.

Group of Local Section Officers. This group will meet for breakfast Tuesday at 7:30 A. M. in Room 209, Hotel Peabody. Tickets, 85 cents, must be procured before 6:00 P. M. Monday. F. O. Rice, Chairman; Auburn A. Ross, Secretary.

Abstracts. The A. C. S. News Service, 1155 Sixteenth St., N. W., Washington, D. C., can supply a limited number of sets of abstracts of papers presented at the Memphis meeting at 50 cents per set to those submitting receipt for divisional dues; $1.00, to others who remit with order; $1.25, to those who fail to send cash with order; and $1.50, to those requiring bills to be rendered. The abstracts will be as furnished by the authors and will be mailed as soon as possible. Copies will also be on sale at Memphis.

Equipment for Meeting Rooms. Divisional meeting rooms will be equipped with a standard lantern-slide projector, screen, pointer, blackboard, chalk, reading stand, reading light, table, and ice water. Each divisional secretary should contact his local assistant and inspect the assigned meeting room before the first session of the division. Please direct all correspondence concerning

TWO SUPER REFRACTORIES THAT OPERATE SAFELY AT 3200° AND 4000° F

TAM Zircon (Zirconium Silicate) refractories operate safely at temperatures over 3200° F. while TAM Zirconium Oxide refractories are used in applications over 4000° F.

These two TAM super refractories resist acids and oxidizing atmospheres. They are being successfully used in the manufacture of phosphates, fused silica, aluminum melting and platinum smelting. They are also widely used as crucible backing and for various high temperature applications.

An experienced staff of field engineers located in various parts of the country are available for consultations without obligation. Write:

TAM PRODUCTS INCLUDE

Zircon bricks, special shapes and crucibles . . . Zircon insulating refractories . . . Zircon ramming mixes, cements and grog . . . Zircon milled and granular . . . Electrically Fused Zirconium Oxide Refractories . . . Electrically Zirconium Oxide cements and ramming mixes . . . Electrically Fused Zirconium Oxide in various mesh sizes.

meeting rooms to J. D. Atkinson, Jr., 849 Biggs St., Memphis, Tenn.

Society Regulations Governing Registration

BYLAW 2 (*a*) Attendance at meetings of the SOCIETY is limited to registered persons

(*b*) All persons in registering at meetings of the SOCIETY shall state whether or not they are members of the SOCIETY and, if not, whether they are chemists or chemical engineers.

(*c*) American chemists or chemical engineers, nonmembers of the SOCIETY, attending meetings of the SOCIETY, shall assist in the support of the facilities which they enjoy by paying a higher registration fee than members This differential at general meetings shall be $5 00 higher than the fee charged members; while at regional and divisional meetings it shall be at least twice the regular fee adopted They shall be furnished with a special nonmember badge to differentiate them from members of the SOCIETY and from foreign and nonchemist guests. The differential charged shall not apply to regularly matriculated students majoring in chemistry or chemical engineering at any college or university.

(*d*) Meetings are normally open to all registrants, but any session may be closed to nonmembers of the SOCIETY by order of the President.

NOTE. Corporation members have the right to designate *one representative only* with membership privileges at each meeting. If a *corporation member* sends a substitute for the delegate of record, the Secretary's office should be informed by mail. In registering, such a representative should sign the corporation name, per his own as representative

Associate members of local sections and of divisions are not members of the Society and have no Society privileges All nonchemist visitors, including children, regardless of age, who participate in any trips, lunches, or other activities provided on either the men's or ladies program, regardless of whether they are free or paid events, must pay the visitors' registration fee, $3.00, and wear the appropriate badge.

Society Regulations Governing Papers

BYLAW 3. (*a*) Papers by American chemists or chemical engineers not members of the SOCIETY shall not appear on the programs of general, divisional, or regional meetings of the SOCIETY unless they be joint papers with SOCIETY members.

(*b*) All papers presented before general, divisional, regional, group, local section, or other meetings are the property of the SOCIETY, to be published in the journals of the SOCIETY or released by the appropriate editor if not retained for such publication.

NOTE. The editors will give prompt decisions when papers are sent to them with request for release. The editors concerned are A. B. Lamb, H. E. Howe, S C. Lind, N. W. Rakestraw, and W. Albert Noyes, Jr.

(*c*) The SOCIETY is not responsible for statements and opinions advanced by individuals in papers or discussions before its meetings.

(*d*) Any paper, although announced in the final program, may be excluded at any time prior to delivery by order of the President.

The Board of Directors has voted the following regulations (R-55) governing papers to be presented before general, divisional, regional, or group meetings, supplementing Bylaw 3:

(*a*) Authorship of papers shall be accredited only to individuals and not to companies or laboratories.

(*b*) No paper may be presented which has been offered for publication elsewhere.

(*c*) No paper, no matter how important, may be presented, the title of which does not appear on the final program.

(*d*) If a paper is declined by any division of the SOCIETY, the secretary of that division is instructed to notify the secretary of any other division to which it is likely to be offered.

Hotels

Hotel Peabody, Union Avenue between Second and Third Streets, has been designated as headquarters for the meeting.

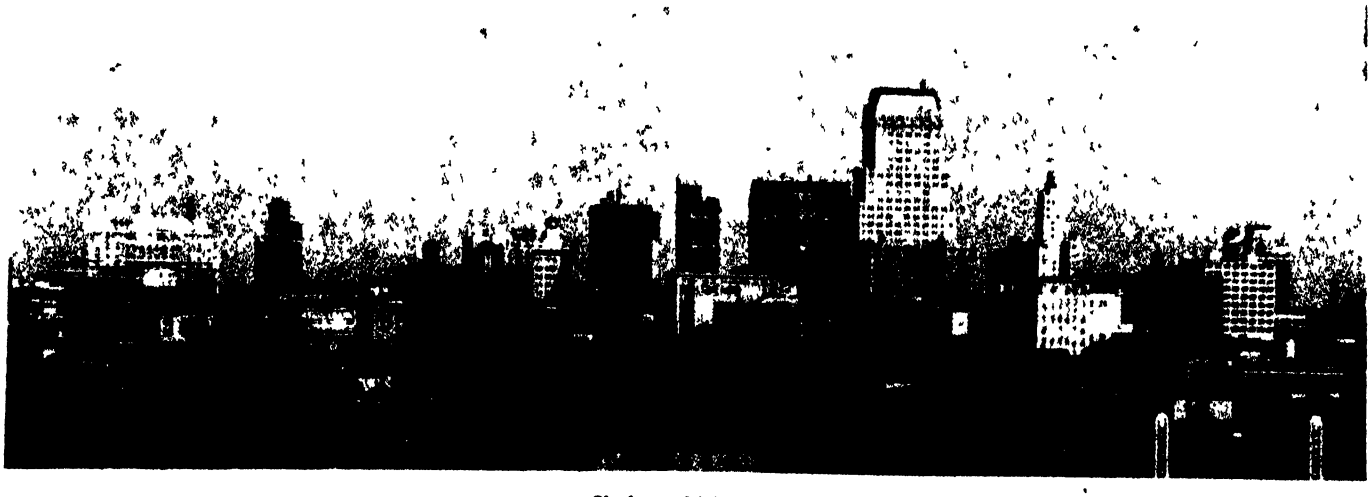
Requests for reservations should be sent at once to the A. C. S. Hotel Committee, Memphis Chamber of Commerce, Hotel Peabody, Memphis, Tenn. Please fill out the hotel reservation request form on page 390, giving all the data requested.

Because of the present large demand for hotel rooms in Memphis, it is imperative that reservations be made at the earliest possible date. For the same reason, double occupancy of rooms is desirable. Since defense activities are making a heavy call on Memphis hotels, the convenience of a single room should be sacrificed as a patriotic contribution. It is in this spirit that the Hotel Committee asks that: (1) hotel reservations be made early, giving the dates of arrival and departure, and (2) members arrange to share double rooms. See page 406 for map of downtown Memphis.

Rooms for students, dormitory style, will be available at $0.75 and up per day

Official Hotels

HOTEL	RATES		
	For One Person[a]	For Two Persons	Suites
Peabody	$3.00 to 6 00	$4 00 to 10 00	$14 00 to 25 00
Claridge	3 00 to 5 00	4 00 to 8 00	.....
Ambassador	2 25 to 3 00	2 25 to 3 00	.....
Blackstone	1 50 to 2 50	2 50 to 4 00	
Chisca	1 50 to 4 50	3 50 to 5 00	7 00
DeVoy	2 00 to 5 00	3 50 to 5 00	...
Gayoso	2 50 to 5 00	3 50 to 6 00	.
Wm Len	2 50 to 3 50	3 50 to 4 00	6 50



[a] Limited in number. Double occupancy is desirable.

Group Meals

Quoted prices include tips; any solicitation made at the tables should be refused. The deadlines for the purchase of tickets at registration headquarters in the Municipal Auditorium are as follows: Breakfasts, 6:00 P. M. of the preceding day; luncheons, 9.30 A. M.; dinners and social hours, 2:00 P. M. Meals will be ordered on the basis of sales before these times. In order to cover the cost of rearrangements, *a service charge of 15 cents will be added to the stated price for each meal if the ticket is not purchased before the deadline.* No refunds will be made on tickets after the deadline

The hotels reserve the right to transfer to special tables in their regular dining rooms any group meals for which fewer than 15 tickets have been sold at the deadline hour.

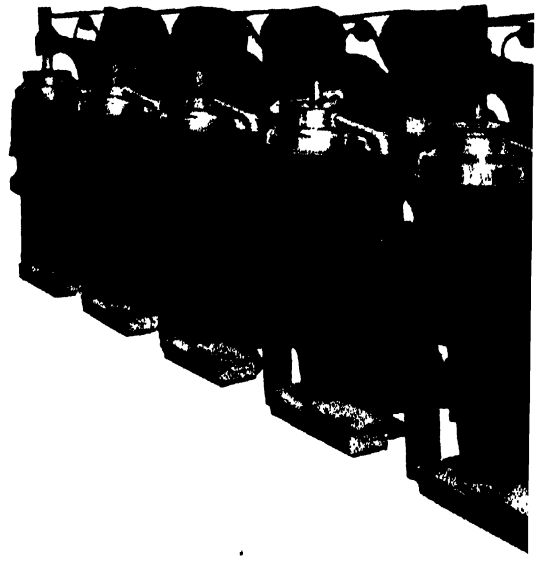
Skyline of Memphis



FIRST COUSIN

America needs guns and she needs all the available material to make those guns.

Above is illustrated a batch process involving thousands of pounds of iron and steel, housed by more structural material . . . all required where gravity settling is the procedure. Can this be justified today when continuous production can be rendered by the use of a few hundred pounds of material scientifically combined to form a centrifugal . . . when you can reduce process inventories to the amount of material which fills the pipe line to and from the machine . . . when you can make a better end product centrifugally in a fraction of the time?

Sharples Super-Centrifugal Force makes the above practicable and releases those valuable defense materials for other uses.

[a] Interested nonstudents invited.

[b] Tea, coffee, sandwiches, and cakes served. Sparkling water and ginger ale obtainable from private bar at standard prices.

Plant Trips

Inspection trips to plants have been greatly curtailed because of the war. Many industries cannot permit inspection trips and others must limit attendance in order to avoid interference with production. Many plants will require identification before passes will be issued. Please wear your A. C. S. badge, which will be considered as adequate identification.

Members and visitors should purchase tickets for inspection trips when registering. Tickets for morning trips will be withdrawn from sale at 5:00 P. M. the previous day and for afternoon trips at 9:00 A. M. the same day. If the limit for the trip has not been reached when tickets are withdrawn from sale in registration headquarters, they may be purchased at the time of departure for 15 cents more than the stated price.

Busses will leave the Poplar Avenue entrance of the Municipal Auditorium at the times indicated.

American Snuff Co.

Established in 1782, the American Snuff Co. has grown until it is one of the world's largest producers of snuff. The amount of snuff used yearly in the United States runs into surprisingly large figures. In the Memphis plant one can see all the various phases of manufacture from the aging of tobacco to the packing of the finished product. Of special interest to technical men are the moisture conditioning of the leaves, the careful roasting process, the dust-free grinding, and the screening of the fine tobacco powder. A tin can department is also operated which makes the containers used by the automatic filling machines.

Buckeye Cotton Oil Co.

Hollywood Plant. Huge industries have been built upon what was once a waste product of staple cotton. This former waste, the cottonseed, has taken its place among the important industrial raw materials of the Nation. The Hollywood plant is the largest cottonseed oil mill in the world. Here visitors will see the removal of first-cut linters for furniture stuffing, removal of second-cut linters for chemical cotton, and the salvaging of the remaining fuzz from hull fiber also to be used in chemical cotton processing. The seed meats are crushed, heated, and then squeezed by hydraulic presses to take out the oil that is used by the manufacturer of vegetable shortening. The remaining cake is utilized as cattle food.

Pulp Plant. The Memphis Pulp Plant is one of the three plants in the United States processing cotton linters. Here the lint from cottonseed (which was removed from the seed at the oil mill after the ginning process) is purified for any number of ultimate uses. In peacetime the Pulp Plant supplied its product for manufacture of such everyday essentials as acetate rayon, films, cellophane, plastics, floor covering, weiner casings, etc. In wartime the plant is doubly valuable as a basic industry for the manufacture of chemical cotton for smokeless powder.

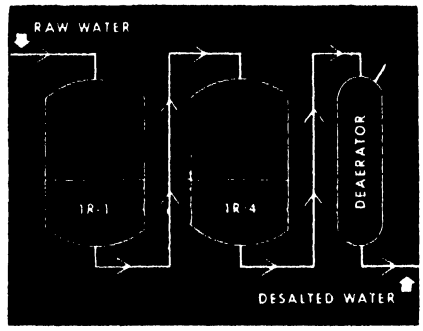
Pure Water



FOR INDUSTRY AT NEW LOW COST

AMBERLITE Ion Exchange Resins Improve the Older Methods of Purification

THE production of large amounts of very pure water is a constant problem in many industries. In many cases, a water equivalent to distilled in degree of purity is absolutely necessary, but, in other cases, although it has been proven that superior results would be obtained if such a water were used, cost has prohibited its use in such processes.

Distillation on a large scale is by no means trouble-free, and the use of plant condensates is often prevented due to presence of oil or iron therein. Now, for the first time, the development of the AMBERLITE Synthetic Ion Exchange Resins has made possible trouble-free production of very pure water at remarkably low cost. With exchange materials previously available it has been possible to remove soluble salts from water, but the physical and chemical properties of these earlier exchange materials were such that impurities were imparted to the effluent, and, due to low capacity, runs were short and much manipulation of the unit was necessary. Furthermore, the exchangers exhibited limited stability, and, in general, the difficulties which were encountered more than offset any economies possible by their use.

The AMBERLITE Ion Exchange Resins are outstanding from the standpoint of capacity and are unique in that the removal of ions is complete until break-through. That

is to say, there is no gradual increase in salt concentration in the effluent during operation. In addition, being true synthetic resins, they exhibit excellent physical and chemical stability under a wide variety of conditions.

Many Applications in Industry

The production of pure water in quantity at low cost is but one of the important services which the AMBERLITE Ion Exchange Resins render to industry. In a similar manner, the unique properties of the AMBERLITES make them useful in other water conditioning processes including softening of water, reduction of bicarbonate alkalinity, etc. The same unique properties make the AMBERLITES valuable in the recovery of copper, manganese, nickel and other valuable constituents from wastes. They also may be used to purify fine chemicals and dyestuffs, or to remove iron or other harmful ions from aqueous solutions.

For detailed information on these significant new resins, write today. The Resinous Products & Chemical Company is the only company licensed to produce these synthetic resins in the United States.

OTHER DEVELOPMENTS OF THE RESINOUS PRODUCTS LABORATORY

Synthetic Resins as Plywood Adhesives

TEGO—a reactive phenol formaldehyde resin in film form, is the standard plywood adhesive for airplanes, boats, and for other uses where maximum durability is essential.

UFORMITE—a urea formaldehyde resin adhesive widely used in place of the less durable animal and vegetable glues for plywood, furniture, etc.

Synthetic Resins in the Coatings Industry

More than fifteen years ago, AMBEROLS (modified oil-soluble phenol formaldehyde resins) paved the way for the modern, quick-drying varnishes. Since then, DURAPLEX alkyd resins, UFORMITE urea formaldehyde resins, and ACRYLOID polymers of acrylate and methacrylate esters have extended the use of synthetic resins in paints, varnishes, lacquers, printing inks, coated fabrics, and floor coverings.

Resin Emulsion Paints

Six years ago, work was begun on the development of alkyd resin emulsions as clear coatings, primers, and—in pigmented form—as paints. This emulsion, AQUAPLEX, is now in wide use as the base of an entirely new type of paint.

The Paraplex Family of Resins

The PARAPLEX resins are a unique class of the alkyd-type resins. They are tough, rubbery products of varying degrees of softness and are outstanding resin plasticizers for nitro-cellulose and ethyl-cellulose. Special forms are adapted for use in caulking and sealing compounds and in the modification of synthetic rubber.

Versatile Urea Formaldehyde Resins

UREA formaldehyde resins are proving to be the most versatile of the synthetic resin types. Produced as dry water-soluble powders, as aqueous solutions, as modifications soluble in ethyl alcohol and butyl alcohol, octyl alcohol and hydrocarbons, these resins are finding a widening use as plywood adhesives, in the treatment of textiles and paper and in baking finishes for wood and metal.

Complete Technical Advisory Service

Upon request, interested chemists will promptly receive technical literature on any of our products. In addition, a member of the Resinous Products' trained technical staff will consult with chemists on proposed applications of any of our products. This service, which includes the facilities of the Resinous Products Laboratory, is offered without obligation. Write today, stating what cooperation you would like us to render.

THE RESINOUS PRODUCTS & CHEMICAL COMPANY

WASHINGTON SQUARE, PHILADELPHIA, PA.

Forest Products Chemical Co.

Visitors to the plant of the Forest Products Chemical Co. will see one of the few wood distilling plants operating today. Synthetic processes for production of acetic acid and methyl alcohol have replaced many wood-distillation installations. By the use of modern developments, such as the Suida process of vapor-phase extraction and azeotropic distillation with ethyl acetate, the plant to be visited has been able to compete successfully.

This company was the first to sack and distribute charcoal for domestic use in the South.

Layne and Bowler, Inc.

Layne and Bowler, Inc., of Memphis, Tenn., manufactures the vertical centrifugal pump used largely for ground water supply and commonly known as the deep-well turbine pump. All operations from raw materials to finished pump are performed in this plant. It includes a pattern shop, foundry, and machine shop, and a testing laboratory. The pattern and core work involved in the castings is of interest both because of its intricacy and the close control necessary for consistent performance of the finished pumps. The extremely limited space available for the deep-well turbine pump, as compared with that for its horizontal brother on the surface, introduces sensitive problems in design and manufacture. Sizes regularly manufactured vary from one which can be placed in a 4-inch pipe to the largest, which fits into a 24-inch pipe. All pumps are tested in a laboratory using accurate methods of measuring power, speed, head, and flow.

McCallum and Robinson

Fire, water, and dirt keep this 15-acre, 28-year-old industry supplied with its raw material—damaged cotton. Here what otherwise would be a complete loss to the South is reconditioned and made into a variety of products such as blankets, mops, and rugs. The complete manufacture of a Romac rug is accomplished in 30 seconds.

Memphis Packing Co.

Farm diversification programs in recent years have pushed Memphis more and more into the packing industry. At the present time, the Memphis Packing Co. is the largest in the Mid-South and is equipped throughout with the most modern facilities. Visitors can see the preparation of cattle, swine, and sheep carcasses from the initial slaughtering to the final shipping to markets.

Municipal Filtration Plant

Although the Mississippi River has done and will continue to do much for Memphis, it is completely ignored as a source of municipal water. Instead, wells tap one of the purest underground streams found in the United States. The large-scale treatment of this well water by modern methods will be seen and explained.

Southern Shellac Manufacturing Co.

The Southern Shellac Manufacturing Co. is the only importer and bleacher of shellac in the South. It is also the only shellac manufacturer in the country that produces bleached shellac in a continuous process. This has been possible through the building and installation of a unique modification of the flash drying system for drying heat-sensitive products.

University of Tennessee, School of Biological Sciences

The University of Tennessee, with the cooperation of the Tennessee Valley Authority and the National Research Council, is carrying on an extensive program of malaria research. Members of the AMERICAN CHEMICAL SOCIETY are invited to inspect an exhibit representative of this project, which will be located in the Hotel Peabody, and to visit the Memphis laboratories of the university. A kodachrome moving picture of the intravascular changes produced in living tissues by malaria will be shown. Following this the group will be divided into smaller sections for personally conducted inspections of the mosquito insectary, monkey house, duck room, chemical laboratories, immunological laboratory, and the library.

Golf Tournament

The AMERICAN CHEMICAL SOCIETY Golf Tournament will be held Thursday, April 23, at the Chickasaw Golf Club, about 7 miles from downtown Memphis. Play will begin about 1:30 P. M. and the winner will receive the Wilson Cup for low gross score. Many other prizes will be awarded, including Defense Bonds and Stamps contributed by Memphis business firms and hotels. *Participation in the tournament will be restricted to members of the Society.*

Transportation will be by taxicab starting from the Municipal Auditorium, the Hotel Peabody, and the Hotel Claridge at 12:30 P. M. Round-trip tickets, $1.00 each, may be secured at registration headquarters until noon Thursday.

Luncheon will be available at the Club House at reasonable prices. The tournament greens fee will be $1.00. Save up your golf balls for this event!

The course will be open all week to registrants at the meeting. The greens fee will be $1.00 per day.

Students

Students of chemistry and chemical engineering are urged to attend the Memphis meeting. As usual there will be many unexcelled opportunities for informal contacts with chemists and chemical engineers. Papers covering a wide range of subjects will be presented at the technical sessions. Your field of interest is certain to be touched. Plant trips and entertainments will be added attractions.

The entire Wednesday program of the Division of Chemical Education will be provided by students. It will start with a special breakfast in the East Lounge of the Chisca Hotel at 7:30 A. M. Tickets, price $0.50 each, must be obtained before 6:00 P. M. Tuesday. This is a splendid opportunity to meet students of chemistry and chemical engineering from all parts of the United States, as well as outstanding members of the profession who will be present. The technical sessions of the division on Wednesday will be turned over to the students. Sixteen papers will be given by 19 student representatives of 9 colleges and universities in 8 states.

One of the features of the meetings of the AMERICAN CHEMICAL SOCIETY for students and chemists looking for positions is the Employment Clearing House. Members and paid student affiliates of the SOCIETY registered at the meeting are eligible to avail themselves of this opportunity to contact employers. West Hall, Municipal Auditorium, has been set aside for this purpose (see page 390 for further particulars).

The registration fee for regularly matriculated students of chemistry and chemical engineering is $3.00. The cost of living accommodations in Memphis is reasonable. Rooms at $0.75 per day per person may be reserved by writing the A. C. S. Hotel Committee, Memphis Chamber of Commerce, Hotel Peabody, Memphis, Tenn. Be sure to use the hotel reservation request form, page 390, for this purpose. Write immediately before these accommodations are all reserved.

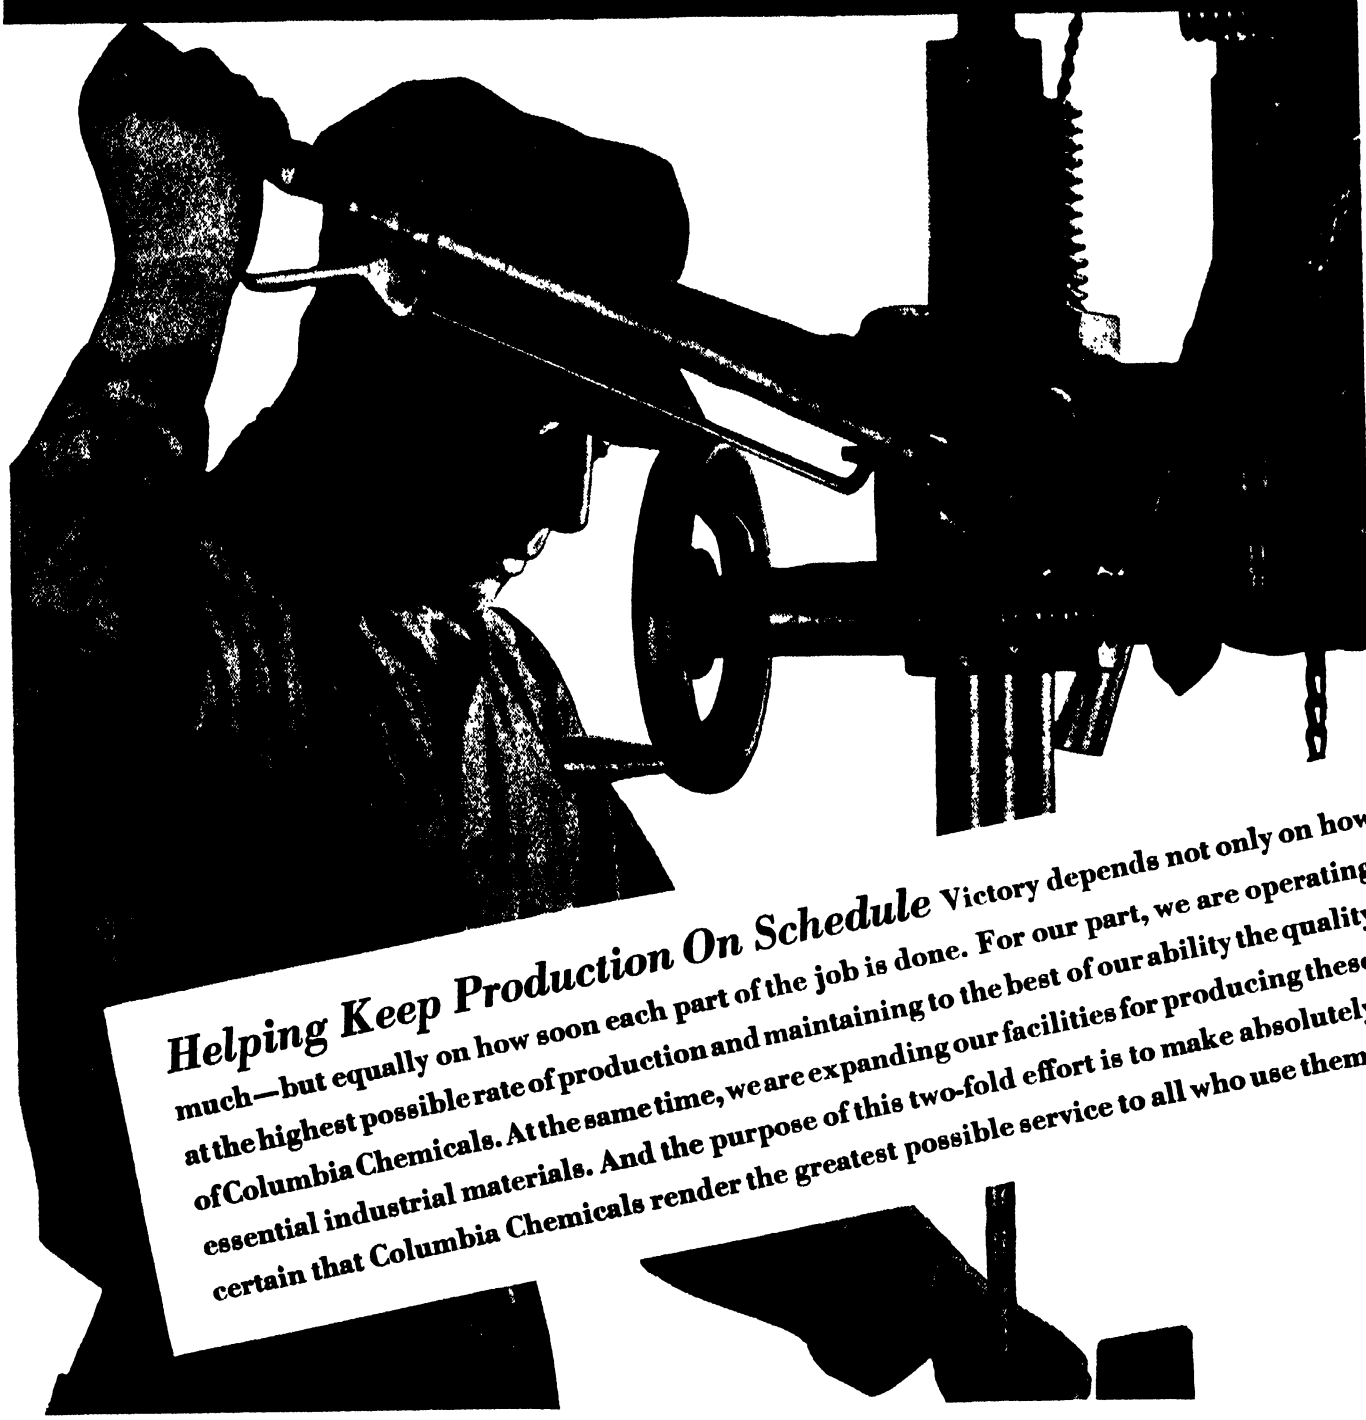
Ladies Program

Headquarters, Room 200, Mezzanine Floor, Hotel Peabody.
Men are invited to take any of the tours listed on this program.
Admission to each event is by ticket.

Sunday, April 19

2:00 to 9:00 P. M.—Registration, East Corridor, Municipal Auditorium, Main Street and Poplar Avenue.
2:00 to 5:00 P. M.—Ladies headquarters, Hotel Peabody, will be open to welcome visitors.
8:30 to 10:30 P. M.—Social gathering with refreshments, Georgian Room, Hotel Peabody.

Monday, April 20



8:00 A. M. to 6:00 P. M.—Registration, East Corridor, Municipal Auditorium.
2:00 P. M.—General meeting (see page 379).
3:00 to 5:00 P. M.—Tea and reception in honor of the wives of the officers of the AMERICAN CHEMICAL SOCIETY, Louis XVI Room, Mezzanine Floor, Hotel Peabody. Admission by ticket (no charge) which must be obtained at ticket booth in registration headquarters before 12:00 noon, Monday. All registrants at the meeting are invited to attend.
8:15 P. M.—Vanderbilt University A Cappella Choir. Goodwin Institute Auditorium, Madison Avenue and Third Street. Admission by ticket (no charge) which must be obtained at registration headquarters.
9:30 P. M.—Smoker, Ballroom and Louis XVI Room, Hotel Peabody. Admission by badge.

Tuesday, April 21

10:00 A. M. to 4:00 P. M.—Tour of city, including Magevney Home, Riverside Drive, DeSoto Park, and Romac Rug Co. Luncheon

CONTINUED ON PAGE 388

COLUMBIA CHEMICALS

Helping Keep Production On Schedule **Victory depends not only on how much—but equally on how soon each part of the job is done. For our part, we are operating at the highest possible rate of production and maintaining to the best of our ability the quality of Columbia Chemicals. At the same time, we are expanding our facilities for producing these essential industrial materials. And the purpose of this two-fold effort is to make absolutely certain that Columbia Chemicals render the greatest possible service to all who use them.**

ESSENTIAL INDUSTRIAL CHEMICALS

SODA ASH • CAUSTIC SODA • SODIUM BICARBONATE • LIQUID CHLORINE • SILENE* CALCIUM CHLORIDE • SODA BRIQUETTES MODIFIED SODAS • CAUSTIC ASH • PHOSFLAKE CALCENE** • CALCIUM HYPOCHLORITE

*Precipitated Calcium Silicate **Precipitated Calcium Carbonate

will be served at the Memphis Country Club at 12:00 noon. At 1:00 P. M. the tour will be resumed. The Memphis Museum (Pink Palace), Overton Park, and Brooks Memorial Art Gallery will be seen. At the latter, there will be a special showing of southern pottery and Van Gogh art followed by tea. Busses leave the Hotel Peabody. Tickets for all-day tour, including luncheon and tea, $2.25 each, must be obtained at registration headquarters before 5:00 P. M. Monday.

11:30 A. M. to 4:00 P. M.—Luncheon and sightseeing. For those not desiring to take the morning tour, busses will leave Hotel Peabody at 11:30 A. M. and proceed to the Memphis Country Club for luncheon. Beginning at 1:00 P. M., points of interest will be visited as listed above. Tickets for afternoon tour, including luncheon and tea, $1.90 each, must be obtained at registration headquarters before 5:00 P. M. Monday.

7:00 P. M.—Pit Barbecue and Southern Melodies, North Hall, Municipal Auditorium. Admission by ticket (no charge) which must be obtained at registration headquarters before noon, Tuesday.

Wednesday, April 22

9:00 A. M. to 4:00 P. M.—All-day trip to Holly Springs, Miss. Participants will visit famous old southern homes and gardens (see below). Busses leave from Hotel Peabody. All interested registrants at the meeting, both men and women, are invited to take this trip. Tickets must be obtained at registration headquarters not later than 4:00 P. M. Tuesday, price $3.50 each, including transportation, luncheon, and pilgrimage fee.

7:15 P. M.—Social period (refreshments) for dinner attendants, Louis XVI Room, Hotel Peabody.

7:45 P. M.—Subscription dinner, Ballroom, Hotel Peabody. Tickets, $3.00 each, must be secured at registration headquarters before 4:00 P. M. Limit, 600.

10:00 P. M.—Dance, Ballroom, Hotel Peabody. Admission by badge.

Thursday, April 23

10:00 A. M. to 12:30 P. M.—Visit to Memphis gardens. Busses leave from Hotel Peabody. The entire garden fee of $1.00 will be given to the American Red Cross. Tickets, $1.30 each, must be obtained at registration headquarters before 5:00 P. M. Wednesday.

2:00 P. M.—Busses leave Hotel Peabody for visit to Buckeye Cotton Oil Co., where cotton ginning and other operations will be shown. Tickets, 30 cents each, must be obtained at registration headquarters before 9:00 A. M.

Holly Springs Pilgrimage

Holly Springs, Miss., abounding with the glamor of the Old South, today stands as a landmark to the culture and refinement engendered by the early settlers. Opened to settlement by the Chickasaw Session of October 22, 1832, Holly Springs has, from the first, enjoyed a glorious prosperity. Great Georgian mansions, filled with the luxuries of life, made their appearance in the '40s and '50s. Many of these old houses have been preserved with their original furnishings and treasures still in possession of the builders descendants.

The Memphis committee has arranged a trip to Holly Springs on Wednesday, April 22. Included among the homes opened for the occasion are some quite famous houses. Airliewood, built by William Henry Coxe in 1859, was used as General U. S. Grant's headquarters in 1862. In the same year during federal occupation, Mrs. Grant made her home in the Walter Place, built by Col. Harvey W. Walter, noted lawyer and public-spirited citizen. Cedarhurst was the home of Sherwood Bonner, gifted writer of southern dialect stories. Gray Gables, built in 1832, is characterized by a spiral staircase, hand-carved woodwork, lofty ceilings, and fine stained glass. The Strickland Place, more than 100 years old, is noted as the first two-storied house built in Marshall County. The Featherston Place, built in 1834, was the home of the brilliant statesman, General Winfield Scott Featherston. It has the English basement characteristic of that period. The McCarroll House has been owned and occupied by five generations of the same family for more than 100 years.

Although arranged as part of the ladies program, men may participate in this pilgrimage. Tickets must be obtained at the ticket booth in registration headquarters not later than 4:00 P. M. Tuesday, price $3.50 each, including transportation, luncheon, and pilgrimage fee.

The Memphis Museum (Pink Palace)

The Memphis Museum is located in the heart of beautiful Chickasaw Gardens in the eastern part of the city. From the entrance on the south a large park extends to Central Avenue; on the north the land slopes to a picturesque lake. The pink Georgia marble building is framed by trees and shrubs. Visitors approaching the museum by any of the excellent highways can see its stately walls from a distance, since it stands on one of the highest points of land in the vicinity. The unfinished building and grounds were acquired by the City of Memphis in 1926, the original contract referring to "a large and costly mansion known as the Pink Palace". The exhibits shown in the museum include birds, fossils, marine life, minerals, cotton, lumber, china, glass, art, Indians, weapons, and aviation.

DeSoto Park

No city is richer in the historic traditions of North America than Memphis. Long before the well-known historic events at Jamestown or Plymouth Rock, came the expedition of Hernando De Soto, whose Spanish cavaliers were the first white men to set foot on the Chickasaw Bluffs. Four centuries after the dawn of history on the Chickasaw Bluffs, DeSoto Park enshrines memories which revive the long pageant of the American empire on its westward march. Not the silence of the wilderness but the clamor of a city enfolds the green square today. Yet, in the reminiscent mood of some sunny hour, it is easy to imagine, in the rustle of a tree, a sentry's whisper, or in a sudden sound, the crack of a long-stilled musket; easy, indeed, to glimpse a crude block house nearby, its log walls dissolving into a vision of the caballeros and their weary steeds who fade in turn, leaving the lonely sentinel, the red man who, as he disappears at last from the western horizon, leaves behind the word that has outlived the proud banners of Castile, the silver lilies of France, and the vain boasts of the conquerors—MISSISSIPPI—"the great river".

Brooks Memorial Art Gallery

The Brooks Memorial Art Gallery was given to the citizens of Memphis in 1916 by Mrs. Bessie Vance Brooks in memory of her husband, Samuel Hamilton Brooks. Built in a classical style of Georgian marble, it is situated in Overton Park on a site donated by the Memphis Park Commission. A small but very fine collection of paintings is on permanent display and loan exhibitions of fine and applied art are changed monthly. An Art Reference Library was started three years ago through the efforts of interested friends

tributed by gallery patrons, are on file. Twelve thousand reproductions of paintings, architecture, sculpture, furniture, ceramics, etc., are used extensively by the art teachers and students of the city and by clubs of Memphis and the Mid-South. During convention week, Brooks Memorial Art Gallery will exhibit famous old southern pottery and a collection of Van Gogh art.

Employment Clearing House

West Hall, Municipal Auditorium

At Memphis the SOCIETY will again provide facilities to bring together employers looking for chemists and chemical engineers and *members and paid student affiliates registered at the meeting*, seeking employment and wishing to make such contacts.

Beginning Sunday afternoon, candidates for employment will file records in the Clearing House on forms which provide space for a photograph, personal data, and information regarding education and experience. The records are maintained in classified files and are indexed under all fields of training and experience. This enables an employer to find quickly the records of those with the qualifications desired.

Beginning Monday morning, appointments for interviews will be made at the request of employers and at the times they specify. Private booths will be available for such conferences. No chemist or chemical engineer looking for employment and no employer looking for trained men can afford to miss this opportunity. Many personnel representatives attend each meeting solely to take advantage of the service.

Candidates for Employment

By action of the Board of Directors (December 12, 1940), the Employment Clearing House is open only to members and paid student affiliates of the AMERICAN CHEMICAL SOCIETY registered at the meeting.

The Clearing House will be open to candidates for employment at 2 P. M. Sunday, April 19. Since employers begin inspecting the vitae on Monday, most effective use is made of the records of those who arrive early in the week. At the most recent Clearing House, a larger proportion of interviews and offers of employment were received by those who registered during the first two days. Records filed in advance cannot be inspected by employers until after the arrival of the registrants, since all users are assured that everyone whose vita is on file is available for interview. Those who have not filed vitae by mail may fill out the forms in the Clearing House after arrival.

Amplification of the data on the forms and lists of publications cannot be accepted for filing in the Clearing House. Many employers decline to interview an individual whose photograph is not on his record; therefore, each person should bring with him two copies of a *good* picture (look pleasant; avoid flashlight photographs), not larger than 2.5 × 3 inches, and attach them to duplicate copies of his vita.

A representative of the United States Civil Service Commission will be in the Employment Clearing House to interview any persons interested in government employment. He will furnish information and will authorize appointments to positions at the proper

Employers

By action of the Board of Directors (December 6, 1941), the Employment Clearing House is not open to any employer or employer's representative "who, in offers made as a result of interviews in the Clearing House, is unwilling to meet the recommendations unanimously adopted at the Atlantic City meeting of the AMERICAN CHEMICAL SOCIETY in its resolution on employer-employee relationships". (See NEWS EDITION, December 25, 1941, page 1442.)

Although employment of chemists and chemical engineers is at a high level owing to the demands of rapidly expanding industry, it is expected that employers will find in the Memphis Clearing House registrants whose availability might not otherwise be known. They will be chiefly of two types: June graduates of small Mid-Western colleges not scouted by industry and those individuals seeking a change of employment, especially chemists and chemical engineers in nonessential industries wishing to make new connections in order to contribute directly to the defense program. Many employers expected a small Clearing House registration at the past two meetings. Actually 324 were available for interview in Atlantic City and 527 in St. Louis. At each of these meetings more than 1,000 interviews were arranged.

Employers who have never visited an A. C. S. Employment Clearing House will find this unique employment aid of distinct value. Many personnel department representatives attend each meeting solely to take advantage of this service. The number of employers regularly using the A. C. S. Employment Clearing House at national meetings of the SOCIETY indicates that the activity is meeting a real need.

The forms filed by candidates for employment provide space for a photograph, personal data, and information regarding education and experience. A classified index will be maintained so that one can find quickly those with the special training or experience desired. A private room will be available in which employers' representatives may inspect the index and vitae at any time from Monday through Thursday. At the request of the employer, interviews will be arranged promptly with any whose records are on file. The space available in Memphis again will permit erection of private interview booths.

We know of no other place at which one can find not only the records of such a diversified group of chemists and chemical engineers, but the individuals themselves. Any employer, having a vacancy to fill or anticipating one, can ill afford to pass up this opportunity to make personal contacts.

The advantages to employers are many. They may inspect these records without any of the registrants knowing they are looking for chemists. Personal interviews are always more satisfactory than correspondence; this plan makes available to each employer individuals from widely scattered localities who otherwise could be interviewed only through time-consuming and costly travel.

Plan on using the A. C. S. Employment Clearing House in West Hall, Municipal Auditorium, Memphis, April 20 to 23, 1942.

VITAMINS AND DEFENSE

IN all wars since history began disease has been the cause of more casualties, both military and civilian, than the weapons of the enemy. During the last World War it began to be recognized that some of these diseases, such as scurvy, were caused by a definite deficiency of some essential ingredient in the diet while others probably spread because of lowered resistance of the population due to this and other dietary lacks. Because of their relationship to life, these essentials were termed vitamins. Since practically nothing was known about them at the time, little could be done toward correcting these deficiencies.

Since then science has made tremendous strides in the chemistry of vitamins. The structure of most of those isolated has been determined and methods for synthesizing many of them developed.

The nations of the world have not been slow to recognize the importance of the vitamins. In her rearmament program Germany included factories for their production along with those for manufacturing guns, explosives and other munitions of war. One important ingredient in the emergency ration of the German parachute troops has been tablets of synthetic Ascorbic Acid (vitamin C). Our own Government has also recognized the importance of this vitamin and has included a product containing synthetic Ascorbic Acid in the ration of those now training for defense of our nation both on land and sea.

The United States and the British Empire have also included the maintenance of civilian health and morale in their defense plans. Enriched flours and breads, to which a number of the vitamins together with certain minerals have been added, have received official sanction. This development has been hampered by an insufficient supply of one of the vitamin ingredients — Riboflavin (vitamin B_2).

Chas. Pfizer & Co., Inc. have been glad to assist in the Defense Program. We have been one of the largest producers of Ascorbic Acid (vitamin C) for several years. There has been a continual increase in our production of this synthetic vitamin and plans are now in the process of consummation which will still further enlarge our productive facilities.

After a research program of several years, the production of Riboflavin (vitamin B_2) was started by our Company in 1940. At the present time we are bending every effort toward a great increase in the size of our productive facilities in order to assist in supplying the large quantities of this essential vitamin which are needed.

HE WOULD HAVE BURNED FOR THIS DISCOVERY!

WITH none but his cat to watch him, the alchemist in the Middle Ages worked at peril of his life, exploring the secrets of nature.

He was the father of modern chemistry. His quest was the "Philosopher's Stone"—a magic substance to change common metals into gold. But had he discovered wonders to compare with the miracles wrought by the modern chemical known as "Cumar"*... he would have been burned at the stake for trafficking with the devil.

For Cumar—a paracoumarone-indene resin developed by Barrett and put to use by progressive chemists and chemical engineers—has given amazing new qualities to hundreds of everyday articles from mastic floor tiling to rubber tires.

On rubber, Cumar confers new life and stretchability. And unlike many compounding agents, it blends equally well with natural or synthetic rubber—a characteristic of special significance today.

* * * *

This modern "Philosopher's Stone" is just one of a long list of coal-tar chemicals that have established Barrett's reputation for uniform, dependable products.

Perhaps you have a product that can be improved, a production schedule that can be shortened, or manufacturing costs that can be pared through the use of a coal-tar chemical. We invite you to drop a line to our experienced Technical Service Bureau, outlining your problem.

4:15—28. W. A. WISANSKY AND S. ANSBACHER. Studies on Tyrosinase Chemistry with *p*-Aminobenzoic Acid.
4:30—29. JOHN C. WIRTH AND F. F. NORD. Progress in the Study of Alcoholic Fermentation of Carbohydrates through Fusaria.
4:50—30. O. WINTERSTEINER AND J. D. DUTCHER. Crystalline Curarine from *Chondodendron tomentosum*.

Division of Cellulose Chemistry

E. E. HARRIS, *Chairman;* C. R. FORDYCE, *Secretary*
J. DUDLEY ATKINSON, JR., *Local Assistant*

Thursday Morning and Afternoon

Auditorium, Room D

9:30— 1. ARTHUR F. MARTIN. A New Correlation of Viscosity and Concentration for High Molecular Weight Compounds.
10:00— 2. GLENN A. GREATHOUSE, DOROTHEA KLEMME, AND H. D. BARKER. Evaluation of Methods for Testing Cellulose Deterioration by Fungi.
10:25— 3. ERNEST ANDERSON, R. L. MALAN, DONALD SCOTT, AND JOHN E. PICKERING. The Composition of Hemicelluloses. I. Hemicelluloses from the Leaves and Rinds of Corn Stalks, *Zea Mays*. II. Hemicelluloses from Rice Hulls, *Oriza Sativa*.
10:50— Intermission.
11:00— 4. EARL E. BERKLEY. Structure of Cotton Fibers as Revealed by the Electron Microscope.
11:15— 5. EARL E. BERKLEY, I. W. BAILEY, AND O. C. WOODYARD. Cell Contour and Cellulose Orientation as Shown by Microscopic and X-Ray Techniques.

12:15— Divisional luncheon, Hotel Gayoso, Ballroom, $1.15.

2:30— 6. E. P. SAMSEL AND J. A. MCHARD. The Determination of Alkoxyl Groups in Cellulose Ethers.
2:50— 7. THOMAS S. GARDNER AND C. B. PURVES. Distribution of Acetyl Groups in a Technical Acetone-Soluble Cellulose Acetate.
3:15— 8. H. A. RUTHERFORD, F. W. MINOR, A. R. MARTIN, AND MILTON HARRIS. Oxidation of Cellulose. The Reaction of Cellulose with Periodic Acid.
3:40— 9. G. GOLDFINGER AND H. MARK. Alkaline Purification of Cellulose.

CONTINUED ON PAGE 396

SUBSTITUTES

• JAPAN WAX

Many manufacturers have found that Nipocer N, a synthetic wax manufactured from freely available domestic raw materials, can replace Japan Wax.

Nipocer N is a light colored wax with a melting range of 41° C.–47° C. It blends with most waxes and resins and is easily emulsified with the usual emulsifying agents. Nipocer N is superior to Japan Wax in that it is less subject to oxidation and rancidification and is always uniform. It is being used in textile preparations, lubricants of various types, protective coatings, impregnants, polishes, and for most purposes where a wax with the properties of Japan Wax is desirable.

• GUM TRAGACANTH RIBBON

A shortage of high grade Gum Tragacanth Ribbon has caused users to seek substitutes. Gomagel gives viscosity and body in water similar to that of Gum Tragacanth Ribbon.

Gomagel is a pure white, edible, modified protein powder, made from freely available domestic raw materials. Its use is indicated in pharmaceuticals, tooth pastes, cosmetics, textile finishes, polishes and for all purposes where the bodying of aqueous solutions is a desirable factor.

• SAPONIN

A new foaming agent called Foamapin Liquid for technical purposes, produced from freely available natural raw materials, can replace Saponin.

Foam produced by Foamapin Liquid is strong and durable. The addition of small percentages of wetting agents gives greatly increased surface tension reducing properties; and gives a foam superior to most grades of Saponin. Foamapin Liquid is compatible with latex, dextrin, algin and starch. Foamapin Liquid is soluble in water in all proportions, and such solutions are stable. There is no decomposition on evaporation of the water.

HUNDREDS OF ANSWERS

Hundreds of chemists have found the answers to tough problems by consulting our catalogue — Chemicals by Glyco. It may give you the answer to your chemical problem and offer suggestions for substitutes. If you are interested in the cosmetic field the Glyco Cosmetic Manual is especially designed to meet answers in that field.

Every user of chemicals should have these catalogues for constant reference. You may need it tomorrow -- so send for your copy today.

Further information about the above products, samples, etc., can be obtained by writing the manufacturers, the Glyco Products Co., Inc.

GLYCO PRODUCTS CO., Inc.

230 KING STREET (Dept. 43) BROOKLYN, N. Y.

Division of Chemical Education

F. E. BROWN, *Chairman;* P. H. FALL, *Secretary*
G. H. WOLLETT, *Local Assistant*

Auditorium, Room D

Tuesday Morning

F. E. BROWN, *Presiding*

9:00— 1. ED. F. DEGERING, W. A. ALLEN, C. BORDENCA, L. A. GILLETTE, AND K. SCHAAF. Relative Electronegativity. VIII. Addition at the Olefin Bond.
9:20— 2. L. P. BIEFELD AND MARGARET GRIFFING. Color Nomenclature in Qualitative Analysis. I. The Intersociety Color Council Nomenclature.
9:35— 3. L. P. BIEFELD AND MARGARET GRIFFING. Color Nomenclature in Qualitative Analysis. II. ISCC-NBS Color Names.
9:50— 4. E. C. HERMANN AND JACOB R. MEADOW. Ethylene Mercaptan and Its Reaction with Aldehydes and Ketones.
10:05— 5. N. D. CHERONIS. The Use of Semimicrotechnique in Elementary Organic Chemistry. III.
10:25— 6. J. A. BURROWS, PAUL ARTHUR, AND O. M. SMITH. The Use of Semimicrotechnique in Teaching General Chemistry Laboratory.
10:35— 7. D. G. NICHOLSON. When High School Teachers Take College Freshman Examinations!
10:50— 8. MAY L. WHITSITT. Some Additional Factors to Consider in the Training of Undergraduate Students Majoring in Chemistry.
11:05— 9. F. B. DUTTON AND DALE DREISBACH. The Use of Standardized Tests in the Teaching of General Chemistry at Baldwin-Wallace College.
11:25—10. P. R. FEHLANDT. Vitalizing the Teaching of General Chemistry.
11:40—11. J. A. BURROWS. The Cost of Installing and Maintaining a Chemistry Laboratory in a Small Secondary School Using Homemade and Semimicroequipment.

Tuesday Afternoon

ROUND TABLE ON THE PROBLEM OF TEACHING CHEMISTRY

H. N. ALYEA, *Presiding*

2:00—12. T. A. ASHFORD. The Problem of Chemistry in General Education.
2:20—13. J. A. BABOR. Subject Matter Common to All Courses in General Chemistry, and the Sequence of the Topics.
2:40—14. J. E. CAVELTI. The Perennial Problem of Course Content in a Growing Science.
3:00—15. C. S. ADAMS. The Importance of Laboratory Work in General Chemistry at the College Level.
3:20—16. B. C. HENDRICKS. The Varied Objectives Implied in Service Courses in General Chemistry.
3:40—17. F. D. MARTIN. A Diagnostic and Remedial Study of Failures in Freshman Chemistry.
4:00— General discussion led by W. C. FERNELIUS and W. C. JOHNSON.
5:00— Meeting of Executive Committee.

Wednesday Morning and Afternoon

STUDENT PROGRAM

7:30— Student breakfast, Chisca Hotel, East Lounge, 50 cents. Attendance not limited to students; any interested persons welcome.

G. H. HAYDEN, *Presiding*

9:15—18. C. J. WEBSTER. Robert Peter—Practical Educator.
9:30—19. B. A. THOMAS, JR. Robert Peter as an Agricultural Chemist.
9:45—20. NASH COLLIER, JR. Benefits of Undergraduate Research. Description of a Problem.
10:00—21. MARY RITA STOVALL, NORITA THIBODEAUX, AND SISTER MARY ADELINE. A Study of the Sugars in the Fruit of Bittersweet.
10:15—22. B. A. SMITH. Colloidal Selenium.
10:30—23. NANCY BROWER. Copper from Chile.
10:45—24. ALICE KUEBEL. A Preparation and Some Properties of Ammonium Diuranate
11:00—25. J. S. BURCH. The Cracking of Heavy Hydrocarbons.
11:15—26. HULIT MADINGER. The Production of 100-Octane Fuels by Alkylation.
11:30—27. MARY A. SULLIVAN. The Analysis of the Intermediate Complex Compound Containing Nickel Formed in the Preparation of 4,4'-Dicyanobiphenyl by the Sandmeyer Reaction.
12:15— Divisional luncheon, Hotel Claridge, Balinese Room, $1.15. Speaker, HARRY N. HOLMES, President of the AMERICAN CHEMICAL SOCIETY.

C. E. WHITE, *Presiding*

2:30—28. W. J. L. WALLACE AND THEODORE AUSTIN. Variation of Index of Refraction with Concentration in Aqueous Solutions of Glycine and *dl*-Alanine.
2:40—29. IBERT WELLS. The Chemistry of Vitamin B_1.
2:55—30. E. M. BURAS, JR. Hydrolysis of Alkaline Earth Sulfides.
3:10—31. R. R. PHILLIPS. Theories of Catalysis.
3:25—32. JOHN STERLING. Synthetic Rubber Polymerization.
3:40—33. HUBERT DUBOIS. Alkalies, Magnesium and Sulfur Compounds in Portland Cement.

Division of Colloid Chemistry

FRED OLSON, *Chairman;* J. W. MCBAIN, *Secretary*
GEORGE N. FERGUSON, *Local Assistant*

Auditorium, Room J

Thursday Morning

10:00— 1. J. W. MCBAIN. Application of the Phase Rule to Soap Boiling.
10:30— 2. W. O. MILLIGAN, HARRY B. WEISER, AND JOHN M. MARSHALL, JR. X-Ray Diffraction Studies on Precipitated Cuprous and Cupric Sulfides.
11:00— 3. C. E. MARSHALL AND C. A. KRINBILL. The Electrochemical Properties of Mineral Membranes. V. Beidellite Membranes and the Determination of Sodium.
11:30— 4. SYDNEY ROSS. Measurement of Foam and Emulsion Stabilities in Characteristic Units.
12:15— Divisional luncheon, DeVoy Hotel, Room A-B, $1.15.

Division of Gas and Fuel Chemistry

O. W. REES, *Chairman;* G. R. YOHE, *Secretary*
HERBERT FISHBURN, *Local Assistant*

Auditorium, Room F

Wednesday Afternoon

2:00— 1. O. W. REES. Introductory Remarks.
2:15— 2. MARTIN A. ELLIOTT AND L. B. BERGER. Studying Combustion in the Diesel Engine by Addition of Gaseous Combustibles to the Intake Air.
2:45— 3. L. L. HIRST, A. EISNER, J. H. FIELD, H. M. COOPER, R. F. ABERNETHY, AND H. H. STORCH. Hydrogenation and Liquefaction of Coal. IV. Characterization of Assay Oils.
3:15— 4. GEORGE W. LAND. The Application of Radiographic Methods to the Problem of the Absorption of Liquids by Coal.
3:40— 5. G. R. YOHE AND MYRON H. WILT. The Oxidizing Power of Illinois Coal. II. The Effects of Extended Time.
4:00— 6. O. W. REES AND K. F. BURSACK. The Use of a New Type of Equipment for Determining Moisture in Coal.

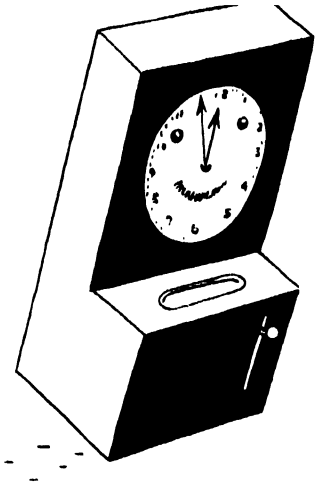
Division of the History of Chemistry

HARRISON HALE, *Chairman;* RALPH E. OESPER, *Secretary*
OGDEN BAINE, *Local Assistant*

Auditorium, Room E

Tuesday Morning

SYMPOSIUM ON THE HISTORY OF CHEMISTRY IN THE SOUTH



9:00— 1. HARRISON HALE. Introductory Remarks.
9:05— 2. JOHN XAN. History of Chemistry in Alabama.
9:20— 3. P. G. HORTON AND HARRISON HALE. History of Chemistry in Arkansas.
9:40— 4. OGDEN BAINE. History of Chemical Education in Tennessee.
10:00— 5. M. HUME BEDFORD. Some Representative Chemists of Kentucky.
10:15— 6. E. A. FIEGER. History of Chemistry in Louisiana. Development of the Sugar Cane Industry.
10:30— 7. J. E. COPENHAVER. History of Chemistry in South Carolina.
10:45— 8. WORTLEY F. RUDD. History of Chemistry and Chemical Education in Virginia.
11.00— 9. TOWNES R. LEIGH. Brief History of Chemistry in the Colleges and Universities in Florida.

Wednesday Morning

GENERAL PAPERS

9:00—10. JOHN T. CHAPPELL. Chemical Gleanings from the Bible.

CONTINUED ON PAGE 402

BUSINESS AS UNUSUAL

Eagle Eye* Reports Briefly on NATIONAL DEFENSE and Temperature Controllers

(with no appreciable assistance from the censors)

"Business as *un*usual is the only way to describe this company, today. Never in its brief but busy history have I seen so much activity. New materials, methods, and demands require daily adjustments and these people seem to thrive on them. But then, Wheelco has always pioneered the new and *un*usual.

"Production has been increased. The constant inward flow of material passes an outward flow of finished instruments, and every one is used for National Defense Production.

"As an example, today I heard a stranger (he might have been a government inspector) asking our sales manager about some of the instruments they had just seen in the shipping room."

Stranger, " 'What are those instruments called LIMITROLS and where are the ones I saw going?' "

Sales Manager, " 'LIMITROLS are automatic shut-off controls. They protect against overheating, and even protect the equipment from failure of its controller. Those LIMITROLS are going to The [redacted] Co. to be used on furnaces for heat treating machine gun barrels.' "

Stranger, " 'I saw a lot of CAPACITROLS. What are they?' "

Sales Manager, " 'They are the most famous of the "Radio Principle" Controllers. You name the places where *closer* temperature control is imperative and you will have a list of CAPACITROL installations.' "

Stranger, " 'What are FLAME-OTROLS?' "

Sales Manager, " 'Insurance against combustion explosions, and, believe me, we're selling a lot of them these days. No one can afford any explosion that might interrupt defense production.' "

Stranger, " 'Just one more question. Those POTENTIO-TROLS . . .?' "

Sales Manager, " 'They are the Rolls-Royce of temperature controllers. The ones you saw will control the treating temperatures of hair springs used in the noses of shells. They are being shipped to the [redacted], at [redacted], [redacted], but let me tell you about PROPORTIONING CONTROL, PROGRAM CONTROL, REMOTE CONTROLLERS, RHEOTROLS, THERM-OTROLS, ...' "

Stranger, (interrupting) " 'I'd like to hear it but I have to hurry. Maybe some other time.' "

Sales Manager (*calling after him*) " **'I'll send you a complete catalog.** (*Aside*) **Or to anyone else who wants more information on Wheelco equipment.'** "

"That's all I have time to tell you now. Here comes the night shift. I'll try to tell you more later. In the meantime you'd better accept that offer of free literature."

Eagle Eye

* Eagle Eye is our Master Time Clock. He keeps his eye set on all our comings and goings and occasionally issues timely bulletins on timely topics as they relate to Wheelco Instruments Co., 851 West Harrison Street, Chicago, Illinois.

"The most important advance in chemistry since the development of coal tar derivatives"

Only once or twice in a lifetime is the chemical industry offered an opportunity for productive research such as the Nitroparaffins offer today. For the NP's are much more than just another group of interesting compounds . . . they open an entirely new field of organic chemistry . . . promise to rival the coal tars themselves.

Pharmaceuticals, dyestuffs, insecticides, rubber chemicals, photographic developers, textile chemicals, resins, polishes, cleaning compounds, protective coatings, creams and lotions—these are a few of the more important products which have already been made from the Nitroparaffins and their derivatives. Yet, investigation of their usefulness has hardly begun.

Chemists who are preparing today for the needs of tomorrow will find in the NP's the answer to many a baffling problem. We shall be pleased to supply technical information and samples.

ARE you finding it increasingly difficult to obtain Blanc Fixe? Here is the solution to your problem—WITCO BLANCAL—a NEW product developed in the Wishnick-Tumpeer Laboratories. WITCO BLANCAL is a precipitated barium-calcium compound—in both low and high oil grades. Because it is an extremely finely divided extender, having excellent color in dry state as well as under oil, WITCO BLANCAL is practically certain to give you even better results than Blanc Fixe! And because less is needed in your formulations, due to its higher bulking value, you will find it more economical. Take this opportunity NOW to improve the quality of your products and at the same time make a substantial saving in cost. Our staff will gladly assist you in using this new development in your products. Mail the coupon for a sample today.

WISHNICK-TUMPEER, INC.

MANUFACTURERS AND EXPORTERS

New York, 295 Madison Ave. • Boston, 141 Milk St. • Chicago, Tribune Tower • Cleveland, 616 St. Clair Ave., N. E. • Witco Affiliates: Witco Oil & Gas Company • The Pioneer Asphalt Company • Panhandle Carbon Company • Foreign Office, London, England

WISHNICK-TUMPEER, INC.

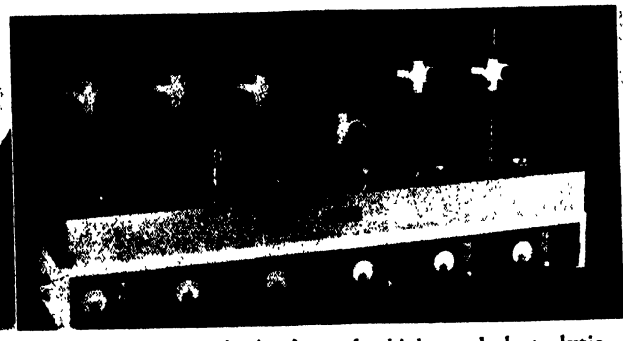
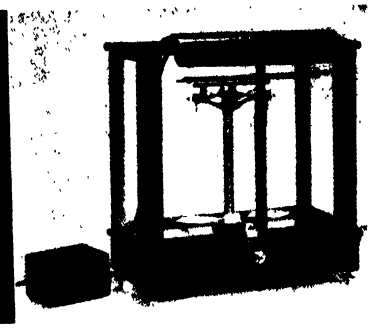
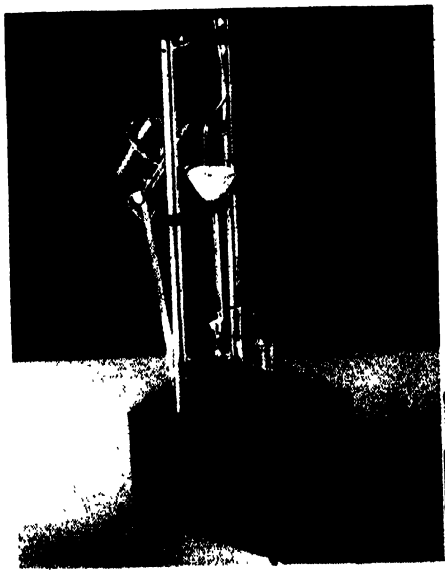
Siemin Electrolytic Analyzer. For rapid analysis of metallurgical products. Self contained—portable—economical. Literature on request.



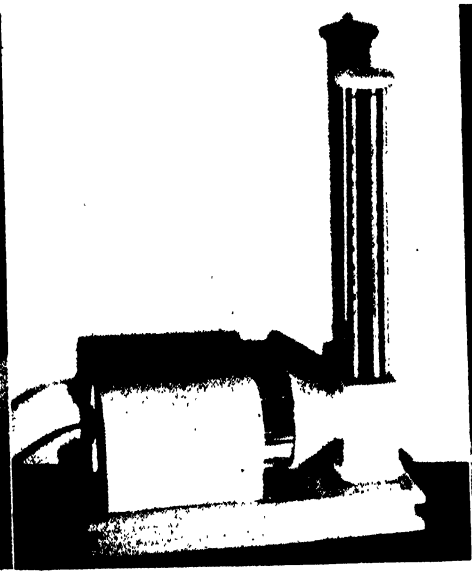
Micro and semi-micro Centrifuges. Safe —no external moving parts. Speeds 3300 to 4400 r.p.m. Complete precipitation in 30 to 120 seconds. Prices $28.50 to $34.00.



Heyrovsky Polarograph American Model XI. Booklet describing this instrument and principles of polarographic analysis, and a bibliography of more than 700 papers are available on request.



Sargent Bottle Inclinator. A convenient and safe method of dispensing acids. No. S-9620. Price $1.50.

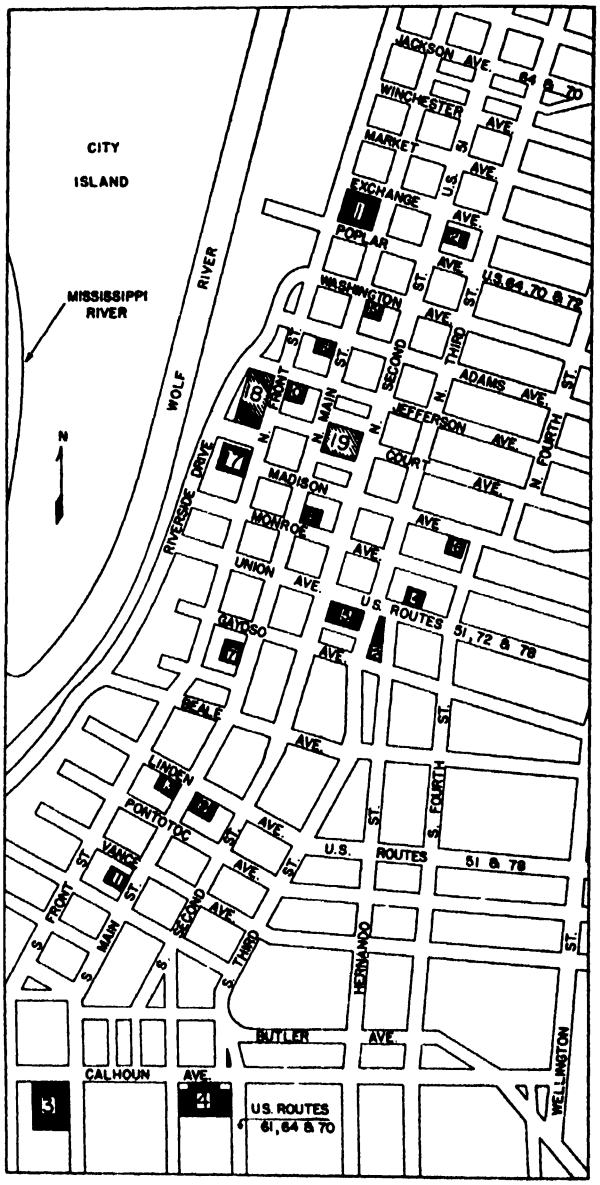


Sargent Electrolytic Analyzer for high speed electrolytic analysis. Heavy duty, Magnetic Stirring, Water Cooled. No. S-29405. Literature on request.

Sargent Balance Lamp. Soft fluorescent illumination on all parts of balance. No. S-3820. Price $11.50.

Mechanized Filtration. Acting in robot-like fashion—does a complete and continuous filtration without personal supervision. No. S-33400. Price $64.00.

Sargent Continuous Indicating Wet and Dry Bulb Motor Ventilated Hygrometer. Readings are made with no manipulation. No. S-42605. Price $50.00.



Sargent Fluorescent Titration Illuminator. Supplies soft, glareless, indirect fluorescent illumination of correct color characteristics. No. S-44290. Price $13.00.

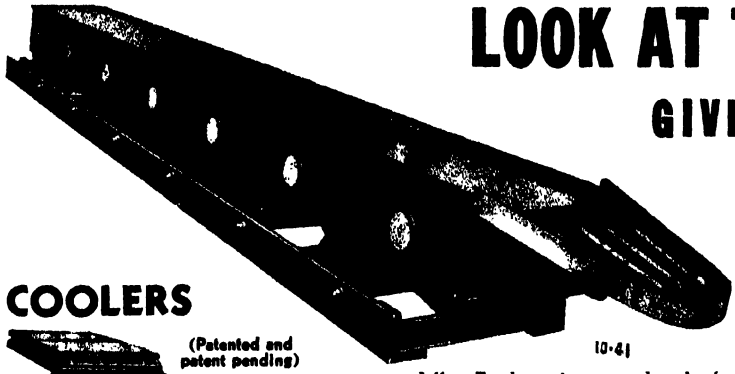
CHEMICAL PRODUCTS ESSENTIAL TO PRODUCTION

Farsightedness in normal times makes us ready in an emergency.... Harshaw research in industrial problems during past years has developed many essential industrial chemicals needed today — it has improved quality and standardized purity, assuring industry of efficient and dependable production — and — it has developed processes for making materials that have suddenly become of vast importance in war time production. Many materials were novelties a very few years ago — today they are key materials in refining of petroleum, making of synthetic rubber and in other industrial applications. The work done on mineral deficiencies of farm products is also important to national health and for increasing farm production.

Many of the products of peace time imagination are today helping America toward victory.

Vital Chemical Materials



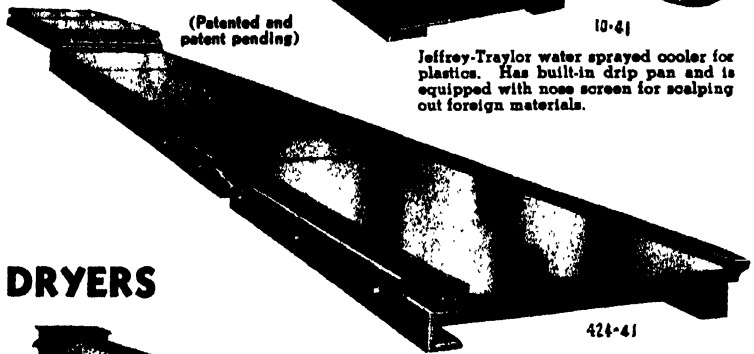
- Anhydrous Hydrogen Chloride
- Anhydrous Hydrogen Fluoride
- Anhydrous Boron Trifluoride
- Aluminum Salts
- Antimony Salts
- Cadmium Pigments
- Chromium Salts
- Cobalt Salts
- Manganese Salts
- Nickel Salts

THE HARSHAW CHEMICAL CO.

Cleveland, Ohio, and Principal Cities

LOOK AT THESE THREE UNITS

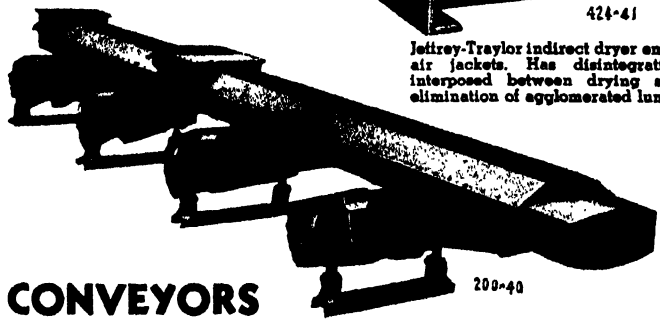
GIVE BALANCED VIBRATION TO PROCESSING OPERATIONS



COOLERS

(Patented and patent pending)

10-41



Jeffrey-Traylor water sprayed cooler for plastics. Has built-in drip pan and is equipped with nose screen for scalping out foreign materials.

DRYERS

424-41

Jeffrey-Traylor indirect dryer employing hot air jackets. Has disintegrating screen interposed between drying sections for elimination of agglomerated lumps.

CONVEYORS

209-40

In Jeffrey-Traylor drying and cooling systems the rate and depth of material being conveyed is automatically controlled—changed to conform with varying requirements as material travels through various operations.

Direct type coolers and dryers furnished with either perforated or louvered conveying surface through which drying or cooling air or gasses are passed. Indirect type have solid conveying surface, adaptable for handling fine materials. These units specially valuable for processing under closely-controlled conditions.

Jeffrey-Traylor electric vibrating conveyors (left-below) handle hot, gaseous material without dust loss or degradation. Tubular or pan types in various sizes and capacities. Positive control over tonnage.

ACE

Sulphur Determination Apparatus

A.S.T.M. D-90

Design as Approved by A.S.T.M. Committee D-2

For DETERMINATION OF SULPHUR IN PETROLEUM OILS

This compact sturdy unit is fabricated entirely from Pyrex glass, with Ace Fiber Filter disc sealed in. Standard taper interchangeable joints permit easy assembly and quick, economical replacement of broken parts.

CATALOG NO. 8027-A	
Absorber	$ 8.80
Chimney	2.30
Burner	2.92
Splash Bulb	3.03
Flask	1.05
Price Complete	$18.10

Our Engineering Department

is at your service to aid in the fabrication of apparatus to your design or specifications.

ACE GLASS INCORPORATED

VINELAND • NEW JERSEY

Quality Glassware for Laboratory and Industry

Hand operation of hoist and carrier on straight line process system.

PUT your floor space to better use by putting your carrying jobs overhead. Eliminate floor congestion. Relieve your men from lifting and carrying—they'll accomplish more by giving their full time and skill to production. These are but a few of the benefits derived from American MonoRail Equipment.

At no obligation an American MonoRail Engineer, through long experience, may be able to show you how to speed up your production.

Annual New York Section Students' Meeting Scheduled

The annual students' program sponsored by the New York Section of the American Chemical Society is scheduled at the Hotel Pennsylvania, New York, April 10, at 5:00 P. M. Seniors majoring in chemistry and chemical engineering and graduate students from 12 schools in the metropolitan area will present research papers. Undergraduate juniors and seniors majoring in chemistry, student affiliates, graduate students, and junior members of the Society are invited to attend. A special students' dinner will be held at 6:30 P. M. The price is 75 cents each and tickets must be obtained in advance at colleges and universities throughout the city. Students may attend the regular meeting of the section at 8:00 P.M.

Student Program

Physical Chemistry (Inorganic)

H. H. Baker, Jr., *Presiding*

Leo Garfinkel. Some Aspects of the Nitroprusside–Nitrito Pentacyano Ferroate System.
E. Giolito. Analysis and Measurement of the Dielectric Constant.
Kenneth J. McCallum. Experimental Determination of the Electron Affinity of Chlorine.

Physical Chemistry (Organic)

David Perlman, *Presiding*

Kenneth Sancier. Electrolytic Reduction of Nitrobenzene in Liquid Ammonia.
Felix Wroblewski. Racemization of Optically Active Hydantoins.
Sidney Weiss. Reduction of Beta-Diketones at the Dropping Mercury Electrode.

Organic Chemistry

Thomas B. Dorris, *Presiding*

Robert Fuchs. Invert Soaps: Morpholinium Salts.
Herbert S. Cockeram. Aleuritic Acid: Reaction with Acetone.
Joseph G. Sandza. Pantothenic Acid and the Vitamin B Complex.

Chemical Engineering

James M. Church, *Presiding*

Phillip E. Tobias. Theory of Tie Lines in Ternary Liquid Systems.
E. J. Goett. Process for the Manufacture of Methyl Chloroacrylate.
C. R. Giannotta. An Experimental Gas-Fired Furnace.

Combined Divisions

Harold A. Horan, *Presiding.*

Marion D. Barnes. Fading of Phenolphthalein by Hydroxyl Ion.

Twenty-Fifth Anniversary of Fan Manufacturers

The National Association of Fan Manufacturers celebrated its 25th anniversary in connection with its annual meeting at Detroit, Mich., February 12. The following officers were elected for the ensuing year: J. M. Birkenstock, president; Edgar F. Wendt, vice president; and L. O. Monroe, secretary-treasurer.

The association announces that its third edition of "Standard Methods for Centrifugal and Axial Fans" will soon be available for distribution, as well as a new code on "Sound Measurement of Centrifugal and Axial Fans".

Midwest Power Conference

Leland Olds, chairman of the Federal Power Commission, and Willard Chevalier, publisher of *Business Week* and vice president of McGraw-Hill will be the headline speakers at the Midwest Power Conference, April 9 to 10, in Chicago.

Mr. Olds will speak on "Power and the War Effort", and his speech will feature the opening session of the meeting. Mr. Chevalier will be the featured speaker at the All Engineers Dinner, which is the social highlight of the program.

Outside of the usual formalities, the entire opening session of the conference will be devoted to the Nation's power problem.

Fluorspar Industry Sets New Record in 1941

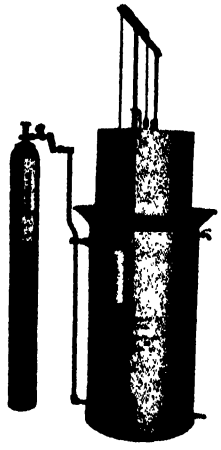
The domestic fluorspar industry was called upon to supply an unprecedented demand in 1941 to meet requirements of steel mills and aluminum plants, both of which set new production records, and the greatly accelerated needs of manufacturers of glass, enamel, and hydrofluoric acid, according to final 1941 figures reported by the U. S. Bureau of Mines.

Shipments from mines in 1941, amounting to 320,669 short tons, were 37 per cent greater than in 1940 and 22 per cent more than the previous record of 263,817 tons made in 1918. The 1941 shipments were sufficient not only to take care of consumption, but also to enable consumers to increase inventories slightly. There was only a small decline in stocks at mines. Sales of imported fluorspar in the United States, however, were 31 per cent less than in 1940.

THE OHIO GASOMETER

For Industrial...Educational... Commercial...Laboratory Work

THE plus value of the Ohio Gasometer makes gas storage in the laboratory no longer a problem.



In addition to all the worth-while features of previous types of storage equipment, the Ohio Gasometer presents a "plus value" because of these and other definite, tangible improvements:

★ Gas Leakage minimized

★ Loss of sealing fluid due to splashing over, prevented

★ Sealing fluid cannot get into line

Get the complete story. Write for catalog and prices. Tell us your requirements.

Available in 1, 2, 4, 6, 8, 10, 15, 25 and 30 cubic foot capacity.

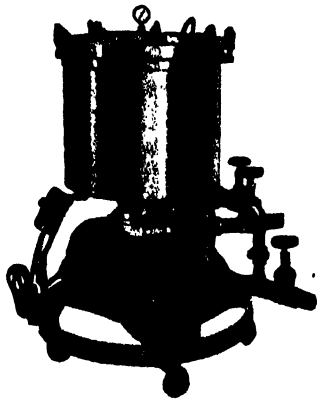
SENIOR AERO-MIX STIRRER

Built for heavy duty this Senior Aero-Mix will develop more than ⅛ H.P. at 65 lbs. air pressure. It will operate on air pressure from 10 to 65 lbs., developing a speed of 2,500 R.P.M. at 10 lbs., requiring approximately 2½ cubic feet of air per minute; to 7,500 R.P.M. no-load speed at 65 lbs., requiring approximately 6 cubic feet of air per minute. Housing is 5" in diameter, equipped with a ground seat, leak-proof air cock to facilitate adjustment of speed and power; 6 ft. rubber air hose, with ¼" I.P.S. threaded coupling for connection to air supply line; yoke type mounting clamp with maximum jaw opening 1½"; clamp mounted on swivel arm with locking lever for setting stirrer at any desired angle; 12" Stainless Steel propeller in ⅜" chuck. Overall shaft length, 16".



E1693 Aero-Mix Stirrer, Senior Model, as described above..... **$42.50**

The Emil Greiner Company

161 Sixth Ave., New York, N. Y.

MODERN FILTERING *demands MODERN FILTERS!*

THE SPARKLER HORIZONTAL PLATE FILTER

Capacities from 10 to 5000 G.P.H.

FOR ALL LIQUIDS
Chemicals
Varnishes Oils
Foods, etc.

SPEED
Consistently, from 25% to 50% faster than old fashioned filters

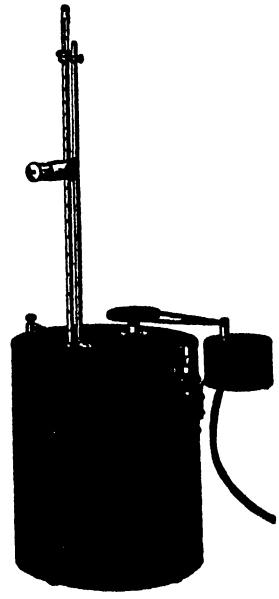
CLEAR FILTRATION
Removes all cloudiness and sediment. Works in combination with modern filter aids

COMPACT
Takes up less space — 25 inches at base; not over 5 feet in height

PORTABLE
Rolled anywhere, more flexible in application

EVAPORATION OR LEAKING
Units completely enclosed to prevent evaporation, no obnoxious fumes

UNFILTERED HOLDOVER
Patented plate removes all filtered liquid



● *Write for Full Details* ●

SPARKLER MANUFACTURING COMPANY

207 LAKE STREET MUNDELEIN, ILLINOIS

PARR INSTRUMENTS

PARR OXYGEN BOMB CALORIMETER

For determining the heat of combustion of any solid or liquid material that can be completely burned in an oxygen combustion bomb, including coals, petroleum products, foodstuffs, organic compounds and numerous other carbonaceous materials. This apparatus is available with either the single valve manually sealed bomb or the double valve self sealing bomb. The jacket is of the constant temperature type, utilizing a dead air space to obtain its high insulating efficiency. Accuracy is well within the permissible tolerance specified for standard calorific tests.

Write for new Bulletin E-63; or get your copy from any authorized dealer in Parr Apparatus.

PARR INSTRUMENT COMPANY · Moline, Ill.

Emergency Actions during A. S. T. M. Committee Week

THE 1942 A. S. T. M. Committee Week, held in Cleveland on March 2 to 6, was featured by emergency actions on important specifications and test methods. More than 520 technologists attended the various committee meetings. Attendance was good at practically all of the 150 meetings, but particularly in such fields as steel, rubber products, petroleum, and road and paving materials.

In the next few weeks a large number of emergency alternate provisions will be issued to expedite procurement or conserve critical materials. Gummed stickers with full details are sent to all who use the Book of A. S. T. M. Standards, and the provisions are also published in the *A. S. T. M. Bulletin*.

Since 1942 is the Book of Standards year when the society will reissue in three parts its widely used volume of specifications and standard tests, many committees were busy bringing up to date the standards work in their charge. Many of these matters will be included in the committee reports to be presented at the 45th A. S. T. M. annual meeting in Atlantic City, N. J., June 22 to 26.

Chicago Section Works with OCD

THE Chicago Section of the AMERICAN CHEMICAL SOCIETY has been asked to cooperate with the Chicago Metropolitan Area Office of Civilian Defense in the development and supervision of the training of instructors in war gas defense for this area. Ward V. Evans, Northwestern University, has been appointed chief gas training officer. Dr. Evans presented the first course of three two-hour lectures during the week of March 16. Chemists and chemically trained persons taking this course are to become instructors in their local communities after examination and certification by the training division. It is expected that the course will be repeated later, and other courses added as soon as they can be developed.

The section also has an active Defense Committee, and a National Defense Forum has been added to the group meetings which follow the monthly meetings.

Frank S. MacGregor, since June 1941 director of the Priorities Division of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., has replaced **Milton Kutz** as assistant general manager of the R. & H. Chemicals Department. Mr. Kutz, who has been on leave of absence because of ill health, will become sales adviser and assistant to the general manager of the R. & H. Chemicals Department.

Lead Contamination

RECENT press reports that materials such as tooth paste can be kept in collapsible tubes made from lead without becoming contaminated are not true. The press drew this conclusion from a paper presented at a recent meeting of the American Institute of Mining and Metallurgical Engineers under the authorship of the undersigned and Messrs. Markus and Grobe. This paper demonstrated that in carbonate solutions in the pH range from 9.5 to 11.2 the tin-lead couple is under cathodic control and the anodic elements are tin. The effect of several addition agents was also demonstrated. The experiments did not deal with any commercial material such as tooth paste or shaving cream, and the corrosion properties of lead alone were not discussed. There is of course no scientific justification for applying the results obtained for the lead-tin couple in carbonate solutions to uncoupled lead in any other environment.

In order to avoid cases of lead contamination, it is important that these facts should be disseminated as widely as possible by scientists who are qualified to understand their implications.

PITTSBURGH, PENNA.

U. S. Rubber to Make TNT

THE United States Rubber Co. has been awarded a contract by the War Department to operate a Pennsylvania plant for the manufacture of trinitrotoluene. The company will consult with the architect, inspect installation of production equipment, and train key personnel. The Government will finance the project and the company will operate on a cost plus fixed fee basis, under direction of its Naugatuck Chemical Division. The company is now operating an ordnance plant in the Middle West for the manufacture of small arms ammunition.

U. S. Cork-Producing Possibilities Studied

EXPERIMENTS in planting cork oak, from which cork is stripped, are planned by the U. S. Department of Agriculture, if the Forest Service can get acorns from the Mediterranean. Normally the United States imports about $10,000,000 worth of cork annually from Spain, Portugal, and North Africa. Parts of the Southwest, southern California, Arizona, New Mexico, and Texas, have a similar climate, and the department believes cork should do well here.

From a few cork oaks planted in California more than 70 years ago, good first-yield cork has been gathered under supervision of the Agricultural Extension Service of the University of California. Several native trees produce a kind of cork suitable for several types of products, such as heat insulation and packing material. These include Southwestern fir and the more common Douglas fir. White fir also offers some possibilities.

Civilian Use of Gas Masks

THE cry now going up for civilian gas masks, if heeded, will result in a crime of the first magnitude against our offense effort", Joel H. Hildebrand, chairman of the Department of Chemistry, University of California, and codesigner of the American Army gas mask of 1918, said in addressing the Commonwealth Club of California in San Francisco, March 6.

Continuing, Dr. Hildebrand said:

Unless you are some sort of warden, you have little excuse for being exposed to toxic gas. You should stay indoors, where you are better protected without a gas mask than you would be out-of-doors with one.

Close all doors and windows and shut off any furnace that draws air in from the outside. Seal the cracks, if you are very nervous, with tape or wet rags or paper. Go to the upper floors and wait for the gas to blow away or for the street squads to disinfect. Breathe through a wet towel, and, if this is not sufficient comfort, put your head under a pillow and pray.

You do not need a gas mask and you are disloyal to our fighters if you demand one when labor, rubber, and other materials are so vitally needed for fighting purposes.

Production and Consumption of Mercury Drop Slightly

CONSUMPTION of mercury declined from 3,900 flasks in December 1941 to 3,800 in January 1942, while production was falling from 3,900 to 3,700 flasks. Certain strategic materials, including mercury, were placed under import control late in December. General Import Order M-63 provides that, unless otherwise authorized by WPB, contracts for imports of these materials will be handled by the Metals Reserve Company. Conservation Order M-78, issued by WPB in January, limited the use of mercury for all purposes not considered essential. Mercury prices throughout the month averaged $202.519.

Stocks in consumers' and dealers' hands, calculated from reports covering 93 per cent of metal on hand at the end of December, amounted to 12,900 flasks and producers' stocks were at least 573 flasks, compared with 12,400 and 439 flasks, respectively, at the end of December. Stocks of metal in the hands of consumers of redistilled metal only at the end of December were 1,600 flasks in addition to those reported above.

FOR A VERY LOW COST

You Get the Purest Distilled Water

AS LOW AS ½ CENT A GALLON

Barnstead Water Stills give you the purest distilled water at the lowest possible cost — the modern Barnstead Steam Heated Stills, for example, produce distillates for as low as ½ cent per gallon.

This is to your advantage. First — because it gives you distilled water pure enough for delicate laboratory work and second — because it gives you pure water cheap enough for actual plant production. Moreover, Barnstead Stills are designed and constructed for years of continuous service — and to operate with a minimum of service.

Send for complete catalog showing all sizes ranging from ½ to 500 gallons per hour.

WORLD-WIDE CHEMISTRY

The Sociedad Industrial Pizareño S. A., Santiago, which manufactures asbestos cement from domestic raw materials, has started making and erecting prefabricated houses for workers from this material. The houses are fire-, weather-, and earthquake-proof. They can be erected without any iron or steel, an important factor because of the scarcity of these materials in Chile. The president of this firm, Rudolfo Jaramillo Bruce, studied the system of prefabricated housing in the United States last year. His factory has made various articles from asbestos cement for many years with so much success that not only in Chile but also in parts of Peru and Bolivia asbestos-cement roofs are called Pizareños.

Government Helps Industry Promote Steel Production

The government has promised every kind of aid to the Sociedad Siderúrgicade Valdivia so that this company will be able to complete the second furnace at Corral as soon as possible and boost pig iron production to 40,000 metric tons a year. This amount of pig iron and the scrap available in the country, export of which is prohibited, will make possible production of 50,000 tons of steel products yearly, enough for the more urgent needs.

The Yugoslavian metallurgical engineer, Stephen Rusicka, inventor of the process to manufacture metallurgical coke from wood coal, has been hired by the Corporación de Fomento and brought to Chile. Mr. Rusicka has supervised the workings of a pilot plant, and his findings are that the metallurgical coke produced is of excellent quality, free from ashes and sulfur, and cheaper than imported coke.

Petroleum Group, Similar to A. P. I., Is Organized

During the recent Pan-American Congress of Mining and Geology the Comité Chile del Instituto Sudamericano de Petroleo, similar in many aspects to the American Petroleum Institute, was formed. The provisional directory consists of engineers and chemists—Hector Marchant, Osvaldo Vergara, Roberto Mueller, Marín Rodriguez, who is president of the Mining and Geology Congress, Carlos Ponce de León, Manuel Zañartu, F. Thomas, Hernán Besa, and Alberto Cabero.

New Bituminous Coal Deposits Are Opened

Work has started on the newly opened bituminous coal deposits at Hueyusca, Department of Osorno, Province of Valdivia. The mined product seems to be of very good quality. An analysis made by the laboratory of the Corporación de Fomento showed an average content of 6.120 calories.

Local Manufacture of Caffeine Started

The Droguería del Pacífico S. A., Valparaiso, has started to manufacture caffeine at its factories at Llay-Llay Department of Quillota, Province of Aconcágua. The product will be made from imported coffee. Production is planned only to cover Chilean needs during the war, because prices of this product have run up to over $20 per kilogram, f. o. b. New York. Yearly consumption in Chile is about 2,000 kg. a year, and stocks are very low.

Loans Granted to Help In Establishing Industries

The Corporación de Fomento has granted the following loans to:

Sociedad Coricola Chilena, Ltda., 500,000 Chilean dollars, for growing mulberry trees and developing the industry of natural silk in Chile.

Cooperativa Lechera de Bio-Bio, 150,000 Chilean dollars, for increasing the capacity for producing condensed and powdered milk; 400,000 Chilean dollars for finishing equipment for a fruit-drying plant in Aconcágua.

Compañía Yoduradora de Cobre, 107,181 Chilean dollars against shares of this company for continuing experiments regarding iodining of metals.

Chile Exports Ictiol to Neighbors, Great Britain

Ictiol is made in Chile from bituminous slate, which is very similar in formation and smell to that of Austria. Exports in 1940, mainly to other South American countries and to Great Britain, amounted to over 40 metric tons. Ictiol is now made by three factories, at Santiago, Valparaiso, and Llay-Llay. The slate deposits are mostly in the Province of Aconcágua.

Continental Europe

Production of Calcium Carbide in France Approaches Prewar Figure

Production of calcium carbide in France has suffered greatly as a result of the war, but it is reported that the output is again approaching the 1938 figure of 150,000 tons. Even so, domestic production covers only part of the greatly increased demand for lighting, motor fuel, welding, and chemical manufacture. The demand for gas generators in motor vehicles in particular has increased to such an extent that the Vichy Government had to restrict its use. Civilian consumption has also been restricted; retail sales of acetylene are permitted only against coupons issued by the Petroleum Department.

French Heavy Industries Increase By-Products Output

Shortage of benzene and coal-tar derivatives in many industries has caused French coal and steel producers to concentrate on utilization of by-products. The Mines de Houille de Marles have raised their capital from 208,000,000 to 312,000,000 francs, largely for the extension of the by-product plant. The Société Chimique de la Grande Paroisse

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

has increased its capital from 70,000,000 to 105,000,000 francs. The Aciéries de Longwy, one of the foremost companies in the heavy industries, is to extend its field of activity by starting to manufacture chemical fertilizers. Produits Chimiques et Engrais d'Auby reports that a new plant has been built for the manufacture of several fertilizers. Engrais de Roubaix increased shipments of chemical fertilizers, thanks to the long season, but complains of difficulties in replenishing stocks. The factory at Coudekerque must be extensively repaired owing to damage suffered during the war. The Société des Produits Azotés experienced considerable difficulties in the supply of raw materials for its two principal products, calcium carbide and cyanamide.

French Dunlop Plans to Make Synthetic Rubber

Plans for establishment of a synthetic rubber industry in France have been announced by the Dunlop Co. which has used Buna supplied from Germany for some time. Stocks of natural rubber in France have been exhausted, and further dismissals of large numbers of workers would, it is announced, have been necessary had not supplies of Buna been received from Germany and French factories been converted to the manufacture of goods from synthetic rubber.

Before the war experiments with rubber substitutes in France did not go beyond scientific tests. Although some progress has been made meantime, it is pointed out that shortage of construction material, coal, and electric power represents serious handicaps for the establishment of a synthetic rubber industry in the country. Germany, interested in the proposition because of the large orders placed by the occupation army with French aircraft and truck manufacturers, may assist in the supply of equipment.

Nitrogen Industry In France Concentrated

Following concentration of the French nitrogen industry in the Groupement de l'Industrie de l'Azote, a new company, Société de Gestion de Groupement de l'Industrie de l'Azote, has been formed with a capital divided into 620 shares, of which Kuhlmann has taken 300, Grande Paroisse 140, St. Gobain 100, and Produits Azotés 60. The remaining shares are held by gas interests.

French Firm to Produce Methanol and Acetic Acid

The Société de Produits de Bois is erecting a large, modern factory near Chaumont, in the department Marne, for the distillation of wood. Methanol and

A fleet of trucks like this guard the Pennsylvania Turnpike. In designing them, National coordinated the recommendations of truck manufacturers, first-aid suppliers, towing-equipment manufacturers and others . . . and welded complete units for specialized fire-fighting!

TURNPIKE FIRE-FIGHTER *Designed by* NATIONAL!

The Pennsylvania Turnpike—the world's most modern road; the prophecy of highways to come—is ready for fire anywhere along its 160-mile length!

And it got *ready* . . . as the road was being built . . . through the foresight of the Turnpike Commission and the engineering facilities of National Foam System, Inc.

Here is an example of the experience, ingenuity and versatility which National can bring to bear on any fire-protection problem.

National built-in systems and portable units—employing Chemical Foam, Mechanical Foam or Carbon Dioxide—are on guard today throughout the chemical and metallurgical industries. And each system was designed by National to overcome particular fire-hazards.

National will gladly study your fire-protection problems . . . and make recommendations without obligation to you. Write for Bulletin C3.

The* Only *Chemical Foam That Can Extinguish Polar Organic-Solvent Fires!

Alcohol, ether, ketones, esters and mixed polar solvents immediately break down ordinary foam bubbles. *Yet they can't touch National "99".* Every test has shown that! Listed by the Underwriters' and Factory Mutual Laboratories, National "99" is an exclusive National development!

In every branch of the Chemical Industry, NUCHAR Active Carbon demonstrates its ability to attract and adsorb the impurities which cause objectionable tastes, colors, and odors.

The ability of NUCHAR to remove "off" tastes is being demonstrated each day to the household consumer, where the food products such as gelatine, pectin, etc., and the alcoholic beverages such as wine, whiskey, etc., consumed have quite often been NUCHAR treated.

Color and purity are usually associated as being hand in hand. NUCHAR Active Carbon has long proved its efficiency in removing color from oils, fats, sugars, syrups, glycerine, chemicals, etc., by adsorption. In recent years, NUCHAR has played an important role in the ever-expanding organic chemical field. Purification by absorption with NUCHAR has very often replaced older methods of purification so that NUCHAR Active Carbon is truly "The Modern Purifier."

The benefits of NUCHAR for removal of odor have long been realized by manufacturers of gelatine, glycerine, and alcoholic beverages; in fact, they have used NUCHAR for all three of its functions, i.e., taste, color and odor removal. The ability of NUCHAR to remove odors from air is being recognized more and more by manufacturers of air-conditioning equipment, and as this field grows it should become one of the largest consumers of NUCHAR Active Carbon.

acetic acid as well as solid fuels for gas generators will be produced.

Loss of Overseas Supplies Causes Changes in Belgian Chemical Industry

Loss of the overseas supply sources of minerals treated in Belgian smelters has compelled chemical manufacturers who based their output on by-products from the smelting industry to change their programs. Production of sulfuric acid, superphosphates, and mixed fertilizers on the basis of zinc sulfides and rock phosphates had to be largely abandoned, but firms like Produits Chimiques de Tessenderloo and Union Chimique Belge report for 1940–41 that new lines for the domestic market provided some compensation. Belgian agriculture was supplied with adequate quantities of nitrogenous fertilizers, but phosphatic fertilizers are in short supply. While a number of chemicals can no longer be produced, certain organic products have been put on the market. Profits declined substantially as a result of these changes and the loss of overseas markets.

Dutch Rayon Producer Expands the Manufacture of Staple Fibers

The AKU company which owns large rayon interests in Holland, Germany, and other countries announces that its staple fiber factory will probably be completed by August, while the manufacture of cellulose from straw is expected to commence early in 1943. Until then the staple fiber factory will rely on imported cellulose. Its production is to be larger than the present rayon output of the two AKU factories at Arnhem and Ede, estimated at 9,000 tons a year. A factory for the manufacture of casein wool has been nearly finished at Ede, and the machinery now employed on making casein wool at Arnhem will soon be transferred there. The N. V. Onderzoeking-Instituut Research, Arnhem, which was formed some time ago for the centralization of all research work, has equipped a department for investigations into hitherto neglected problems of the cellulose industry. The new laboratory is situated at Utrecht and will cooperate closely with the university in that town.

Germany to Use Annual Plants for Production of Synthetic Fiber

It is officially announced that about 60 per cent of all textile requirements in "Greater Germany" are now covered by synthetic fibers, among which cellwool has made particular headway. Cellwool factories are also situated in Poland, Norway, Holland, Belgium, France, Slovakia, and the Protectorate, but few of these seem to be operating as yet. The high percentage share of synthetic fibers in German textile consumption is due to shortage of natural fibers rather than to any spectacular advances in synthetic fiber production during the past year. Eastern European forests are to be drawn on systematically as a raw material, but in the long run greater reliance is to be placed on annual plants cultivated or collected especially for use in cellulose factories. Water reed, sorghum, *Arundo donax*, sunflower stems, fescue grass, flax chaff, and potato tops have been considered in this connection. Experiments on brake (*Pteridium aquilinum*) have shown that, if stems are treated with 2.2 per cent of sodium hydroxide and 0.8 per cent of sodium sulfide by the usual sulfate process for 6 hours at a temperature of 160° C. (maximum pressure 7.9 atmospheres), a cellulose material is obtained which has a 91.9 per cent content of alpha-cellulose and possesses properties approximating those of a good straw cellulose. Somewhat lower values were obtained by sulfite treatment. Brake cellulose can, it is claimed, be used for the production of a number of papers of medium quality, especially if mixed with cellulose of other origin, but nothing is said about the suitability of the material for production of synthetic fibers.

Concentration Progresses in Nazi Bone Products Industry

Scheidemandel, the leading producer of glue, stearin, candles, animal fertilizers and other chemical products from bones and slaughterhouse waste, has taken over several more interests in companies with similar production, so that this section of the German chemical industry is now widely concentrated. The turnover during the past year was maintained at 1940 levels, which were rather below prewar figures, although demand for bone products like glue, animal fats, and manure has greatly increased.

Deutscher Kaliverein Offers Prize for New Potash Processes

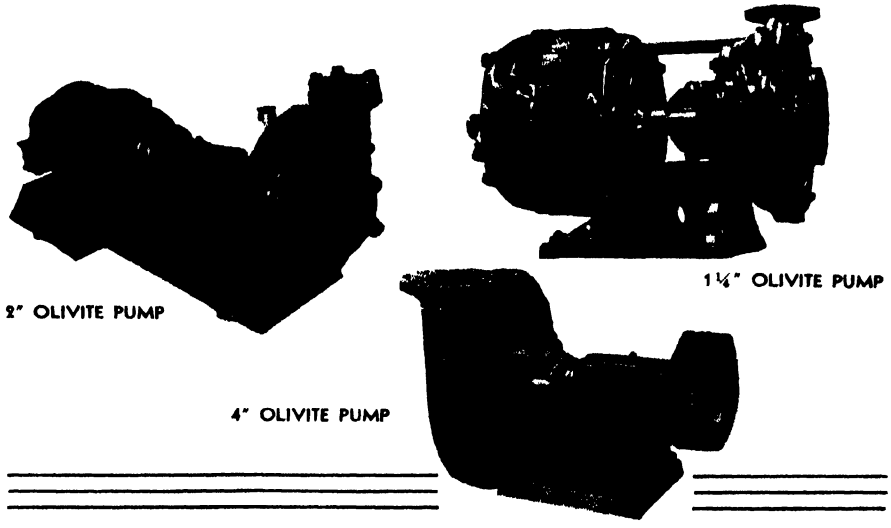
Deutscher Kaliverein has offered prizes of 175,000 marks for new manufacturing processes which permit the treatment of German potash salts without accumulation of waste waters and lyes. Two separate problems are mentioned: treatment of potash salts, and treatment of residues from the solutions of hard salts.

German Research Institutes Study Problem of Slow Nitrogen Fertilizer

How to best maintain the effectiveness of chemical fertilizers in well-drained soils has been studied by German research institutes. Of the condensation products

of cyanamide and urea with formaldehyde, acetaldehyde, and crotonaldehyde, only acetaldehyde-urea proved so resistant against the danger of being drained off that the increase in crops was comparable to that resulting from calcium cyanamide.

Sulfite Lye May Replace Coal-Tar Pitch in Briquets



Zellstoffabrik Waldhof, Mannheim, has been experimenting with sulfite lye as a binder in briquets. Its suitability depends upon plasticity and adhesive power which in turn depend upon the water content. Pitch prepared from beech lyes with 12 to 14 per cent water, from spruce lyes with 13.5 to 15.5 per cent water, or from fermented spruce lyes with 15 to 18 per cent water have similar softening properties as coal-tar pitch which solidifies at 60 to 70 per cent, and may be used in place of the usual grades of pitch for making briquets. The experiments have not yet been completed, but it is believed that utilization of these lyes will help reduce consumption of coal-tar pitch.

New Fuels Are Provided for German Producer Gas Vehicles

Development of new solid fuels which can be used in gas generators for commercial vehicles is being emphasized in Germany. Considerable progress has been made with wood, according to Lt.-Col. Schanze, director of the German generator office, in the development of generator types capable of using wet wood. Although in 1935 best quality beechwood only could be used, soft woods can now be employed in normal generators provided the moisture content does not exceed 20 per cent. Drying has to be brought about by natural processes. The agricultural generator tractor can use wood with 40 per cent moisture, a special advantage in view of the reliance on local fuel for this type of generator.

For road vehicles, however, the tendency is towards the development of generators which use bituminous materials. Anthracite is a very good generator fuel, although the high temperatures reached during carbonization necessitate use of chromium and nickel alloys which are scarce in Germany. Among lignites special grades with low ash and sulfur content can be used directly; for other kinds experiments are under way on reduction of the ash content preparatory to use in generators. An unspecified carbonization process is claimed to yield a product which is superior to charcoal in its application to generator use, but the supply is still very small. Coal itself cannot at present be used, but coke is a generator fuel of growing importance in Germany, and work now under way aims at reduction of the ash content of coke.

60 OLIVITES
RECENTLY ORDERED BY A LARGE CHEMICAL COMPANY

providing additional evidence of the worth of this durable acid-handling pump

WHEN a large company with competent operating and engineering staffs and with plenty of opportunity to make tests under actual operating conditions . . . when such a company put its stamp of approval on a piece of equipment, industry in general can accept that equipment as very worth while for doing work for which it was designed.

This order for 60 Olivite Acid-Handling Pumps comes in that category. It's a significant order, particularly because they are going to handle a variety of hot chemicals such as ferric chloride, sulphuric acid, and hydrochloric acids with them.

If you are handling *any* hot or cold acid or other corrosive solution, you should investigate the Olivite Pump. It should give you lowest cost pumping. As a starter, send for our latest Bulletin—No. 308.

AS MECHANICS GET SCARCER

YOU NEED BETTER MECHANICS IN YOUR MILL . . .

Skilled men are growing scarce — mechanized war demands specialists in every line in the field and in direct armament production.

You need modern equipment that will perform unfailingly — take up the slack and increase production, even with a less skilled working force.

In the newer plants of the process industries, you will find a surprising number of Prater Installations. They are there because they were sold on a guaranteed basis of capacity per horsepower and control of quality. May we do the same for you.

PRATER PULVERIZER COMPANY

PRATER
PULVERIZER COMPANY
1825 South 55th Avenue, Chicago, Illinois

Another process is said to provide a valuable and economical fuel from coal. Coal dust cannot be used, but it may be possible to convert the coal dust into gas outside the generator proper.

While quite a number of different fuels for generator vehicles are thus available, although not all in sufficient quantities, conversion of old motor trucks and other commercial vehicles to generator use is proceeding slowly. A new decree providing that vehicles stationed near sources of town gas, long-distance gas, sewage gas, methane, etc., must be converted to these fuel materials indicates that German authorities are not too eager to increase the consumption of generator fuels at the present time. Passenger cars are not admitted for conversion.

Oppanol Employed on Large Scale in Chemical Apparatus

Oppanol, the polymerization product of isobutylene produced by I. G. Farbenindustrie, is used largely with various fillers, as its resistance to acids and alkalies is actually increased by suitable admixtures. Oppanol foils are employed in construction as a protection against subsoil water. ORG foils, foils of Oppanol with fillers, are used for the same purpose and on a larger scale for covering tanks and containers in chemical apparatus.

The mechanical strength of the material does not equal that of polyvinyl chloride basis foils but is considered adequate. Adhesion to metal and wood is secured by cold glues, but there are special adhesives to make the foils stick to concrete. Seams are welded under pressure at temperatures around 300° C., usually with special welding equipment. ORG hoses are fitted to many metal, wood, and concrete pipes where normal temperatures do not drop below −50° C. or rise beyond +100° or in special cases 130° C. ORG foils are said to offer an economic substitute for lead and rubber covers.

Preparations Completed for Danish Fertilizer Industry

Plans have been worked out for establishment of a nitrogenous fertilizer industry in Denmark. A power station, coke-oven plant, and ammonia works are to be built at a total cost of 200,000,000 kroner, of which 45,000,000 kroner are to be used for the fertilizer factory proper. The Municipal Council of Copenhagen is interested in the project which is shortly to be put into operation.

Tanning Extracts to Be Manufactured in Denmark

Investigations by the Association of Danish Leather Manufacturers have led to formation of a company with a capital of 600,000 kroner which is to build a factory for tanning extracts at Gribskov. The plant will produce 1,200 to 1,500 tons of tanning materials from oak wood and spruce bark and cover about half the local requirements. The plans have been approved by the government because supplies of tanning extracts from abroad have suffered greatly from the war.

Norsk Hydro Plans New Chemical Enterprises

Norsk Hydro Elektrisk Kvaelstof A.S., the big Norwegian company which operates various electrochemical plants, has been engaged in the development of new plans to utilize surplus electric power. Some of the old established sections of the company's industrial output program had to be curtailed because of lack of overseas markets and difficulties of transportation. Norsk Hydro will, it is reported, cooperate with German interests in electrometallurgical production and may commence the manufacture of some new chemical products.

Construction of Fertilizer Plant in Bahamas Rumored

INTEREST attaches to the report of impending construction of a fertilizer plant in the Bahamas, which so far has not been officially confirmed. Agriculture is an important phase of Bahama activity, and fertilizers must be imported, although in relatively low amounts.

New Chemical Plants Established in Mexico

MANUFACTURE of calcium carbide is being undertaken in a new plant in Mexico at Guadelajara, operated by a Spanish refugee and financed with Swedish capital, according to the U. S. Department of Commerce. Plants also are being established, it is reported, for manufacture of cellulose, small rubber articles, yeast, packings for machinery, paper, refined sugar cane, cement, and vegetable oil.

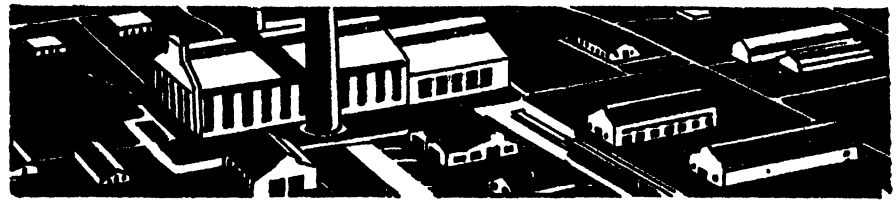
New Zealand Licenses Manufacture of Agar

TO MEET war conditions New Zealand authorities have recently placed under license all manufacture of agar. Large quantities of seaweed are available for raw material, and it is hoped that once production has been established, further imports will be obviated. Agar is needed for hospital use, scientific purposes, and canning of meat and fish.

Development of mineral resources in Brazil has shown a steady and remarkable increase since 1928, being more pronounced after 1931 under the government of President Vargas. Recently the press reported that orders amounting to $33,000,000 have been placed in the United States by the Companhia Siderurgica Nacional, a joint governmental and private enterprise, for 55 coke ovens including plants for the production of ammonia, tar, benzene, and toluene. All the machinery will be installed at Volta Redonda, near Barra Mansa, in the state of Rio de Janeiro, in which the steelworks will be built.

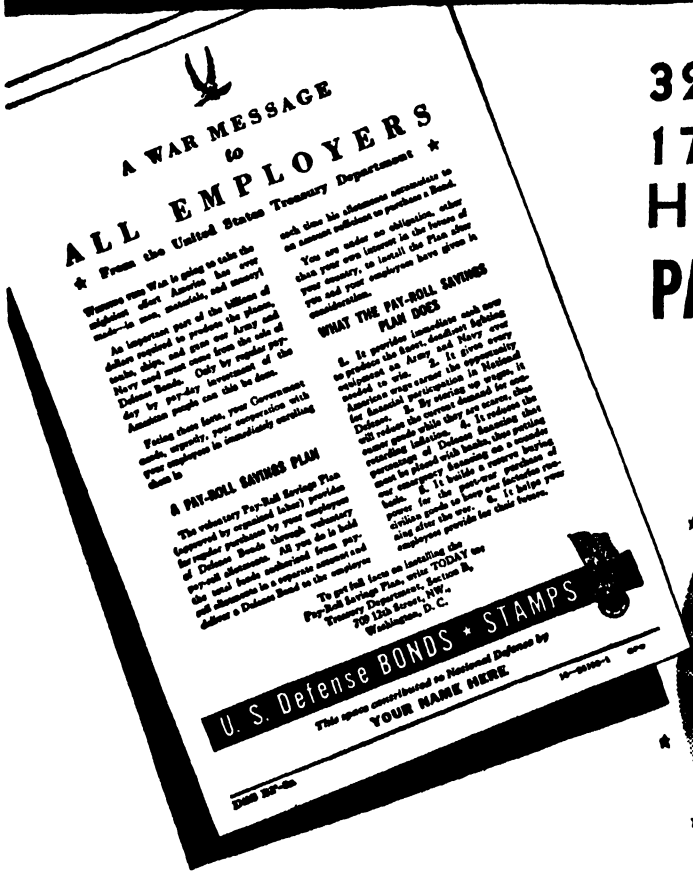
President Vargas has approved a recommendation of the Federal Council for Foreign Trade that technical and financial research should be conducted on the possibility of developing deposits of nickel, cobalt, and copper at Buritĺ in the state of Goyaz and at Liberdade in the state of Minas Geraes on a sound profitable basis.

Rapid growth of the iron, steel, and allied industries in Brazil was discussed in a recent publication issued by the Federal Council for Foreign Trade. Industries using tin, lead, copper, and aluminum depended largely on imported raw materials. Brazil will be able to dispense with some of those raw materials in the near future, it was said. Two plants for production of aluminum from Brazilian bauxite ores are to be erected, one near the city of São Paulo and the other at Ouro Preto in the state of Minas Geraes. To facilitate the establishment of plants for the production of aluminum from Brazilian bauxite ore, the government has authorized the Bank of Brazil to extend to 12 years the limit for the repayment of a loan granted to the Companhia Brasileira de Aluminio S. A. Although about 10,000 tons of pig and sheet lead are imported yearly, the lead and silver plant inaugurated this year in Apiaĺ, state of São Paulo, will supply the major requirements of those metals to local industries.



Copper deposits in the states of Rio Grande do Sul and Paraíba are being worked to supply Brazilian industries. Press notices in Rio de Janeiro recently reported the beginning of exploitation of two new tin mines in the state of Rio Grande do Sul. Cassiterite is also found in the Picuĺ and Soledade zones, state of Paraíba, where surveys for copper mining are being carried out by Brazilian technicians belonging to the Departamento Nacional da Produção Mineral, a federal organization controlling mineral resources.

The bulletin issued by the Federal Council for Foreign Trade showed that goods manufactured of iron, aluminum, copper, and other metals increased from 21,533 metric tons in 1928 to 52,501 metric tons in 1939. During the same period tinplated and enameled iron, also including aluminumware, rose from 4,123 to almost 16,000 metric tons. Brazil is almost self-sufficient in scissors, penknives, and table cutlery, of which small exportations have already been made. Imports of nails, screws, and rivets decreased from 4,824 metric tons in 1928 to only 307 tons in 1940, while production rose from practically nothing to almost 22,000 metric tons in 1940. Since Brazil is able to produce locally hinges, locks, padlocks, and similar goods, imports of these articles dropped from 1,913 metric tons in 1928 to 253 in 1940. Steel office furniture, safes, dentists' and barbers' chairs, ice chests, enameled iron baths, and sanitary ware are manufactured on a scale sufficiently large to fill the country's requirements.



Exportations of chief minerals during the first eight months of 1941 compared with the whole year of 1940, together with the percentages of each country of destination, as recently published by the Federal Council for Foreign Trade are:

Minerals and Other Commodities	Tonnage Exported		Destination in 1941

INDUSTRY ANSWERS THE CALL!

32,145 Firms With Over 17,700,000 Employees Have Installed the . . .

PAY-ROLL SAVINGS PLAN

Have YOU Started the Pay-Roll Savings Plan in YOUR Company?

Like a strong, healthy wind, the Pay-Roll Savings Plan is sweeping America! Already more than 32,000 firms, large and small, have adopted the Plan, with a total of over seventeen million employees—and the number is swelling hourly.

But time is short!..More and more billions are needed, and needed fast, to help buy the guns, tanks, planes, and ships America's fighting forces *must* have. The best and quickest way to raise this money is by giving *every* American wage earner a chance to participate in the regular, systematic purchase of Defense Bonds. The Plan provides the one perfect means of sluicing a part of ALL America's income into the Defense Bond channel regularly every pay-day in an ever-rising flood.

Do *your* part by installing the Pay-Roll Savings Plan *now*. For truly, in this war, this *people's* war, VICTORY BEGINS AT THE PAY WINDOW.

Plan Easy to Install

Like all efficient systems, the Pay-Roll Savings Plan is amazingly easy to install, whether your employees number three or ten thousand.

GPO 16—26944-1 Form No. DSS-280

In a recent agreement between the United States and Brazil, 10 minerals, including rock crystals, rutile, ferronickel, zirconium, bauxite, chromite, and beryl ores were considered strategic or critical materials. The United States will buy all of Brazil's output of these minerals for 1942 and 1943. Any surplus after purchases made by regular American importers will be bought by the U. S. Government through the Metals Reserve Corporation.

Although in World War I new factories were put in operation, the trend was quite different from that in World War II. During the last war every kind of industry producing goods was established, while in the present conflict preference is being given to creation of basic industries which will probably be a definite influence on both exports and imports. Exports naturally will be improved by the demand for the new Brazilian-made products in other South and Central American Republics. Imports will also be affected since a large number of imported goods will be replaced by those manufactured locally.

New Uses for Vegetable Oil and Waxes Are Probed

The government has appointed a committee to study a proposition presented by the state of Maranhão regarding babassú oil. Several experiments have been carried out in that state for using babassú oil as a fuel in Diesel motors, and the results were completely satisfactory. The committee is studying technical features of the proposition presented to the government through the Federal Council for Foreign Trade.

To intensify production of ouricurí or licurí wax, as it is better known in Brazil, President Vargas has approved a decision of the Federal Council for Foreign Trade derogating the privilege for exploitation and refining of such wax. This decision will permit a large amount of business in this wax, presented to Brazil owing mainly to the quality and fair prices of the new substitute for carnauba wax. Starting to appear in exports statistics with only 3,075 kg. in 1937, licurí or ouricurí wax contributed with more than 1,341 metric tons during the first eight months of 1941. Exports during 1941 were made to the United States, Great Britain, Union of South Africa, Argentina, Chile, Colombia, Peru, Canada, Uruguay, and Australia. The average price was about $708.40 per metric tons, f. o. b. Brazil port, against $1,271.10 for carnauba wax. Exports of carnauba wax during the first nine months of 1941 were 8,557 metric tons against 6,202 metric tons during the same period of 1940.

President Vargas has signed a decree prohibiting the cutting down of cashew trees except with special permission (see CHEM. ENG. NEWS, January 10, page 45). This law was established to intensify and encourage production of the valuable oil obtained from the nut. A commission of American technicians is being awaited in Brazil to survey the northern region, paying special attention to development of oil-bearing fruits and plants and to the recommendation of new uses for Brazilian vegetable oils and waxes.

South America Schedules Several Scientific Meetings

The Fourth South American Chemical Congress was postponed to September of this year because of present world conditions. The Brazilian Chemical Society is planning to promote a South American meeting to discuss problems related to the sugar industry, alcohol motor fuels, and standard methods for sugar analysis.

During the current year the Argentine Chemical Association will complete 30 years of existence, and another scientific meeting is being planned for that time.

Imports of Cement for Defense Program Started

As previously mentioned in Brazilian letters, the country several years ago

A Laboratory Mill
for Product Development

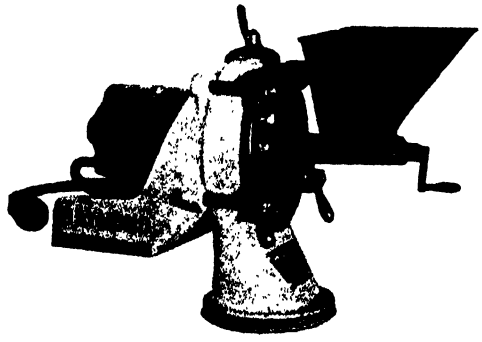
THE RAYMOND Laboratory Mill is designed to meet the requirements of the busy "Lab" man, doing experimental work in the development of new products, or the production control engineer in industrial plants for checking tests on the day's run of finished materials.

This compact unit is built on the same principle and to the same standards that have typified the Raymond line of pulverizing and separating machinery for half a century . . . therefore it produces the

***Same character of finished* material as the large commercial mills**

It can be easily taken apart for cleaning or changing screens

Adaptable for grinding batches of dry materials, from a few ounces to several pounds at a time



Available with hand-operated feeder as shown, or with motor-driven feeder, incorporating variable speed control.

Furnished with a set of screens of various size perforations for controlling the fineness.

We also build a 12-Inch Screen Mill for semi-commercial use, and a line of larger Screen Mills for industrial production.

RAYMOND

RAYMOND Laboratory Mill with direct motor drive

stopped the importation of common portland cement because of the steady increase in local production. Since the outbreak of war, the local plants have been unable to fill the ever increasing demand for the defense program. As a result, the federal government is permitting importation of foreign products, and several cargoes were received recently.

Garampara Oil from Maranhão Analyzed

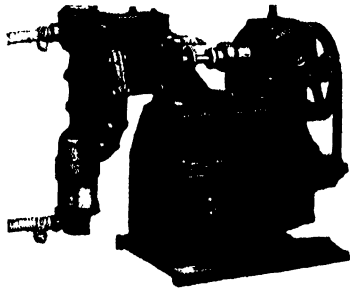
Several tests were recently made in Rio de Janeiro with samples of garampara oil, produced in Maranhão. The analysis showed an iodine value of 98 and a saponification number corresponding to 187. About 37 per cent of oil was obtained from the nut.

Two Plants to Manufacture Window Glass Are Being Built

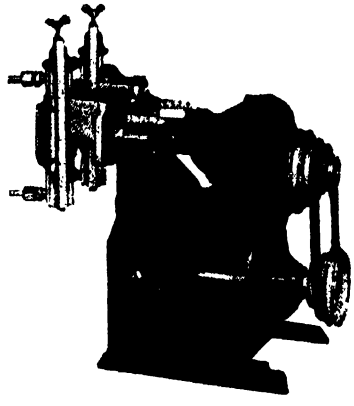
The press reports that construction of the first plant for sheet glass was started in November 1941 at São Gonçalo, near the city of Niterói, state of Rio de Janeiro. The plant belongs to the Companhia Vidreira do Brasil, a concern recently incorporated under Brazilian laws, the principal partners being associated with several Portuguese firms interested in the wholesale market of glass goods. The Companhia Vidraria Santa Marina, established for a long time in São Paulo, has announced that machinery for the production of window glass has already been ordered in the United States for a new factory to be built during the current year.

Graphite Deposits in Brazil Being Developed

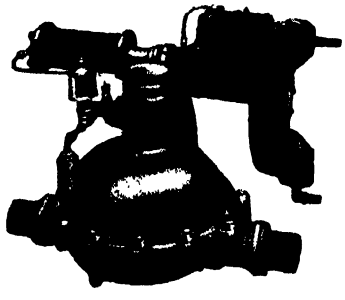
Under present circumstances graphite will probably be incorporated in the agreement signed with the United States to prevent exportation of certain strategic and critical raw materials to other countries than the United States. Several mines are being developed in Brazil, and the product has as good characteristics as that previously imported from England. A high quality of graphite is found in the mines located in the north of the country. In Minas Geraes there are several deposits having a carbon content which varies from 50 to 85 per cent, usually associated with monazite, zircon, and ilmenite. The graphite of São Fidelis, in the state of Rio, contains about 83 per cent carbon. Recently extensive deposits were located in the Formosa District which is on the Goiás and Minas Geraes borders. Deposits of good graphite with a carbon content varying from 80 to 85 per cent exist in the states of Ceará and Santa Catarina. In the state of São Paulo there are two installations for treating graphite, the first located in Pindamonhangaba where the first flotation plant was installed in Brazil and the second in the region of Apiaí. Production during 1941 was estimated at more than 180 metric tons, enough to cover the local requirements.



Additional New Plants Established Recently



In the drive for self-sufficiency, new plants were recently established. The *Revista da Chimica Industrial* in the December 1941 issue reported the opening of the following factories: vegetable oils refinery in Pará; orange juice and essential oils from citrus fruits in Rio de Janeiro; caroá textiles in Paraíba; soap and candles in Baía; and cottonseed oil, matches, starch, and cotton weaving in São Paulo. Enlargement of several factories were also reported by the daily press.



Magnesite Deposits in Baía to Be Developed

A firm known as Magnesita S.A. was organized a few months ago to exploit deposits of magnesite in the south of the state of Baía. The proved reserves were estimated at about 40,000,000 metric

Precise YET Flexible FEEDING OF ALL CHEMICAL SOLUTIONS

For such solutions as concentrated mineral acids, concentrated organic acids, concentrated alkalis and solvents, the Wilson Pulsafeeder TYPE DES-S, operates at a predetermined manually set rate of flow — with an accuracy within 1/10 of 1%. Constructed of whatever material is best adapted for the job — cast iron, stainless, monel or other alloys or glass — the TYPE DES-S assures complete isolation of the solution being pumped from all operating parts.

■

For handling two different chemical solutions at any set ratio up to 100 to 1, the *duplex* Pulsafeeder TYPE DED-A combines maximum efficiency and economy. Both the ratio and the individual feed of the pump are *readily adjustable.*

■

For feeding proportionate amounts of two different chemical solutions by liquid meter control — on ratios as high as 10,000 to 1 — the Pulsafeeder TYPE MC-DS-S may be operated by either air, water or steam. This proportioner is well adapted to handling as the major flow any solution that can be measured by a standard liquid meter.

tons. The government recently authorized the railway crossing the state of Baía to study the possibility of extending the rails to the deposits. It was also reported that a national banking organization, the Banco de Minas Geraes, will finance the exploitation. No analysis of this mineral has been revealed, but statements published by the owners of the deposits say that the magnesite from the Brumado region (state of Baía) will be used not only as a refractory material in the metallurgical industry, but also for the production of metallic magnesium. Minor occurrences of this mineral exist also in the states of Goiás and Rio Grande do Sul.

Timbó and Pyrethrum Production Increasing

Industrialization of timbó and pyrethrum in Brazil was initiated only a few years ago. Timbó is a native plant in Brazil and produces, besides other minor constituents, the rotenone used for insecticide preparations. In 1935 exports of timbó roots amounted to 245 metric tons and, after the decision of the government prohibiting the exportation of roots, foreign buyers started to purchase the timbó powder, which in 1941 amounted to more than 500 metric tons. Total production of timbó powder in 1941 was estimated at approximately 750 metric tons, the state of Pará being the main producer.

Cultivation of pyrethrum in Brazil is relatively recent. The first plantations started to produce in 1936, and the 1941 crop amounted to more than 800 metric tons. The local consumption of pyrethrum flowers is estimated at about 100 metric tons, the balance being exported—to the United States, Germany, and Great Britain in 1940. Users of pyrethrum flowers in the United States are giving preference to the Brazilian product due to the high percentage of pirethrius contents. Because of present world conditions, exports of pyrethrum flowers from Brazil will probably replace those from other producer countries.

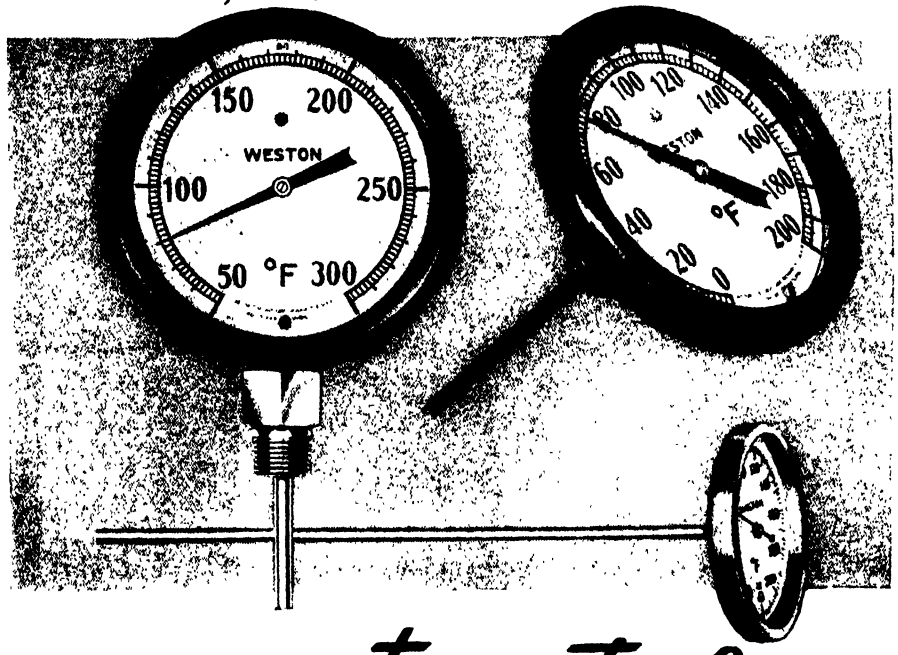
Gains in Exports of Essential Oils Expected

The first exports to the United States of essential oils, mainly citrus fruit essences, did not meet with the standard types required by American consumers, and the shipments were reduced up to the beginning of 1941. Because of this situation some modern plants for essential citrus oils were built, and some others will go into production during the current year.

The products now in the market meet the vigorous standards established by American users, and exports during 1941 amounted to about 90,000 kg. against 13,400 kg. in 1940 and only 5,234 kg. in 1939. Exports during the current year, it is estimated, will be around 200 metric tons when the new factories go into operation.

C. E. Nabuco de Araujo, Jr.

Caixa Postal 970
Rio de Janeiro
January and February, 1942



The British Government has established controls over saccharin and dulcin (*p*-phenetylcarbamide) respecting strength and wholesale and retail prices. Manufacture of solutions except for pharmaceutical use is barred.

Cuban Sulfur Market Dominated by U. S.

American exporters dominate the Cuban market for sulfur, in which imports from the United States represent more than 99 per cent. For 1940 these were 183 tons, compared to 48 in 1939.

In July of last year considerable interest was reported in a supposed sulfur deposit in Pinar del Rio Province of Cuba, which various experts have said is a natural formation with about 500 tons of visible sulfur. Extractions at a rate of about 15 tons weekly have taken place since.

RUGGED ALL-METAL CONSTRUCTION CUTS BREAKAGE COSTS!

WESTON ALL-METAL temperature Gauges

Today it takes real ruggedness to withstand the mechanical abuse around the active plant. That's one of the reasons why more and more plants are installing WESTON Temperature Gauges. Their all-metal construction eliminates much of the common breakage, thus safeguarding against frequent interruptions and replacement costs. In addition to ruggedness, however, WESTON all-metal Temperature Gauges also provide the advantages of *pointer reading*. Their large, dial-type scales can be read accurately from a distance, and they can be mounted at any angle most convenient for easy reading. Available in types, sizes, stem lengths and ranges for most industrial applications. Accuracy guaranteed within 1% for the industrial types . . . ½ of 1% for the laboratory type. The coupon below will bring complete information.

Weston Electrical Instrument Corporation
660 Frelinghuysen Ave., Newark, N. J.
Please send complete literature on WESTON Temperature Gauges.

Handbook of Chemistry and Physics. *Charles D. Hodgman*, Editor-in-chief. 25th ed. 2503 pages. Chemical Rubber Publishing Co., 1900 West 112th St., Cleveland, Ohio, July 1941. Price, $3.50.

THE policy of change and addition, followed by the editorial board of the Handbook of Chemistry and Physics in bringing each succeeding volume up to date, has been continued successfully in the latest edition, the 25th. Aside from the new and completely revised material, a great number of minor changes were made. A table of natural secants and cosecants has been added to the mathematical section, and tables for the conversion of the millibar (newly standardized by the U. S. Weather Bureau) to inches and centimeters of mercury are newly acquired.

Complete revision of the amino acid properties section, photographic data section, isotope table, and vitamin material are noted. Revised to meet specifications of the American Association of Physics Teachers is the table of symbols and abbreviations.

Organic Syntheses. Collective Vol. I. *Henry Gilman* and *A. H. Blatt.* 2nd ed. ix + 580 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1941. Price, $6.00.

IN REVIEWING this volume it is difficult to refrain from superlatives. This collection of carefully selected and thoroughly tested synthetic methods for more than 250 organic compounds has proved of great value in both industrial and academic laboratories. The directions are given with such lucidity and detail that relatively inexperienced chemists can prepare a wide variety of important organic compounds expeditiously and with satisfactory yields. The availability of tested methods for the preparation of a broad range of key organic compounds has been and will continue to be a potent factor in facilitating the prosecution of the major objectives in many organic researches. Every research worker knows how time consuming the synthesis and purification of incidental materials can be before the real problem is initiated.

The plan of the first edition has been followed quite closely with necessary corrections and the additions of new or improved procedures. The inclusion of information as to the commercial availability of certain organic compounds will be of value to many and is a practice which should be carefully followed in subsequent volumes.

The general format including the typography, presswork, paper, and binding are excellent. The editors and contributors have done a painstaking and excellent job, and to them organic chemists should be deeply grateful.

H. A. LUBS

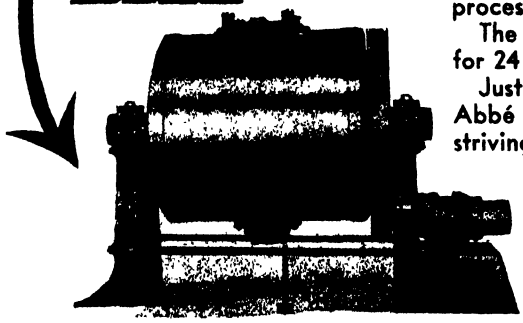
Resins, Rubbers, Plastics. A looseleaf abstract service. Vol. 1, No. 1. Edited by *H. Mark* and *E. S. Proskauer.* 33 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y. Price, $35 per year.

THIS new abstract service, announced last year, now appears as a first monthly section of 33 pages, including a general index and 16 abstracts of papers. The editors announce that they expect to supply some 500 to 600 pages during the year. Thus the present offering may be considered a 6 per cent sample.

The table of contents is an index of the whole subject matter expected to be covered. It is arranged on a decimal system with eight principal headings to cover the General Part and four principal headings, designated alphabetically, comprising the Special Part. In the first group are Physical and Chemical Properties; Physical and Chemical Methods and Testing; Chemical Statics and Kinetics; Manufacture; Molding and Vulcanisation; Finishing of Products; Applications; and Physiology. The Special Part is subdivided into Resins (natural and synthetic), Plastics; Rubber (natural and synthetic); Fibers and Paper (laminates); and Asphalts, Tar Products, Pits (evidently a misprint for pitch).

A BLACKBOARD . . .
YOUR LABOR
IN GRINDING AND MIXING

Paul O. Abbé mills require no labor during grinding and mixing. Just load the mill and jot down the time to shut it off.



The first worker passing the mill at stopping time turns off the switch.

Unload the mill. Reload, and repeat the process . . .

The mill will produce at top speed for 24 hours week in and week out.

Just another advantage of Paul O. Abbé mills that appeals to plants striving for ever increased production in the face of labor shortages and lengthened working hours.

If greater output is YOUR problem, write today for our Free 54 page Data Book.

PAUL O. ABBÉ INC

249 Center Ave. Little Falls, New Jersey

BALL & PEBBLE MILLS • CUTTERS • GRANULATORS • PULVERIZERS • MIXERS

The abstracts appear to be well done. Much more data are included than in the usual abstracts, and graphs and tables are introduced to increase their value. The text is reproduced by the photo-offset process from a typewritten original. Naturally no abstract can meet every demand, but this reviewer's guess is that these will supply most needs.

Perhaps it is unfair to criticize the narrow selection of sources represented by this first sample. But one is struck by the fact that only six publications supply these 16 abstracts. Nine are from A. C. S. publications—*Journal of the American Chemical Society* and *Industrial and Engineering Chemistry* (*Industrial* and *Analytical Editions*). Other publications represented are *India Rubber World* (four abstracts of two papers), *Journal of the American Dental Association* (two), and *Rayon Textile Monthly* (one). All articles abstracted appeared in January issues. One wonders what has happened to all the others of the 86 publications listed in the prospectus.

The carefully worked out system for filing the abstracts in a looseleaf binder (price, $3.00), according to the index numbers printed on each sheet, makes the material easily available for ready reference. Furthermore, the plan provides for several abstracts of a single article from different points of view as shown by three abstracts of one paper in the present group.

A start has been made with the new service, certainly, and the development of the idea will be watched with interest. Its value is not proved by the present offering.

Chemical Solutions. *Frank Welchers.* 1st ed. 408 pages, cloth, 6 × 9. D. Van Nostrand Co., 250 Fourth Ave., New York, N. Y., 1942. Price, $4.75.

This volume is composed of concise accounts of the use, method of preparation, and procedure by which some 1,700 solutions, reagents, indicators, culture media, stains, etc., are applied in laboratory practice. They are arranged alphabetically in accordance with the name of the person by which each is known or the name of its active constituent. Supplementary information is given, where needed, in regard to the sensitiveness of the reactions, interfering substances, keeping qualities, etc. Finally references are included to some 35 books and 98 scientific periodicals from which the compiled information was gathered.

The index is to the substances for the identification of which the solutions and reagents are used. It shows, for example, 60 different reagents for alkaloids, 45 for albumin, 32 for blood, and 35 for glucose. Listed also are 162 stains, 116 culture media, and 41 etching solutions. Thus in many cases there would seem to be an embarrassment of choice. No aid, however, is given, since a critical appraisal of the relative advantages of the many reagents would have led the author far beyond the purpose of bringing together for convenient reference the widely scattered information in this field of laboratory technique. This alone has been a contribution worthy of the appreciation of laboratory workers in many branches of research.

The typography, printing, paper, and binding are of a high standard of excellence and the book will undoubtedly serve a useful purpose in conveniently supplying needful information to large numbers of those engaged in experimental investigations.

Atherton Seidell

Fuel Flue Gases. *Chemical Committee, Technical Section, American Gas Association.* 1st ed. 198 pages. American Gas Association, 420 Lexington Ave., New York, N. Y., 1941. Price, $1.25 to students; $2.25 to A. G. A. members; $3.50 to nonmembers; discounts for quantity purchases.

One of the functions of the American Gas Association is to publish books on various technical phases of the business of manufacturing and distributing industrial fuel gases. Among the more notable examples, from the chemist's standpoint, are Gas Chemists' Handbook, the last edition of which was published in 1929, and "Combustion", published in 1932. "Fuel Flue Gases" overlaps these two in some respects, but in general is sufficiently distinctive to warrant recommendation to the gas chemist and engineer.

The introduction, discussing the kinetic molecular theory and the gas laws, is not well written. A popular rather than a scientific style is employed in some sections; the organization of material is erratic.

The first five chapters—complete fuel gas analysis, physical tests, applications of gas analyses, inert gas safety, and specific constituents of fuel gases—cover the determination and practical utilization of all the chemical and physical tests that can readily be applied to gases. Although analytical details are not discussed, a critical examination of the various pieces of analytical equipment offered for sale is valuable. Applications of gas analyses include combustion calculations, dissociation, calculation of flame temperature, heating value, purging, inflammability limits, and explosive pressures. The interchangeability of gases for domestic appliances and suitability of gases for carburizing are items of interest.

During the past decade, technical ses-

SAFE MIXING

PNEUMIX
Air - Motored
AGITATORS

Pneumix Agitators, powered by air motors, eliminate fire and explosion hazards . . . They are spark-proof, splash-proof — can't over-heat or burn out.

Stirring saponified nitroglycerine, agitating TNT to cool it, mixing varnish, lacquer, cosmetics, dairy products, pharmaceuticals — these are only a few of the difficult mixing jobs that Pneumix Agitators are doing. Variable speeds, 30 to 6000 R.P.M. Batch capacities up to 150 gallons.

Send for Bulletin IE-100

ECLIPSE AIR BRUSH COMPANY, INC.
375 PARK AVENUE, NEWARK, N. J.

sions of the American Gas Association have been devoted more to discussions of the so-called gum problem than any other single subject. In that period the problem has arisen, been investigated by many workers, and solved in a fairly satisfactory manner. The chapter on deposits in distribution systems is an excellent summary of this important and recent development in manufactured gas distribution technology.

The last three chapters cover atmospheres other than those from combustion, furnace atmospheres, and flue gas analysis.

E. H. SMOKER

Chromatographic Adsorption Analysis. *Harold H. Strain.* 222 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y., 1942. Price, $3.75.

THIS book is recommended as a reference on chromatography. It presents a résumé of the work carried out to date in this field and a complete bibliography with subject titles.

Correlations between the adsorbability of organic molecules and the polarity of their substituted groups are discussed. Generalizations concerning the chemical structure and adsorbability of molecules of a similar class were noted. Recommended materials for adsorption colors are listed, although for any particularly new problem which arises trial and error methods must be used to effect the best conditions for separating the mixture. A few generalizations are given on the selection of a solvent for the product to be chromatographed and on the properties of the solvent necessary for the successful removal of the separated products from the chromatogram. Chromatography has been successfully used for the preparation of elements, anions, cations, and isotopes, as well as for the purification of inorganic compounds.

A lengthy chapter reviews the separation of colored and noncolored organic compounds, such as fats, acids, terpenes, sterols, vitamins, hormones, anthocyanins, carotenoids, and coal-tar dyestuffs.

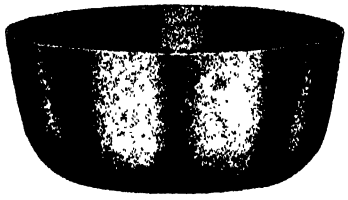
Chromatography is now being applied commercially in different fields, such as water purification, dehydration of natural gas, removal of oil vapor from compressed gases, and removal of color contaminants from liquids used for dry cleaning.

S. S. ROSSANDER

Glass Substitutes for Strategic Materials

IMPENDING and actual shortages of metals, plastics, and other materials have led to more serious consideration of glass as a substitute or alternate. At the suggestion of the Division of Substitute Materials of OPM, now WPB, technicians of the Pittsburgh Plate Glass Co. have prepared a 30-page brochure describing a dozen types of glass, giving availability information together with a suggested list of uses which include those designed to conserve strategic materials. This publication is available on request from the company's Technical Development Department, Grant Building, Pittsburgh, Penna.

Domestic Deposits of Strontium Mineral



CELESTITE, a strontium mineral used for making tracer bullets, military flares, and similar pyrotechnics requiring a dazzling red light, is one mineral for which the United States will not have to depend upon foreign sources, the U. S. Bureau of Mines reports. If Axis submarines succeed in cutting off imports from Great Britain, the United States need only turn to its western states and develop known deposits of celestite as follows: California, one deposit of an estimated 600,000 tons and another of 12,000 tons; Arizona, a deposit of 180,000 tons; and Washington, a deposit of 12,000 tons. This total of 804,000 tons of celestite at the 1940 rate of consumption would last 268 years. Strontium has been mined in Texas and Ohio, and is reported to exist in Arkansas, Michigan, New York, Pennsylvania, Utah, and West Virginia.

The United States imports strontium minerals from Europe instead of developing its own western reserves because the cost of shipping the ores from the West to Atlantic seaboard markets heretofore has been prohibitive. England normally can ship a ton of celestite at ballast rates to the United States for $5.90, while it costs $16.40 from California to the Atlantic Coast. Imports of strontium minerals are duty free, and the relatively small peacetime requirements have been a further deterrent to the development of a domestic industry.

The economic background of strontium minerals, mining and preparation, uses, domestic occurrence, imports, and prices are described in detail in Information Circular No. 7200, "Strontium Minerals", by Charles L. Harness, published by the U. S. Bureau of Mines, Washington, D. C.

List of Russian Journals in North America to Be Compiled

THE Science-Technology group of the national Special Libraries Association has undertaken to compile, for the benefit of users of the Russian scientific and technical periodicals, current or otherwise, a complete list as far as possible of the holdings of such periodicals in all the libraries of the United States and Canada, whether personal, institutional, or industrial.

The American Platinum Works

PLATINUM SUGAR ANALYSIS DISH—FIG. 92 OUR CATALOG N17

Owners and librarians in charge of such materials are asked to cooperate by sending a detailed statement of their holdings to Miss Nathalie D. Frank, 512 West 162nd St., New York, N. Y., stating whether the journals can be borrowed on interlibrary loan and whether the library has facilities for photostatting or microfilming.

Forest Products and National Defense

AMERICAN Forest Products Industries, Inc., 1337 Connecticut Ave., Washington, D. C., has prepared an attractive booklet, "Behind the Eagle Stand the Forests", which illustrates the participation of the lumber and timber products industries in the national defense effort. This is a profusely illustrated 40-page booklet that tells both in words and in pictures what the forest industries are doing for the Army, Navy, defense housing, defense industries, and all industry, and shows the wide field of nondefense uses in which timber construction can be used now to relieve the scarcity of other materials needed for fighting tools. It includes a large map of the United States, which presents graphically the location of various types of forest resources.

Subsurface Sampling of Petroleum Discussed

KNOWLEDGE of the exact amount of gas originally in reservoir petroleum permits more efficient utilization of natural gas in oil production and contributes substantially to the wartime resources conservation efforts of the Nation, according to the U. S. Bureau of Mines. The amount is calculated from samples obtained at the bottom of oil wells through a technique developed by the bureau and widely used by many oil companies.

These methods of analyzing physical properties of reservoir oils are described in Bureau of Mines Technical Paper 629, "Collecting and Examining Subsurface Samples of Petroleum", by Peter Grandone and Alton B. Cook. Copies may be obtained from the Government Printing Office, Washington, D. C., for 20 cents each.

Petroleum Research

LONG before the accelerated war production program began, the Petroleum and Natural Gas Division of the U. S. Bureau of Mines had launched its present studies of problems on petroleum and natural gas output with a view toward conservation of resources and more efficient utilization of petroleum. The division's program covered oil and gas development and production research, petroleum chemistry and refining research, pipe line transportation research, special chemical and engineering problems, helium operations, work for other government departments, and visual education. These researches have been summarized in "Biennial Report of the Petroleum and Natural Gas Division, Fiscal Years 1940 and 1941", Report of Investigations 3616, by R. A. Cattell, G. B. Shea, and others. Copies are obtainable from the Bureau of Mines, Washington, D. C.

February Issue of Chemical Reviews

CHEMICAL REVIEWS for February contains the following articles:

T. H. JAMES AND G. KORNFELD. Reduction of Silver Halides and the Mechanism of Photographic Development.

H. L. HALLER, L. D. GOODHUE, AND HOWARD A. JONES. The Constituents of Derris and Other Rotenone-Bearing Plants.

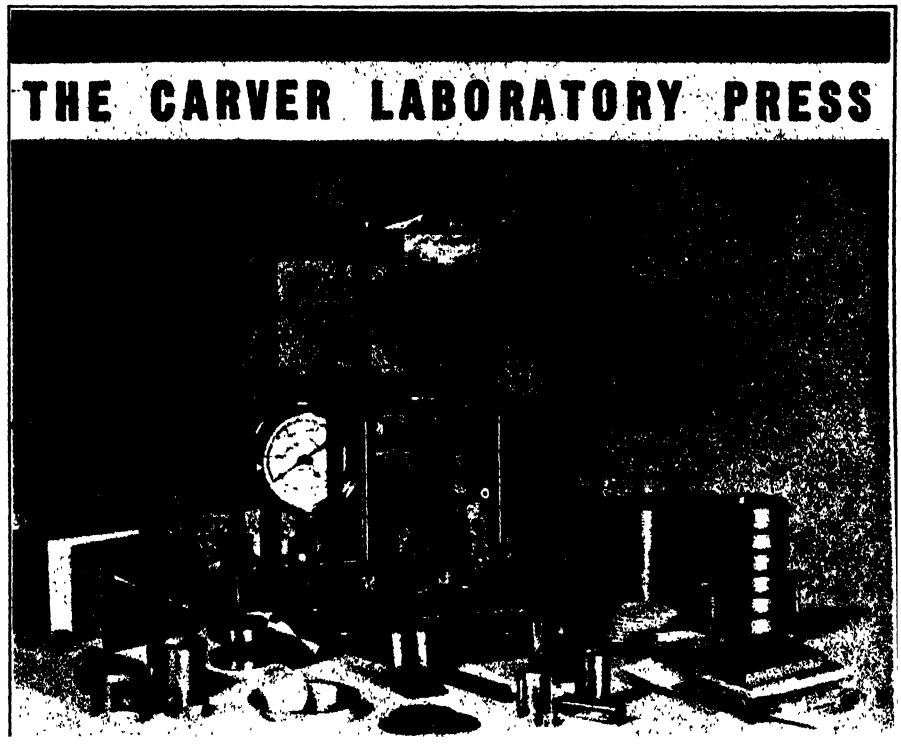
ALICE G. RENFREW AND LEONARD H. CRETCHER. Structure and Antipneumococcic Activity in the Cinchona Series.

R. B. VAN ORDER AND H. G. LINDWALL. Indole.

EDWIN R. LITTMANN AND J. R. M. KLOTZ. Naphthenic Acids. II. Manufacture, Properties, and Uses.

R. H. MANSKE. The Chemistry of Quinolines.

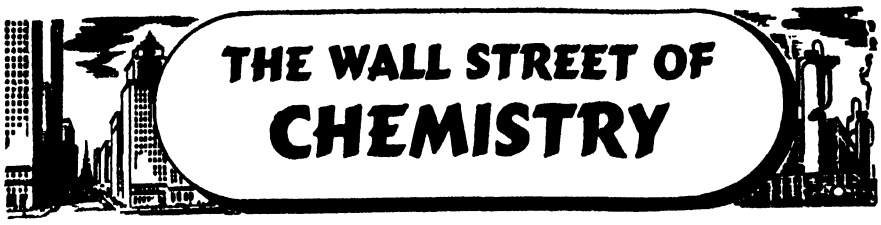
R. H. MANSKE. The Chemistry of Isoquinolines.



Cold Magic

UNDER the title "Cold Magic" the York Ice Machinery Corp., York, Penna., has begun publication of a house organ which it plans to distribute quarterly to all York employees.

The first issue, for Winter 1942 is an attractive 32-page well illustrated volume, which contains articles on "Our Battle of Production", "Recent Developments in Large Ammonia Absorption Systems", and "Our Neighbors to the South", in addition to a considerable number of "Doings in the York Family".



Imports of Natural Dyes to U. S. Maintain Importance

NATURAL vegetable dye materials, the bulk of which are from Jamaica, Dominican Republic, and Ecuador, continue to hold their place in the United States despite the development of synthetic dyes. Such natural dyes and coloring matter as annatto seed or achiote, furnishing extract for coloring butter, cheese, or other foods and dyeing orange yellow on cotton and silk, are used in this connection. Smaller amounts from the Far East, British Malaya, India, and the Netherlands Indies doubtless will be cut off for an indefinite time.

Standard equipment for **research** and small scale experiments in laboratories throughout the world...furnished with accessories, including steam or electric hot plates, cage equipment, bearing plates, test cylinders, filter pads, etc. *Catalog on request.*

Allied Chemical & Dye Corp. total business for 1941 exceeded that of 1940 by about 30 per cent and was the largest in the history of the company. Total taxes increased 121 per cent over 1940 and were equal to $13.67 per share of stock. Regular dividends of $6.00 per share and a special dividend of $2.00 per share were paid. Gross additions to the property account amounted to $21,681,841.

The **Bausch & Lomb Optical Co.** reports sales amounting to $30,562,045 in 1941, the largest in the history of the company, and comparing with $21,858,742 in the previous year. Federal income and excess profits taxes totaled $2,677,959 against $824,013 in 1940.

Sales of the **Celanese Corp.** reached a new high in 1941 at $62,277,141, a gain of 40 per cent over 1940. The company spent $8,700,000 on increased plant facilities. On December 5, 1941, the Celluloid Corp. was acquired as a plastic division of Celanese. The company reports that its new textile fiber, Fortisan, is now being used for parachutes, balloon cloth, and in flare parachutes, and that a new yarn, Lancse, is being used instead of wool.

The **Corn Products Refining Co.** in 1941 handled the greatest volume of business in its history, but may better the output by 10 per cent in 1942. It was necessary to write off foreign assets and accounts receivable and to make a charge to surplus to cover the loss. The total corn grind of 53,500,000 bushels was accomplished by practically continuous operation 24 hours a day, seven days a week, for most of the year.

Fairbanks, Morse & Co. report 1941 net sales of $48,520,959, the largest in the company's history, and net profit the largest since 1925. During the year $447,000 of outstanding 4 per cent debentures were retired. Taxes amounted to $6,834,608 or $11.40 per share, compared with $5.59 per share in 1940. The greater part of the company's manufacturing capacity is now devoted to defense work.

Plants of the **B. F. Goodrich Co.** were operated at a high rate of capacity during 1941, with increasing production being devoted to war purposes. In October the balance of $15,600,000 of a 3 per cent bank loan due in 1945 was paid off, using treasury funds and the proceeds of a new 2.25 per cent $10,000,000 bank loan, maturing serially to 1948. On December 1 an issue of $5,000,000 first mortgage bonds, 3 per cent series, maturing in 1956, was sold at par to an insurance company. Provision for federal income and excess profits taxes amounted to $10,810,000, compared with $2,200,000 for the previous

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

CROLL-REYNOLDS CO.

year. Net sales increased 45.5 per cent over 1940.

The **International Salt Co.** produced in 1941 a volume of salt considerably in excess of that for 1940. Under the indenture provision under which the 12-year 3.25 per cent sinking fund debentures are issued, the company called for redemption at par on December 31, 1941, $100,000 of the issue, leaving $2,900,000 outstanding.

In 1941 the **Monsanto Chemical Co.** paid to employees $3.26 and to the Government $2.18 in taxes for every dollar paid to stockholders. Sales rose 40 per cent to $63,756,221 in 1941, research expenses rose 14 per cent to $1,404,030, and approximately $8,500,000 was spent for improvements and extension of plant facilities. The company increased capacity for production of phthalic anhydride and plasticizers for use in synthetic resins and rubbers, and by the middle of 1942 phenol capacity will be twice that of a year ago. Contact sulfuric acid, chlorine, and aniline plants are under construction.

National Lead Co.'s sales in 1941 were 54 per cent greater than a year ago, but taxes rose from $2,521,531 in 1940 to $10,015,669 in 1941.

United Carbon Co. sales of carbon black and natural gas in 1941 were 34.5 per cent above 1940, a record. Its research department has been working with manufacturers of synthetic rubber on the adaptability of carbon black to synthetic products.

The **Westinghouse Electric & Manufacturing Co.** has set up a special fund to cushion the effect on employees of unemployment incident to the eventual transition from emergency war production to normal production. An amount equal to 0.5 per cent of the pay roll each month will be added to the fund. The pay roll is now more than $15,000,000 per month.

Blackout Candles

A SPECIAL pack of candles for blackout use is announced by Standard Oil Co. of Indiana, Whiting. The white candles, packed in pairs, will burn approximately 9 hours each. They measure 5 inches high and 1.25 inches wide and will stand without the use of a holder. The blackout candles, made in the candle shops of the Standard Oil Co., are also ideal for general emergency use.

Toluene Substitute

NOTOL No. 1 is a hydrocarbon solvent, high in aromatics, which is finding favor in commercial application by industrial users as a toluene substitute. This solvent is produced in accordance with the specifications of United States Patent 2,229,328. Its nitrocellulose tolerance is within 80 per cent that of toluene. It is a product of the Neville Co., Neville Island, Pittsburgh, Penna.

Cement-Asbestos Pipe

ROXITE, a new line of cement-asbestos pipe offered by the United States Stoneware Co., Akron, Ohio, is manufactured by a patented high-pressure process which is said to give the pipe higher density and greater mechanical strength than other cement-asbestos pipe. Patented Flexlock sleeves and fittings are used to couple Roxite pipe and no special tools are necessary for assembling. The method of coupling does away with the need for any special treatment or threading of pipe ends.

Standard Roxite pipe is designed for handling mildly corrosive solutions or fumes and gases in ventilating ducts and stacks, and for transporting processing water which must be kept free of metallic contamination, etc. For more severe duty the pipe is also available with an impregnated or synthetic coating which offers adequate protection for many types of highly corrosive conditions. The standard coating consists of an internal and external synthetic resin finish having a thickness of about $^1/_{64}$ inch. Another protection is Tygon corrosion-resistant lining material, having an effective thickness of about $^1/_8$ inch. This lining thickness offers high resistance to abrasion along with immunity against almost all corrosive chemicals, with exception of glacial acetic, concentrated sulfuric, and chlorinated solvents.

Pinch VALVES
for Abrasive or Corrosive Pulps and Liquids

No metal contacts pulp or liquid

Made with rubber or synthetics, the Maseco-Grigsby Pinch Valve is more resistant to wear than metal valves. Shuts tight even on solid particles... withstands freezing. Useful for solutions which are highly corrosive or which crystallize at normal temperatures and must be handled hot; for solutions or solids which are both corrosive and abrasive. Sizes from 1" to 12". *When writing please state your problem.*

Lard Chiller and Plasticizer. A 16-page illustrated booklet describes complete units for cooling lard under controlled conditions. The lard is crystallized while being agitated rapidly in the first unit. It is then held with mild agitation in a second unit where, due to the heat of crystallization, its temperature rises, and the final tempering or plasticizing is produced. *Improving Lard the Votator Way Booklet CAE.* THE GIRDLER CORP., INC., Louisville, Ky.

Magnetic Separators. A series of magnetic separators utilizing gravity feed, mechanically rotated rougher rolls, and multiple magnetic fields is covered in this 10-page booklet. *Bulletin 701 CAE.* STEARNS MAGNETIC MFG. Co., Milwaukee, Wis.

Manometers. An 8-page bulletin describes a series of industrial manometers. Included are drawings showing various types of installation. *Trimount Bulletin CAE.* TRIMOUNT INSTRUMENT Co., 37 West Van Buren St., Chicago, Ill.

Multistage Centrifugal Pumps. The pumps which are the subject of this 18-page bulletin are available in four to seven stages. Their outstanding feature is that they are hydraulically, dynamically balanced against end thrust. *Bulletin 238 CAE.* PENNSYLVANIA PUMP & COMPRESSOR Co., Easton, Penna

Noise Measurement. Standardized industrial noise instruments are made conveniently with the instrument described in a 4-page illustrated folder. The instrument is completely portable and is nondirectional in its operation. *Folder 448-A CAE.* GENERAL RADIO Co., Cambridge, Mass.

Pumps. A 20-page catalog is devoted to centrifugal, piston, and plunger pumps for services ranging from boiler feed to paper-mill corrosive liquors. *Warren Pumping Machinery Catalog CAE.* WARREN STEAM PUMP Co., INC., Warren, Mass.

Pyrometers. This 6-page bulletin is devoted to suggestions to aid in obtaining the maximum life and efficiency from pyrometric equipment during this wartime emergency. *Defense Bulletin One CAE.* WHEELCO INSTRUMENTS Co., Harrison and Peoria Sts., Chicago, Ill.

Respirators. This single-page folder covers a series of respirators designed to protect against various dusts and vapors. *Folder CAE.* H. S. COVER, South Bend, Ind.

Rotary Compressors. Described in this 16-page bulletin are rotary compressors, dry vacuum pumps, and ammonia gas and sewage gas boosters. These compressors are of the multicellular type, designed for direct coupling to motor or engine. Pressures up to 50-pound gage or vacua up to 90 to 95 per cent of barometer are attainable. *Bulletin 7202* (including *Bulletin 7500*) *CAE.* YEOMANS BROS. Co., 1433 North Dayton St., Chicago, Ill.

Rotary Laboratory Pumps. This 30-page booklet is devoted to vacuum equipment and technique for the laboratory. A series of rotary pumps, a diffusion pump, and such equipment as piping, refrigeration, and vacuum gages are fully discussed. *Welch Duo-Seal Pumps and Vacuum Technique Booklet CAE.* W. M. WELCH SCIENTIFIC Co., 1515 Sedgwick St., Chicago, Ill.

Sealing Solutions for Castings. This 4-page folder describes how porous or leaky metal and alloy pressure castings may be reclaimed by impregnating them with Bakelite sealing solutions. Complete instructions are given for the application of this treatment. *Form 5101A CAE.* BAKELITE CORP., 30 East 42nd St., New York, N. Y.

Slo-Mixers. A 6-page illustrated folder describes paddle-type mixers for use in sewage and water treatment plants, in connection with the Langlier process of multistage flocculation. *Bulletin 389 CAE.* CHAIN BELT Co., 1600 West Bruce St., Milwaukee, Wis.

Steam Distribution Equipment. A 156-page loose-leaf catalog describes such items as expansion joints, conduit, insulation, pipe supports, water heaters, condensation meters, and traps. *Catalog 35 CAE.* AMERICAN DISTRICT STEAM Co., North Tonawanda, N. Y.

Unit Heaters. This 8-page bulletin covers a heater said to incorporate improved air-flow and heat-transfer characteristics. *Catalog AC 574 CAE.* FEEDERS MFG. Co., Buffalo, N. Y.

Water Stills. Single, double, and triple distillation units are described in this 4-page folder. Featured is the vertical condenser mounted directly over the evaporator, which permits ready escape of volatiles and balances the construction. *Bulletin CAE.* AETNA SCIENTIFIC CORP., 236A Broadway, Cambridge, Mass.

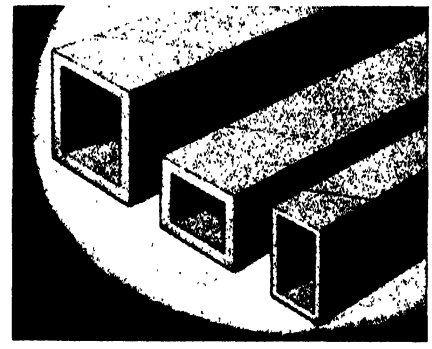
REINHOLD PUBLISHING CORPORATION, 330 W. 42nd Street, New York, N. Y.

Double-Ribbon Mixer

A LARGE double-ribbon type mixer has been completed for an automotive manufacturer by the H. K. Porter Co., 4945 Harrison St., Pittsburgh, Penna. Be-

lieved to be one of the largest of these mixers ever manufactured, it is designed for use in mixing automobile body insulating material. The mixer has a total operating capacity of 2,000 gallons, with a mixing bowl 6 feet wide by 9 feet 2 inches long and 6 feet 6 inches high. The tank, fabricated from plain steel, is driven from both ends by machine cut gears riding on antifriction bearings. Motor drive is mounted on the same base as the machine itself, thus eliminating danger of misalignment.



Fast, efficient mixing is accomplished by means of spiral ribbons arranged to create a positive folding action on the material inside the cylinder. Special end seals prevent contamination of materials being mixed.

Variable Speed Transmission

THE largest variable speed transmission to be equipped with hydraulic automatic control was recently built by Reeves Pulley Co., Columbus, Ind., for use on a rotary veneer lathe in a South Carolina plant. This transmission, weighing 4,300 pounds uncrated, is nearly 9 feet long, 5 feet wide, and stands almost 4 feet high, over-all. It transmits 26 horsepower at maximum speed and provides infinitely variable speeds over a speed ratio of 3:1.

The hydraulic control provides completely automatic speed variation on the transmission. The purpose in this particular installation is to maintain uniformly high peripheral cutting speed on the log from full original diameter down to the smallest diameter at end of the cut. Without this control, speed of rotation of the log would decrease as its diameter decreased, so that much less veneer would be cut toward the end of the run than at the start.

Paper Tubes for Electric Coils

AN IMPROVEMENT in tubes for electric coils is announced by Precision Paper Tube Co., 2033 West Charleston St., Chicago, Ill. Among advantages said to be gained by use of a specially adapted heat die machine are heavy compression, ensuring a new degree of strength and resistance to collapse, finer accuracy in sizing to specifications, superior dielectric properties, and lower moisture absorption rate.

The tubes are preliminarily formed as heretofore of dielectric kraft or fish paper, or a combination of both. The paper is spirally wound on a steel die in an automatic machine. The tube is then pushed pneumatically through the new heated compression die which effects an added compression of about 10 per cent.

Tubes made by this process, supplied in round, oval, square, or rectangular cross section and in continuous lengths of any wall thickness with any inside or outside diameter, can be held to a tolerance of 0.002 inch.

Heat-Transfer Unit for Liquids and Viscous Materials

A HIGHLY efficient, continuous, closed type of heat-transfer mechanism for liquids and viscous materials is manufactured by the Votator Division of The Girdler Corp., Louisville, Ky. Basic features of the unit, known as the Votator, are continuous operation under pressure in a closed system and rapid rate of heat transfer.

The process makes it possible to get extremely high K value, uniform and accurate temperature throughout the product, and accurate temperature control. The high ratio of heat-transfer surface to volume of material permits change in temperature of the product through a wide range in the shortest possible time. The heat transfer is so rapid that many products can be supercooled well below the crystallization point and discharged from the Votator in a liquid state.

Products may be heated or cooled without contacting the atmosphere, due to the fully enclosed design of the unit. Conversely, predetermined amounts of

Chemists and Chemical Engineers Needed in the Production Army

PLANT-LABORATORY-CLASS ROOM

ARE YOU AVAILABLE?

Register in the A. C. S. EMPLOYMENT CLEARING HOUSE
Memphis, Tennessee **April 19–24, 1942**

Open only to members and paid student affiliates of the American Chemical Society registered at the meeting

Advance registration accepted until April 4

Write to the American Chemical Society, 1155–16th Street, N. W., Washington, D. C. if you wish forms sent you by mail.

See CHEMICAL AND ENGINEERING NEWS
January 10, page 36

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

RESEARCH FELLOWSHIPS in Wood chemistry available September 1942 for M.S. candidate. Full time research and study. Stipend $50 per month for nine months. Bachelor degree in chemistry or chemical engineering required. Address applications to Dean D. S. Jeffers, University of Idaho, Moscow, Idaho.

THREE ORGANIC Chemists M.A. degree 1941 or 1942 preferred wanted for organic research developing new uses and products for organic chemical manufacturer. Submit full details concerning education, scholarship, experience, personal data, references, draft status, and recent photo. State salary desired. Address Post Office Box 460, Niagara Falls, N. Y.

PHYSICAL CHEMIST. Eastern A. C. S. approved college with modern well equipped laboratory and library needs instructor for next academic year. Candidate should be less than 28 years old, preferably single, with a Ph.D. from leading university. Instructor will have light teaching load, and plenty of opportunity for research.
Box 103-T-2, Ind. & Eng. Chem., Easton, Pa.

TEACHING FELLOWSHIPS in chemistry, State College of Washington; master's and doctor's programs in organic, inorganic, analytical, physical, and physiological chemistry. One-half time assisting, stipend $450, plus out-of-state tuition.
Box 104-T-2, Ind. & Eng. Chem., Easton, Pa.

WE have POSITIONS for all types of Chemical Engineers and Chemists and would be glad to receive applications from those who are being displaced because they are in non-essential industries, or for any other reason wish to make a change.
Box 26-NP-3, Ind. & Eng. Chem., Easton, Pa.

WE have POSITIONS for women who have majored in Chemistry and would be interested in receiving applications from those who are now graduating or who have received their degrees within the last five years.
Box 27-NP-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. With broad experience in industrial analysis for development of analytical apparatus. In reply give complete details of education, personal history, experience, salary desired, references, and send recent photograph. Location — Western Pennsylvania.
Box 34-NP-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, assistant to plant superintendent in organic chemical manufacturing, principally pharmaceuticals. Location — New Jersey. Age preferred — 30 to 35 yrs., with 10 years' experience in production work. Furnish photograph, complete personal data including draft status, nationality, experience, education, and several references.
Box 42-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer — mechanically inclined with one or two years' industrial experience plant & laboratory control. Metallurgical background desirable. Philadelphia area.
Box 48-NP-3, Ind. & Eng. Chem., Easton, Pa

INORGANIC CHEMIST, for research and development of inorganic heavy chemicals with well-known progressive upstate New York concern. Submit full details of education, experience and complete personal data. Recent photograph desirable.
Box 89-NP-3, Ind. & Eng. Chem., Easton, Pa.

SEVERAL ENGINEERS with chemical, mechanical, or electrical training, and a physicist required at once for expanded development program by well-known group of associated companies manufacturing lumber, plywood, fibrous products and defense materials. Location Middle West or West Coast. Recent graduates, several years' experience, preferred. Submit details, education, experience, references, salary requirement, photograph, draft classification.
Box 57-N-3, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMISTS, Ph.D's., with thorough training in laboratory research methods as well as in the fundamentals of organic or physical chemistry for positions as project leaders in research laboratory of major petroleum company of southwest. Recent graduates preferred. Give personal data and details as to scholastic training, salary expected, and references. Enclose recent photo. Advise if plan to attend Memphis meeting of A. C. S.
Box 86-NP-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, wanted by progressive upstate New York manufacturer. Recent or June graduate with advanced degree in Analytical Chemistry preferred. Submit full details of education, experience and complete personal data. Recent photograph desirable.
Box 90-NP-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, for research work by progressive upstate New York manufacturer. Recent or June Ph.D. preferred. Submit full details of education, experience and complete personal data. Recent photograph desirable.
Box 91-NP-3, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIP available September 1942, stipend $770, yearly. Fee exemption. Full time for research and study. M.S. or equivalent in either physical or analytical chemistry, desired. Send applications to L. P. Biefeld, Dept. of Chemistry, Purdue University, Lafayette, Indiana.

A GRADUATE CHEMIST with five or more years' research or semi-research background, preferably experienced in dry pigments. Applicant must be classified 3A. Give past record in detail and salary desired.
Box 17-TP-3, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST wanted for bakery products control laboratory: Applicant must have college degree in chemistry and several years' experience in general food chemistry. Should have ability to supervise laboratory work and analyse flour, shortening, milk, eggs, and other products used by a bakery. Apply by written application only, giving personal and technical qualifications, experience, draft status, age, references, recent photograph, and salary desired. Application will be treated in strict confidence. The Great Atlantic and Pacific Tea Company, National Bakery Division, 420 Lexington, New York.

ANALYTICAL RESEARCH Chemist, by fast-growing laboratory in Middle West. Must have had experience in meticulous analysis of gaseous fuels. Ph.D. preferred but not essential. Salary open.
Box 30-T-3, Ind. & Eng. Chem., Easton, Pa.

CAPABLE EXECUTIVE to assist in general management and development of successful southern chemical industry.
Box 31-TP-3, Ind. & Eng. Chem., Easton, Pa.

CARBON BLACK Chemist, B.S. degree or equivalent. Good scholastic record and about one year's experience in chemical research on carbon black required. Give education, experience, personal data, and draft status. Starting salary $1800-$2400 per year.
Box 37-T-3, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT CHEMIST in Brewery. Recent graduate. Applicants should give age, educational background, experience, if any, salary expected and recent photograph. Location, Western New York.
Box 39-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Applicants should give educational history, scholastic grades, experience, age and other personal data, and recent photo. Good opportunity for well-qualified person.
Box 46-TP-3, Ind. & Eng. Chem., Easton, Pa.

HEAT EXCHANGER engineer to be assistant manager of heat transfer division of Pennsylvania Manufacturer. Opening is permanent, immediate, excellent opportunity for advancement. Chemical engineering degree preferable, mechanical engineer suitable. Experience designing heat exchangers necessary but will consider application from recent graduate specially trained in heat transfer. Salary commensurate with ability
Box 49-TP-3, Ind. & Eng. Chem., Easton, Pa.

CEREAL CHEMIST. Master or Ph.D. Please furnish details of educational and personal history, references and recent photo. Opportunity for qualified person in research laboratory of prominent food organization.
Box 55-TP-3, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED MAN or woman, analytical chemist for pharmaceuticals. Broad organic background essential. Large concern, Northern New Jersey. State full qualifications and salary expected. Include recent photograph. Our employees are aware of this advertisement.
Box 56-TP-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST in food research laboratory. Good training in fundamentals of chemistry required. Give details of educational history and experience, age, and other personal data, and small photo.
Box 60-TP-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for Research and Development Department of established heavy chemical and metallurgical plant in southeast. Desire well qualified man with five to ten years' research and industrial experience, preferably in metallurgical and inorganic chemical work, for permanent position. Give particulars of training, scholastic ranking, experience, salary expected, personal data and photo in first letter.
Box 77-T-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST. Master or Ph.D. Submit educational history, personal data and small snapshot. Opening offers opportunity for qualified person in food organization research laboratory.
Box 85-TP-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Bachelor or Master. Applicant should submit educational history, experience, age and small snapshot. Good opportunity for qualified person.
Box 86-TP-3, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, in food industry. Applicant should have broad training in the fundamentals of chemistry and chemical engineering, and some experience in food technology. Submit details of educational and personal history, and recent snapshot. Excellent opportunity for qualified person.
Box 87-TP-3, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 434)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised—or in regard to those seeking employment.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

COLLEGE TEACHING or Research, Ph.D., 1931, with teaching experience in general, organic, physical chemistry, research work in colloids, publications, Protestant, midwest preferred, age 37, American, draft deferred.
Box 40-N-2, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN Chemist. Five years' experience in technical research on synthetic coatings and adhesives. Also experienced in photochemistry. I have shown originality; and I have obtained practical results. Married. Age, 28. Harvard training. Now employed, seeking better opportunity.
Box 68-N-2, Ind. & Eng. Chem., Easton, Pa.

RESPONSIBLE TEACHING, research or development position desired by Chemical Engineer Ph.D. 1934. 6 years' industrial research, development and control experience (inorganic heavy chemicals). 6 years' teaching. Patents. Present research on waste gas recovery and industrial utilization of agricultural by-products Age 35. Married.
Box 37-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., with Ph.D. in agricultural biochemistry. Graduate training includes work in chemical engineering, organic chemistry, biochemistry, and bacteriology. Five years' experience in food industry. Sigma Xi, Phi Lambda Upsilon. Desires position in the Middle or Far West.
Box 43-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: will complete work for Ph.D. 1942. Major inorganic and analytical. Good training in organic. Desire position doing research. Preferably New York City or vicinity. 18 years' practical experience. Publications. Available immediately.
Box 61-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1928, minor physics, 13 years' experience synthesis, aliphatic, aromatic, heterocyclic compounds, also enzymes, vitamins, coal tar products and plasticisers; familiar with physico-chemical methods. Want responsible position in organic research, preferably with biochemical applications. North or South America.
Box 65-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.A., sixteen years' experience in research, production, and control especially in foods, bacteriology, and biochemistry. A good plant manager and superintendent; successful research and sales experience. Can get things done and usually make money for employers. Age 39, married, Protestant.
Box 92-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.Ch.E., 1940, Tau Beta Pi. Single, 23, 3A draft. Two years' experience development synthetic resins and plastics, mainly laminated phenolics. Desire any position in plastics industry. Metropolitan area preferred, but will consider anywhere. Available immediately.
Box 100-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942. Available immediately. Research experience in organic syntheses and enzyme chemistry. Interested in organic, biochemical or drug research. Age 24, single, draft deferred. East preferred. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi.
Box 102-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., with some engineering training, age 35, married, Protestant, Anglo Saxon, 10 years' research experience, naval stores, terpenes, resin acids, olefin polymerisation and hydration, catalytic vapor phase oxidation. Wishes position teaching, research, development, plant operation.
Box 33-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 27, married, now teaching in a large N. Y. college. Desires part-time work in synthetic organic research and for full-time summer employment in N. Y. C. area. Excellent training and experience. Particular desire to assist in war effort.
Box 38-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S. 1941, M.I.T., over 100 semester hours chemistry. 6 months' experience plastics research. Now employed. Desire position with greater opportunity. Research, development, or production. Available on short notice. Prefer Middle Atlantic or Middle West. Age 22, single, Class 1B. Excellent references.
Box 40-N-3, Ind. & Eng. Chem., Easton, Pa.

INORGANIC and PHYSICAL Ph.D. desires position with more promising future. 3 years' experience at A.C.S. accredited colleges teaching qualitative, quantitative and general chemistry. Research publications. Age 27, Protestant, married. Available in late May for academic or industrial position.
Box 51-N-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A. 1941 from leading A.C.S. approved university. Age 24, single, good health. Thorough training in all branches of chemistry. Prefer far West, but available anywhere immediately. Mechanically inclined. Desire research or development position. Hope to attend Memphis meeting.
Box 53-N-3, Ind. & Eng. Chem., Easton, Pa.

PRIVATE RESEARCH assistant in large Eastern university. Organic chemist, Ph.D. 1941. Undergraduate major — Bio-chemistry. Research on amines, amino acids, unsaturation, organic synthesis. Publications. Graduate assistant in organic 4 yrs. Desire research or teaching position. Draft deferred, 27, single, available immediately.
Box 54-N-3, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED REFINER of corn starch, corn syrup and by-products, seeks position as director of research, chief chemist, assistant shift superintendent or general superintendent.
Box 60-N-3, Ind. & Eng. Chem., Easton, Pa.

PLANT MANAGER or Superintendent. Accustomed full responsibility. Chemist and chemical engineer. Plant design, pilot, layout, development; operation, maintenance, production planning, costs, chemical economics, personnel and sales relations. Synthetics, solvents, plastics, extracts, oils, alkaloids. Distillation (including vacuum), alcohol recovery. Age forty, married, American ancestry, Protestant, consulting experience, patents, publications, references. Available short notice. Reasonable salary.
Box 65-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1939. Desires research position in the middle-west, in the field of synthetic organic chemistry. Resin experience. Presently employed, available within reasonable time. Draft deferred. Single.
Box 68-N-3, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1928, with ten years' experience in teaching general, inorganic, analytical chemistry. Publications. Abstractor for the encyclopedia of chemical reactions. First rate references. Age 37, single. Ex-Austrian. Employed. Available within reasonable notice. Location immaterial.
Box 69-N-3, Ind. & Eng. Chem., Easton, Pa.

ENGINEER with exceptional training and ability. Degrees in chemical and industrial engineering leading universities. Successful record in research and development on plastics, cellulose paper, lignin, extraction and engineering economics; would prefer production. Fluent French, Spanish. Single, 24, draft deferred, immediately available.
Box 11-T-3, Ind. & Eng. Chem., Easton, Pa.

KNOWN INDUSTRIAL Biologist, for many years active in the food and fermentation industries in his former research laboratories. Wishes to contact progressive concern which is interested in the development of new products and the utilization of by-products. The connection should be consultant and advisory based upon mutual understanding.
Box 12-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1940 research in Friedel-Crafts alkylation. Thesis and publications. Sigma Xi and Phi Lambda Upsilon. Research experience in petroleum chemistry, manufacture medicinal white oil and petroleum sulfonates. Employed, draft deferred.
Box 15-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1941 A.C.S. accredited midwestern college. Training in organic, inorganic, analytical, and bacteriology. Industrial experience in analytical and food processing. Patent. Desires National Defense Work. Age 27, single, dependents. Employed. Available reasonable notice.
Box 16-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Univ. of Penna. (1939). Organic major, physical minor. Over two years' research experience in organic synthesis. 24, single, draft deferred. New York City area preferred. Available at short notice.
Box 18-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Experienced in industrial research and organic synthesis. Also thorough and practical background in analytical and physical chemistry. Honor societies. Publication. Now profitably employed but seeking responsible position which offers greater opportunity for advancement.
Box 19-T-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., 1937. College teaching, general, physical, organic, analytical. Varied research: inorganic, electrochemistry, catalysts, polarograph. Expert glassblower. Sigma XI. Age 30, married. Industrial research position desired in East.
Box 21-T-3, Ind. & Eng. Chem., Easton, Pa.

TEACHING, INDUSTRY, Ph.D. in Physical and Inorganic. Broad analytical training and experience. Several years' college teaching General and Analytical. Sigma Xi, Phi Lambda Upsilon. Available June. Male, age 30, married.
Box 23-T-3, Ind. & Eng. Chem., Easton, Pa.

PROFESSORSHIP, by Ph.D. Ten years' teaching experience, chiefly general, some physical, organic, analytical. Five years' experience in industrial research laboratory where now employed. Age 36, married, four children, Protestant, honorary societies. South preferred.
Box 24-T-3, Ind. & Eng. Chem., Easton, Pa.

SALES ENGINEER. Graduate in Industrial Chemical Engineering and other university courses. Broad experience in petroleum field including sales management, sales engineering both automotive and industrial fuel oil and its application to processing and power plants, marine shipping, terminal operation both marine and pipe line. Age 42, married. Employed but seeks change. Employer not in defense industry.
Box 27-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and CHEMICAL Engineer, B.S. 1941. Now working toward M.Ch.E. Extensive laboratory training in analytical organic and inorganic. Single, 23, draft deferred. Desires analytical, production, control and research work. New York preferred; will consider anywhere. Available June 1st.
Box 29-T-3, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. from leading university desires research and teaching position. 12 years' experience teaching and directing research. Numerous publications. Have taught organic, colloid, physical and biochemistry. Married. Available immediately.
Box 32-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: 18 years' in plant process control, plant research, supervision, and laboratory supervision. Experience includes 12 years' chemical technology in apparatus field, 4 yrs. development & supervision in carbon and dry cell industry, 2 yrs. in metallurgical field. Wide experience in consulting work in electrochemical, food, and instrument application. Location Midwest or West. Interested in technical sales or production supervision.
Box 33-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.I.T. graduate plus business training with twenty years' diversified experience directing (often as consultant) research and development on products, processes, equipment; cooperating in design and initial operation of million dollar plants; solving production problems; increasing morale and efficiency of men. Recently in pulp and paper; earlier in rubber chemicals, varnishes and heavy coatings, gas and by-products.
Box 34-T-3, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., married, Protestant, six years' research experience. Excellent knowledge of recent developments in biochemical field. Broad training in all branches of chemistry. Numerous publications. Member of several societies. Desires responsible position in research laboratory of progressive food or pharmaceutical concern.
Box 35-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.SC. in Chemistry, May 1942, prefers employment within 100 miles of Philadelphia, but will go anywhere. Scholarship student (I.Q. 150), with summer experience in control laboratory. Basically trained in inorganic, organic, analytical and physical chemistry, also in microanalysis.
Box 38-T-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, B.Sc. May, 1942. Standard training in main divisions of chemistry, including microanalysis and chemistry of foods and drugs. Scholarship student, college laboratory assistant, summer experience in petroleum industry.
Box 40-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S., 1933, desires research position. Thoroughly experienced in the production and assay of pharmaceutical and vitamin preparations. Director of Research Laboratory with 7 years' experience in the development of pharmaceutical, vitamin and food products. 2 years' experience in the manufacture of fine organic chemicals. Married, 3A draft deferred.
Box 42-T-3, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT and RESEARCH chemist with exceptional training and experience. Ability to initiate and direct research problems with sound judgment and resourcefulness. 17 years' highly successful record in heavy chemicals, petroleum, high pressure gases and catalytic processes. Desire responsible position here or in Latin America.
Box 50-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1942 midwest university. Bacteriology minor. General chemical background. Research experience, organometallics, sugars, aminophenols, general synthetic reactions. Interests, organic, drug, or bacteriological research or teaching with research. Age 25, married, draft deferred. Available for interview at Memphis meeting.
Box 51-T-3, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 435)

(Situations Wanted Continued)

DETROIT, TOLEDO, Cleveland. Industrial and research chemist Ph.D. wishes research or administrative position in this area. Ten years' experience resins, plastics, lacquers, cellulose derivatives, cellulose films, wool substitute fibers, paper, waxes. Patent litigation experience. Married. Employed.
Box 53-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Thirteen years' experience in research, development, and production on nitrogen, chlorine, and sulfur compounds, poisonous and volatile gases, and high pressure catalytic synthesis. Expert in training personnel and starting new plants.
Box 54-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., 1934. Six years' industrial research, development, and control work on milk products. Employed but interested in responsible position or good opportunity for advancement. Would prefer research in plastics or synthetic rubber. Midwest location but will consider other work, anywhere. Took 2 year pre-engineering course, also have major in mathematics. Age 31, married.
Box 57-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, research, development. M.A. eastern university 1942. Teaching fellow. B.A. far western university 1938. Two years' experience in mid-west in synthetic resins, coatings, plastics, and related products. Persistent worker. Age 25. Selective service 2-A. Available June.
Box 58-T-3, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST and BACTERIOLOGIST for college teaching and research. Ph.D. 1940. Minor in organic. Two years' post-doctorate experience in enzyme and vitamin research. Three years' consultant to pharmaceutical company. Publications. Presently employed but desires position with opportunity for teaching. Sigma Xi. Age 26. Married. Draft deferred. Available August 1942.
Box 59-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER B.S. Specializing in explosives and ammonium nitrate processing. Experience in paper industry. American, single, Protestant, 2B classification. Location immaterial. Available reasonable notice and salary.
Box 61-T-3, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1940. Now employed desires responsible position with a progressive firm. Experienced in small animal experimentation, vitamin assays and endocrine chemistry. Publications, honor societies. Eastern location preferred.
Box 63-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S., with special training in rubber chemistry and technology. Sound background in physical and analytical chemistry. Taking graduate work. Now working on coal degradation. Desires research position in synthetic rubber development. Age 21, single.
Box 64-T-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL METHODS. Chemist-biochemist. Ph.D. Five years' research and microanalysis of soil, plant and biological materials. Trace metals, vitamins and insecticides. Spectrographic and photometric techniques. Honor societies. 19 publications. Married, age 32. Now employed. Interested in methods research or directional position. Location immaterial.
Box 65-T-3, Ind. & Eng. Chem., Easton, Pa.

THOROUGHLY TRAINED chemist. M.S. Iowa State; B.S., Ph.D. Cornell. Research: plant pigments, vitamins, bioassays, balance studies, feed and food analyses, mineral nutrition. Experience; two years' industrial, one year head of chemistry department small college. Phi Kappa Phi. 26, married. Desires teaching with opportunity for research.
Box 66-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Ph.D. Industrial experience in synthetic medicinal research, hydrogenation. Working knowledge of pharmacology. High scholastic standing, fellowships, college teaching. Patents, publications. Young, married, draft deferred. Desires pharmaceutical research position in East.
Box 67-T-3, Ind. & Eng. Chem., Easton, Pa.

NUTRITIONAL CHEMIST. Assistant Professor of Biological Chemistry in large University desires new position, either academic or industrial. Numerous research publications. Location immaterial. Available immediately.
Box 69-T-3, Ind. & Eng. Chem., Easton, Pa.

PAINT CHEMIST: Twelve years' experience in direction of research, production, development and sales service of paints, resins, varnishes and enamels. B.S. in Chemical Engineering; married. Now employed, desire better opportunity.
Box 72-T-3, Ind. & Eng. Chem., Easton, Pa.

Ph.D., 5 YEARS' research in Sweden on short waves and isotope separation, 2 years' research fluorine chemistry in America, many publications. Austrian. No enemy alien, Christian, single, age 29, first citizenship papers obtained.
Box 73-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Ph.D. Wide experience in theoretical and synthetic organic chemistry. Undergraduate and graduate study, academic and industrial Post-doctorate appointments, and instructorship, at large Eastern University. Phi Beta Kappa, Sigma Xi. Publications, independent research. Employed. Desires industrial or academic position.
Box 76-T-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. M.Sc. 1940 with 1 year of industrial experience desires employment in any of the Defense Industries, in Control or in Production. Also desires position as an Assistant Spectrographer. Eastern location preferable.
Box 78-T-3, Ind. & Eng. Chem., Easton, Pa.

NEW PRODUCT? Could I suggest or work out with you that new product? Biochemist, Ph.D. with industrial plant and laboratory experience in vitamins and vitamin products, nutrition, foods and bioassays. Desires supervision of production or research with progressive company. Married.
Box 79-T-3, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1940. Organic major. Two years' college teaching, general, organic, analytical; two years' graduate assistant. Phi Beta Kappa, Sigma Xi, fellowships, publications. Available September, 1942. Woman, single.
Box 80-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. 1938. Phi Lambda Upsilon, highest honors. Now employed, four years' experience in the petroleum field. Direct charge of research and pilot plant development work on alkylation, isomerization, cracking with a large oil company. Other miscellaneous duties. Desire development or production work. Age 28, married, 3A.
Box 81-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D.; Sigma Xi; wishes part-time literature or laboratory work in New York City area; now employed; own laboratory; synthesis and analysis; prefers small active firm.
Box 82-T-3, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER, eight years' experience in research, development, specification, applications of vinyl type resins and coatings. Interested in plastics or synthetic rubber. B.Ch.E., M.Sc., age 31, married, Protestant, class 3-A, employed non-defense.
Box 85-N-3, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, American Born, wants position as analytical chemist in some industry. B.S. degree in May, 1942. 39 semester hours in chemistry including quantitative, organic and physical. Location immaterial.
Box 10-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S., May 1942; at A.I.Ch.E. approved school. Excellent preparation in organic and physical chemistry. Prefer development work, or position leading to this, in chemistry, particularly organic. Southwestern location desired but not essential.
Box 20-T-3, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, (B.S. '41). Now employed as analytical chemist and bacteriologist in a large, well known food laboratory. Desires a similar position in the South.
Box 25-T-3, Ind. & Eng. Chem., Easton, Pa.

YOUNG INDUSTRIAL Chemist, 5 years' experience in Argentina, in assaying, ceramics casting process research; food, packing house products, gas works, sulphuric acid lead chamber plant and coal tar by-products analysis. Ceramics coal tar distillation and by-products and sulphuric acid control. Unmarried. Fluent Spanish. San Juan 868, 3o, B, Buenos Aires, Argentina.

RESEARCH CHEMIST. Young Ph.D. with several years' industrial experience desires new position. Excellent training. Varied experience. Publications, Phi Beta Kappa, Sigma Xi.
Box 30-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Master, 1940, Christian. Working chemical plant layout and general engineering. Training in development and some production. Desires position with progressive group in process improvement, development or pilot plant work.
Box 44-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST—B.S. Chemical Engineering. Seventeen years' experience. Eight years' charge laboratory, manufacturer of petroleum resins, aromatic solvents used in paint and varnish and insecticide field, synthetic coatings from same, also three years' technical sales. Analysis of iron, steel, nonferrous metals. Married.
Box 45-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, young, B.Ch.E. cum laude; M.S.Ch.E.; experience all phases petroleum refining and research and development; asphalts, road oils, fuel oils. Graduate research product development & agricultural by-product. Will consider any chemical engineering industry. Location immaterial. 1B classification.
Box 52-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., 1937, leading midwestern university. Age 26, married. Three years' experience in organic synthesis. Now employed as research chemist developing syntheses for nicotinic acid. Patents. Eastern location preferred.
Box 68-T-3, Ind. & Eng. Chem., Easton, Pa.

PHYSICIST, Ph.D. Caltech, Sigma Xi. Experience vacuum technique, electrical measurements, photographic industry. Languages, economics. Draft deferred. Citizen Czechoslovakia, First Papers.
Box 83-T-3, Ind. & Eng. Chem., Easton, Pa.

PHENOLIC RESIN chemist seeks responsible position. B.S. degree in organic plus some graduate work. Several years' experience in the plastics and resin field. Successful research on resins for molding, plywood glues, friction materials, abrasives, laminated products, oleoresinous applications as varnishes, enamels, etc. Applicant now employed, a native American, Christian, and married.
Box 84-T-3, Ind. & Eng. Chem., Easton, Pa.

Industrial News

CONTINUED FROM PAGE 432

gas may be incorporated into the product. The unit can be used to make a uniform mixture or to emulsify a mixture of products while the temperature is being changed.

Arrangement of the connections for the product and for the medium permit varied piping hook-ups, so that the mechanism can be incorporated into virtually any flow system. Multiple assemblies may be used for both heating and cooling the product in a few seconds. The company is prepared to produce the mechanism in standard sizes and designs as well as to meet specific requirements.

Conductivity Bridge with Expanded Range

SPECIFIC resistance values up to 2.5 megohms, in six ranges, are covered by the new model RC-1-C conductivity bridge announced by Industrial Instruments, Inc., 156 Culver Ave., Jersey City, N. J. This adaptation of the Wheatstone bridge permits wider application than the previous model covering values up to 250,000 ohms in five ranges.

A six-point switch covers the six resistance ranges. A single dial control provides direct resistance readings in conjunction with the multiplying factor of the range switch. Accuracy, guaranteed within 1 per cent except for extreme ends of calibration, is entirely independent of line-voltage variations. The alternating current bridge with cathode-ray visual null indicator provides for a sturdy instrument. The scale length of about 14 inches, or a total of 84 linear inches of calibration over the six ranges, permits close readings.

Used as a conductivity bridge in connection with the proper cell, this instrument can detect impurities in distilled water of the order of 1 part of chloride ion in 2,000,000 parts of distilled water.

Durez 11863

A PHENOLIC molding compound having a very low power factor (0.07 at 1000 K. C.) and high dielectric breakdown and fatigue has recently been introduced by Durez Plastics & Chemicals, Inc., North Tonawanda, N. Y. This material was especially developed for radio parts as condensers, crystal holders, etc. It has been designated as Durez 11863 and is said to have excellent moldability, being easy to handle in compression molds.

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 266 Fifth Avenue, New York, N. Y.

WANTED: Subcontractor with equipment to carry out Hydrogenations on several products on a profitable custom basis. If you have surplus capacity for this type of operation write at once to Box 36-N-3, Ind. & Eng. Chem., Easton, Pa.

WANTED: up to 50 gals. of diethyl carbinol, 100 lbs. of diethyl ketone, up to 2000 lbs. of capric acid, 5 grams each of ketipinic acid, thienyl mercaptan, methyl furfurol. Quote prices.
Box 13-T-3, Ind. & Eng. Chem., Easton, Pa.

WANTED TO BUY: Pulfrich Refractometer in good condition. Must be suitable for use with liquids of n_D^{25} of 1.3 to 1.6.
Box 43-T-3, Ind. & Eng. Chem., Easton, Pa.

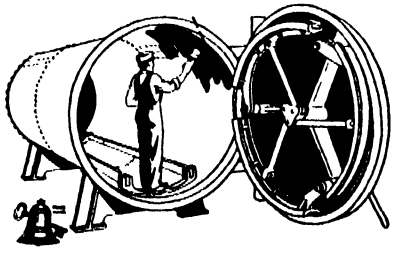
WANTED: First four volumes of Bielstein fourth edition and their supplements. Please state condition and price.
Box 62 T 3, Ind & Eng. Chem., Easton, Pa.

WE OFFER: Allantoin, Benzedrine Base, Calcium levulinate, Cholesterol, Creatine, Cystine, Digitonin, Hydrazine Hydrate, Methonine, Tryptophane. Sugars: Fucose, Dulcitol, Glutathione, Melibiose, (d-Ribose)-Raffinose. Acids: Barbituric, Galacturonic, Glucuronic, Levulinic-Lactic, Maleic Anhydride, Naphthalene acetic.
Box 47-T-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical Abstracts, Vols. 1-27 inclusive, complete with 1st and 2nd Decennial Index, unbound, substantially new condition. Buyer to pay freight or express from Cambridge, Massachusetts. Highest bid received by April 15 will be accepted; minimum acceptable $350. Terms C.O.D. L. H. Littlefield, 12 Oxford Street, Cambridge, Massachusetts.

FOR SALE: Chemical Abstracts volumes 6 35, and 3rd Decennial Index only. Completely bound in green library buckram. Condition excellent. Sold only as a unit. Price $500.
Box 41-T-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Due to dissolution of partnership, an active commercial laboratory business, long successful in highly industrialized area, is for sale complete. Specially equipped for metallurgical and general analysis.
Box 70-T-3, Ind. & Eng. Chem., Easton, Pa.



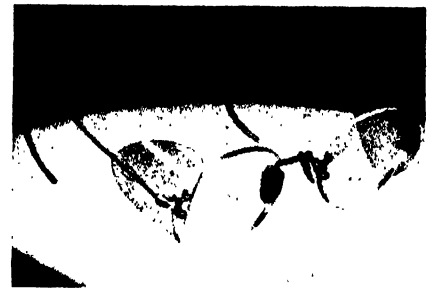
FOR SALE: Rare Metals. Misch metal, Beryllium, Barium, Caesium, Columbium, Gallium, Germanium, Indium, Iron powder Pure 99.99, Lanthanum, Lithium, Manganese 99.90, Potassium, Samarium, Strontium, Vanadium, Yttrium, Uranium, Titanium Carbide, Thorium, Ferrouranium, Ferro Boron.
Box 48-T-3, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: "Berichte Deutsche Chemische Gesellschaft": Vols. 1-59 (1868-1926); "Maly's Jahresberichte Fortschritte der Tierchemie": complete set; "Proceedings Physical Society (England)": Vols. 1-53 (1874-1938); "Quarterly Cumulative Index Medicus": Vols. 1-29 (1927-1941), bound; "Chemical Abstracts": complete set with 3 Decennial Indices, set newly bound in black buckram. A. Calvert, 221 Seaman Ave., New York, N. Y.

FOR SALE: Chemisches Centralblatt 1897 to 1914. Zeitschrift anorganische Chemie vols. 40 to 91. 109 to 138. Zeitschrift analytische Chemie vols. 43 to 120. Beilstein, organische Chemie vols. 1, 2, 3. The Dyer 1933 to 1940. Schultz Farbstofftabellen 7 edition. Wanted: Intern. Critical Tables. Journal praktische Chemie, Berichte Deutsche Chemische Gesellschaft.
Box 74-T-3, Ind. & Eng. Chem., Easton, Pa.

SELLING OUT our Mineral Stock: 100 pounds each: Apatite, Arsenopyrite, Brucite, Beryl, Chalcopyrite, Columbite, Halloysite, Limonite, Olivine, Selenite, Spodumene, Wollastonite. 50 pounds each: Anorthite, Azurite, Cinnabar, Hematite, Lodestone, Monazite, Malachite, Pyrrhotite, Rhodonite, Sphalerite, Witherite. 25 pounds each: Calamine, Cuprite, Halite, Gadolinite, Polycrasite, Euxentie, Marcasite, Samarskite. 10 pounds each: Alabaster, Crude Ceylon Sapphire, Cyrtolite, O Iceland Spar, Powellite, Uraninite, Fergusonite, Titanite.
Box 75-T-3, Ind. & Eng. Chem., Easton, Pa.

Vulcanizer Interior Paint



SEVERAL years ago two engineers at different companies met instant death when the vulcanizers they tended suddenly exploded from the ravaging effect of rust-corroded rivets inside the vulcanizers. Top chemists in the rubber industry sought to develop a paint that would be anticorrosive under high steam pressure and prevent further accidents from explosive vulcanizers.

A paint known as "Bonnejohn", developed by Belke Manufacturing Co., 947 North Cicero Ave., Chicago, is composed of materials properly combined to be anticorrosive under high steam pressures and to minimize sulfurous fumes and acid action. It comes as a boon to the rubber industry at a time when the national defense program requires the protection and care of equipment so important to production needs.

Applied with a brush, Bonnejohn spreads easily with exceptional adhesive qualities and requires no preliminary preparation other than having interior surfaces and fittings reasonably clean before application. It has been tested for durability and will not peel, crack, or blister.

Eye Protection

TODAY'S total warfare, mobilization of woman power as well as man power, has placed greater emphasis on the need for

eye protection. The new-type rimless safety spectacles, manufactured by the Tulca Division, Univis Lens Co., Dayton, Ohio, are being rapidly adopted. They are available with or without removable side shields. Tulca lenses, made of a special new material (not glass), weigh only one half as much as glass safety lenses. This lighter weight factor is said to overcome the tendency to remove the goggle, as with heavier types, thus offering continual eye protection throughout the day.

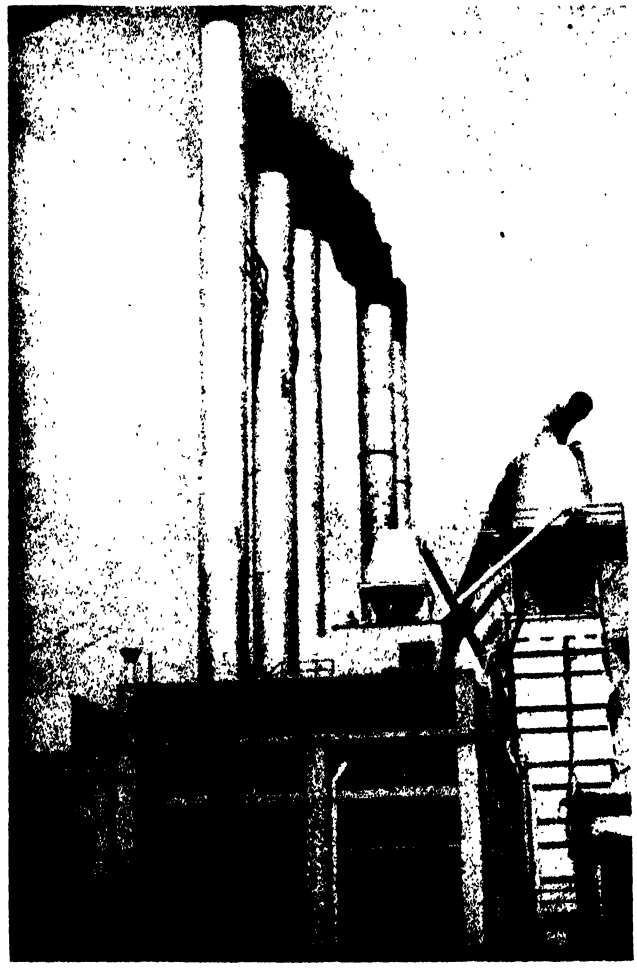
VOLUME 20 APRIL 10, 1942 NUMBER 7

Defense Industry in Memphis

NATIONAL defense presented a challenge to Memphis and the Mid-South when France fell in the spring of 1940. Over night this country realized it must arm itself at once. The squirrel rifle no longer offered protection. What could the agricultural South do to help mechanize our Army? How could it give modern Mars the sword and shield he needed?

Today that challenge has been answered. Memphis has rolled up its sleeves. It has gone to work. Nearly every industrial plant in Memphis and the Mid-South is directly or indirectly producing materials for the Army or Navy. Colonel Memphis, symbol of plantation aristocracy, has felt the impact of national defense, the call to arm, and has enlisted for the duration.

Many plants have been converted from civilian to war production, and a number of new concerns have been established there in the past year. Bomber plane parts are being produced at an ever-increasing rate at the Fisher-Tennessee Division of General Motors, where only wood parts for automobile bodies were once made. The American Finishing Co. in south Memphis is devoting most of its plant facilities to textile finishing for the Army. Firestone Tire & Rubber Co. is making tires that will fit only trucks for khaki-clad men. A year ago the Continental Piston Ring Co. was turning out steel rings for automobile engines; now it has undergone a plant expansion and is producing small shells.



Only recently this city has been chosen as the site for the $1,000,000 Sefton Fibre Can Co. which is to make munition containers for the now famous shell-loading plant between Humboldt and Milan, Tenn. Just south of the city limits is the $15,000,000 Quartermasters' Depot. Nine miles east of town, work is underway on another major munitions industry. The National Fireworks Co. is building a plant to manufacture rapid-fire antiaircraft ammunition, the first contract being for the Navy. Hydrogen gas for the new Paris, Tenn., balloon field is being produced by the Humko Co., and the Ernst Bischoff Co., nationally known manufacturer of pharmaceuticals, has located a plant in Memphis to make ointments for the Chemical Warfare Division of the Army.

Cotton, the basic agricultural economy of the Mid-South, is proving its worth again in a war crisis. Cotton linters are going into gunpowder and the fiber is being used for uniforms and tent cloth. The demand for lumber has been tremendous, but the Memphis market has been able to supply the need.

These outstanding examples of Memphis' answer to the Nation's call for defense materials didn't just happen. They are the result of planning, of intelligent industrial surveys. Memphis was chosen because of its fortunate strategic location—its climate, labor, available supply of pure artesian water, and excellent transportation facilities. In times like these transportation is one of the most important factors engineers have to consider. Because of its transportation—river, rail, air, and truck—Memphis has furnished goods and services with maximum speed.

But national defense in its true sense isn't confined to million-dollar contracts or low-winged bombers. An army must eat and thousands of pounds of beef, canned goods, and vegetables have been supplied by Memphis wholesalers. An army has to have tents, and one lumber company alone has supplied $200,000 worth of wooden tent parts. Another concern has supplied the Army with $5,000 worth of notebooks. An awning company has a $1,000 contract for canvas rolls. Several carloads of paint have been manufactured and shipped to meet defense demands. A small ink manufacturer has a $1,300 order. Inventors Laboratory, a newly formed Memphis concern, is filling an $8,200 prime contract for elbow assemblies for airplanes. Memphis plants furnish fabricated steel parts, precision gages, mill work, mattress covers, and even tooth paste and aspirin.

The trend is too fast and the volume too great to list accurately the actual dollars and cents value of the contracts filled or in force in Memphis. It is safe to say that millions of dollars worth of defense goods are being produced now, materials that are going to back up the Nation's armed forces.

Smokestacks at Memphis-Fisher Aircraft Division of General Motors

Chickasaw Ordnance Works

AN ADDITION to Memphis industries during 1940 was the $25,000,000 explosives plant built by E. I. du Pont de Nemours and Co., Inc., for the British Purchasing Commission. Situated several miles outside the city limits, it manufactures smokeless powder and trinitrotoluene (TNT). An explosives plant requires a large area because the buildings must be located some distance apart for safety. Approximately 5,000 acres of land were purchased during the early part of 1940 and about one half of this was fenced in. The first ground was broken during June and the first smokeless powder granulated in December. Six months from the start of construction to the start of production is an enviable record for a plant of this kind. TNT manufacture did not start until February 1941, because erection of this portion of the plant was not started as soon as the smokeless powder section. Another record established during the plant construction was a safety record of over 3,000,000 man-hours without a lost-time injury. The personnel of the plant averages at present approximately 3,000, most of whom were originally residents of Memphis and Shelby County.

Memphis was selected as the location of this plant for several reasons. First, the area is several hundred miles distant from the seaboard, which minimizes the danger of aerial bombardment. Second, cotton linters are available for the manufacture of smokeless powder. Memphis is the cotton-marketing center for the Mid-South. Third, the supply of high-quality labor is plentiful. Fourth, numerous railroad facilities connect in all directions for shipment in of raw materials and shipment out of finished products. Fifth, the source of good water, absolutely necessary for the processing of smokeless powder, is large and unfailing. Sixth, practically all the raw materials entering into the manufacture of smokeless powder and TNT are available in sufficient quantities within a radius of 500 miles.

The plant consists essentially of six different areas:

Power, which is the source of all water, steam, and electricity used.

Acid, where nitric acid is manufactured by the oxidation of anhydrous ammonia and where nitric acid and sulfuric acid are mixed together. Recovered acids are also concentrated in this area for further use.

Nitrocellulose, where the cotton linters are nitrated to nitrocellulose and the resultant nitrate purified and stabilized.

Powder, where the purified nitrocellulose is mixed with other ingredients and solvents and processed into smokeless powder, which is then given a solvent recovery, water-dry and air-dry treatment. Upon completion of the air-dry treatment, the powder is thoroughly blended and packed into boxes for shipment. An important part of this area is the solvent section wherein ether is manufactured and recovered alcohol and ether rectified.

TNT, where toluene is nitrated to DNT and TNT by means of mixed sulfuric and nitric acids, purified and packed for shipment.

Maintenance, where a considerable portion of the personnel is employed in caring for and replacing equipment. The maintaining of equipment in a chemical manufacturing plant involves constant surveillance to keep production running smoothly.

Of equal importance in plant operation are the service groups- accounting, employment, safety, fire protection, plant protection, transportation, and technical. The last group consists of approximately 125 chemists and chemical engineers, responsible for the quality of the raw matrials and the finished products.

The Buckeye Cotton Oil Co.

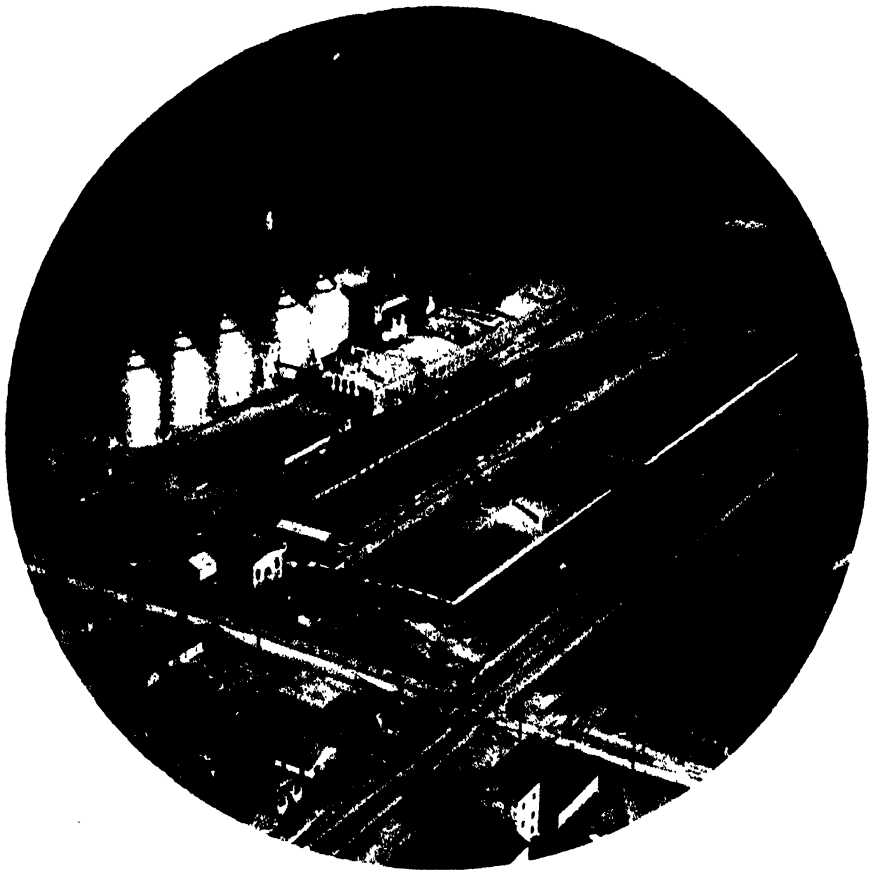
THE Buckeye Cotton Oil Co., a wholly owned subsidiary of the Procter & Gamble Co., was started with a mill at West Point, Miss., when the cottonseed industry was still in its early stages of development. That mill has since been discontinued, but further additions by purchase or construction have enlarged the company until at present there are 15 active mills throughout the South. The operations at Memphis include the Hollywood Mill, largest cottonseed oil mill in the world. The Binghamton Oil Mill at Memphis crushes soybeans, and the Chemical Pulp Division purifies cotton linters for plastics, rayon, films, and smokeless powder.

The Buckeye Cotton Oil Co. established its first laboratory in 1910. With the growth of laboratory control, two division laboratories were established, one in Atlanta for the southeastern territory and one in Memphis at the Binghamton plant for the valley territory. In 1926 mill laboratories were established as a part of the standard equipment at each of its major crushing points, and chemists were employed to handle all local analytical work.

Hollywood Mill

The Hollywood Mill is a relatively modern one-floor mill and represents up-to-date practices in the laboratory control of its many operations. The photograph on the opposite page shows the layout of the mill and storage facilities.

Typical processes of a cottonseed oil mill, of which there are many in the Memphis area, are cleaning, storing, and drying, delinting, hulling, rolling, cooking, pressing, grinding cakes for meal, and pelleting.



The seed is stored in large tanks and houses equipped with fans and ducts for ventilation to prevent "heating". The batteries of conical-top seed storage tanks developed by Buckeye are a familiar landmark in the South. Drying is carried out only as wet seed require it. The seed are cleaned by screening in two stages—first, to remove boles and large trash and second, sand and dirt. Finally an air draft and a magnetic separator finish removal of foreign matter.

The cotton gins receiving the seed from the farmer have removed the long fibers leaving short seed hairs or lint. The delinter used in oil mills is similar to a gin, but because it removes short fibers the saws are set closer together and are sharper. The lint is usually removed in two passages through the delinters giving a medium length or first-cut lint and a short or second-cut lint. The first-cut lint goes mainly into production of high-class mattresses, while second-cut lint is purified for chemical uses. The cottonseed hulls are cracked in a bar or disk huller which in either case passes the seed between two edges with a differential speed. The hulls are then separated from the meats by a combination of screening and air separations. There is a ready sale for cottonseed hulls as roughage for cattle.

To prepare the meats for the cooking and pressing operations, they are passed between rollers driven at the same speed and in direct contact with one another. In passing downward through the stand of rolls, the seed are subjected to successively greater crushing pressure and delivered in thin flakes. This procedure crushes some of the cells and brings the structure to condition so that cooking and pressing will liberate the oil.

Cooking cottonseed is an art which has not been entirely untangled by scientific investigation. In his book on "Cotton-

A.

Hollywood Mill, Buckeye Cotton Oil Co.

seed Products", Thornton says, "The function of cooking is to permit the proper adjustment of the moisture, rupture of oil-bearing cells, coagulate the proteins, coalesce the gummy materials, destroy molds and other lower organisms, make the cake more palatable and more wholesome by inactivating the gossypol."

The meats are delivered from the bottom of the cooker to the former where they are wrapped in a press cloth of human or camel hair and lightly pressed to preform the cake. A typical box press will hold 15 cakes arranged one above the other. After reaching maximum pressure, approximately 4,000 pounds per square inch, it is held constant long enough to allow the oil to drain from the cakes. Twenty minutes is a common drainage time, although it is varied to meet various conditions of drainage, oil price, etc. After settling, the oil is ready to be shipped to the refiners. Upon removal of the cake from the press, the cloths are taken off in an automatic stripper and any soft oily edges are cut off by an automatic trimmer. A considerable amount of the cake is sold as such to mixed feed manufacturers.

Most of the cottonseed cake is ground to meal of definite protein content and sacked for sale to feed mills and livestock feeders. The control of the protein is accomplished by regulating the amount of hulls with the cake. An increasingly larger proportion of cottonseed meal is made into pellets—a form preferred for range feeding of cattle. They are formed by chopping off the meal as it is extruded in cylindrical form through a die.

Binghamton Oil Mill

Growing soybeans in the cotton territory is a recent development. The beans are received and stored in a manner similar to cottonseed but, since there is no lint to be removed, soybean processing is much simpler than that for cottonseed. At the Binghamton Mill modern expellers instead of the older hydraulic presses are used to extract the oil. The expeller is a continuous mechanical press resembling a huge sausage grinder. The cylindrical barrel is made up of bars set from 0.001 to 0.040 inch apart. As the worm forces the soybeans, which have been prepared merely by cracking and drying, through this barrel, the oil seeps out through the openings between the bars. A soybean mill has only two products, oil and cake, whose uses are similar to those from cottonseed.

Chemical Pulp Division

The pulp plant was built shortly after the first World War for the purification of hull fiber. This product, however, was economically suitable for only a limited number of grades of paper, and about 1925 the use of cotton linters for chemical pulp was developed for the expanding rayon industry. With the outbreak of the present war an increasing amount of purified linters are being used for smokeless powder.

Since the average cottonseed oil mill producing linters operates for only about six months a year, enough lint must be stored to carry the pulp plant through the nonproducing season. The lint is tested and graded when stored so that the proper type can be selected from the various kinds of pulp. To prepare a charge for digestion, the bales are opened and the cotton broken up and cleaned pneumatically as far as practicable. The digester is a typical autoclave into which

Huller room at the Hollywood Mill

is charged the cotton and sodium hydroxide solution. The charge is brought up to pressure and, after suitable cooking time, is blown into the wash tanks. The black liquor is drained off, and wash water is used to free the cooked lint from alkali. Bleaching is done with hypochlorite solution under carefully controlled conditions of concentration, time, and temperature. After a proper bleach is attained, an acid sour is given and the charge washed.

The chemical pulp may be finished as bulk or sheet. The bulk pulp is pumped from the storage tubs to a preliminary dehydrator, through rubber wringer rolls and a picker, and fed into a textile dryer. The dried pulp is baled, inspected, wrapped in heavy kraft paper, weighed, and tagged. Sheet pulp is carried through a Fourdrinier machine and cut into any desired size for handling by the plastics and rayon manufacturers. The pulp plant at Binghamton is one of the few of this kind in the United States.

The chief products made from bulk pulp are acetate and cuprammonium rayon, paper, nitrocellulose, and films. The sheet pulp goes chiefly into high-strength viscose rayon yarns, paper, and floor covering (linoleum).

Chemistry's Contribution to the Cottonseed Industry

GENE HOLCOMB
National Cotton Council, Memphis, Tenn.

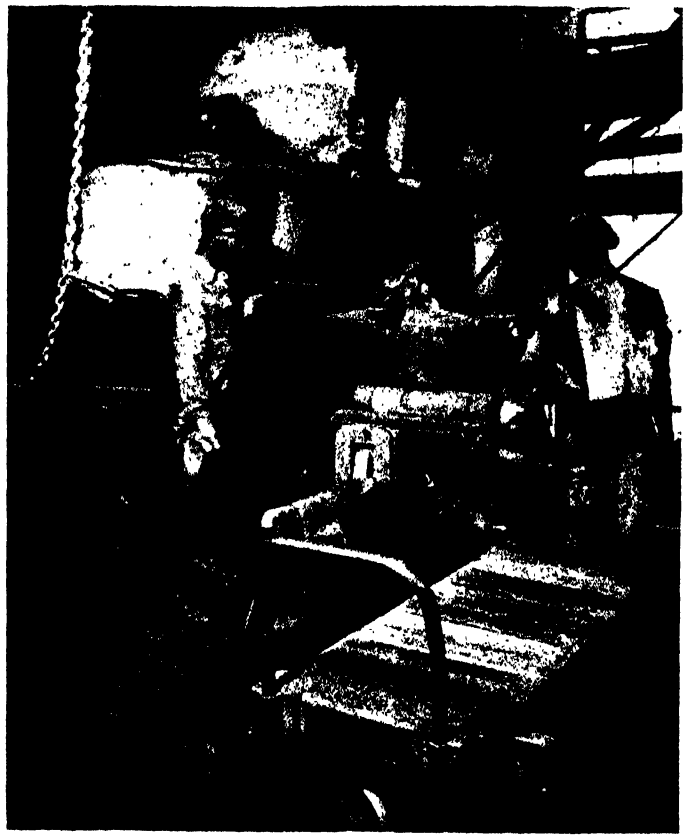
When Harry D. Wilson, Louisiana's venerable Commissioner of Agriculture, was a boy he derived great personal pleasure from the fact that his father's cotton gin was located on a river's bank. This meant that he did not have to spend his Saturdays, as did many boys in the fall, hauling cottonseed to a safe distance from the gin and burning it. He could simply dump the lot into the river and let the current carry it away. Today cottonseed bring to Commissioner Wilson's great host of farmer friends more than $100,000,000 each year. The story of this transformation from waste product to a $200,000,000 industry is principally a story of chemistry.

The first problems of utilizing cottonseed were mechanical rather than chemical. During the first half of the 19th century the removal of linters and the separation of the hulls from the kernels engaged the attention of experimenters. It was generally believed that the oil which the seed contained would find a market as an illuminant. A number of statements were made to the effect that it would displace whale oil in American lamps and drive Yankee whalers from the seas. But whatever the possibilities of cotton oil may have been in the field of illumination, they were never realized. The discovery of petroleum was made at approximately the same time that efficient machinery for delinting and hulling cottonseed was invented, and the new, natural product provided America with illumination until the advent of gas and electricity. Cottonseed oil had to find other markets.

In finding such markets, the chemist played a most important part. Even while cottonseed crushing was in its experimental stage a few far-sighted scientists had predicted that the oil's future lay in the field of foods. They claimed it to be the equal of the finest olive oil and suggested that it be used for the same purposes. Since the oils produced by the early millers with their crude equipment and without facilities for refining was a considerably different product from the cotton oil of today, these early claims were based more on optimism than fact. Even when oil mills began to crush seed in appreciable quantities during the 1870's, most of the oil was exported. The little that was consumed in America usually went into the soap kettles. But about 1880, when the number of profitably producing mills had increased to 45, a number of events transpired which were destined to shape the whole future course of the cottonseed industry. One was the introduction of cottonseed oil into oleomargarine, a new food product imported that year from France. At first the oil was added in small quantities, but later in increasing amounts. In this way a new market in the highly important food field was opened to cottonseed by the chemist.

Cotton gins

At first, however, the effect of margarine upon cottonseed oil was more indirect than direct. Introduction of steam rendering in the meat packing industry had yielded a product known as prime steam lard. Few packers marketed this product themselves. Instead they sold it to a group of processors known as lard refiners, who stiffened the lard by the addition of tallow, lard stearin, or better grades of lard, and sold it under their own name. Development of the margarine industry created a strong demand for two products of the packing industry—natural lard and oleo oil. The latter, made from the highest grade of tallow, yields as a by-product a hard edible stearin. The packers, naturally, welcomed the opportunity to sell these two products to the margarine industry. As a result the lard refiners were left without the best grades of lard and tallow with which to refine prime steam lard. Large quantities of oleo stearin were available, however. It was this combination of circumstances which lead to the discovery of one of the first formulas including cottonseed oil in a new product. The formula called for 8 parts oleo stearin, 38 parts cottonseed oil, and 60 parts lard, and was developed by the N. K. Fairbank Co. of Chicago, one of the first firms in the fats and oils field to employ an industrial chemist, inaugurating the policy in 1879. The chemist was William D. Allbright, a young graduate of Massachusetts Institute of Technology.



The above mixture of lard, oleo stearin, and cottonseed oil, together with the application of chemistry to the manufacture of food fats, marked the beginning of a whole new industry—the shortening industry. A large number of technological developments followed, greatly increasing the usability of cottonseed oil. One of the barriers to using substantial quantities of cotton oil was the fact that it was yellow in color, while the consumer expected a cooking fat to be white. In the early days cotton oil was bleached by exposure to the sun. Large tanks placed on the roofs were used by several manufacturers. About 1880 Allbright and Eckstein introduced the use of fuller's earth for bleaching both cottonseed oil and lard. The oil or lard was heated with from 0.5 to 2 per cent of fuller's earth, depending upon the strength of the latter. At first the earth was removed by settling and decantation. Later the filter press was introduced and, to avoid loss of oil by retention in the earth, dry live steam was passed through the press. This procedure made possible efficient bleaching with little loss of oil.

Shortly after the introduction of chemical bleaching, use of sodium hydroxide in refining was discovered. Previously oil had been refined by the use of pearlash. David Wesson introduced the sodium hydroxide method in the Fairbank plant and it proved to be both efficient and economical.

Even with chemical refining and bleach-

ing, the cottonseed oil retained certain objectionable qualities of flavor and odor. Eckstein was responsible for the process of deodorizing cottonseed oil by heating it to the "cooking" temperature of 340° F. and blowing high-pressure steam through it. James Boyce, chemist for the old American Cotton Oil Co., made substantial improvement in the method and equipment. About 1900 David Wesson perfected the process by introducing into the performance of the operation the use of a vacuum. This permitted the use of lower temperature than was possible under atmospheric pressure and avoided the dangers involved in cooking the oil.

The above chemical advances were accompanied by a rapid growth in the production of "compounds", a term adopted to replace the ill-reputed "refined lard". Approximately 20 trade-marked brands of compounds were placed on the market during the 1880's, and 45 new brands were added during the 1890's. Most of these products contained the cottonseed oil which was becoming increasingly available and desirable. Practically all of them, however, also contained animal fats. The use of cottonseed oil in solid cooking fats was still limited by the available supply of stearin which could be used as a stiffening agent. The final step in this series of chemical discoveries which were to make cotton oil the leading food oil in the United States was hydrogenation. This process was developed in Europe, and, like most discoveries of this type, was the cumulative work of a number of scientists, including Debus, Saytseff, Kolbe, Sabatier, Sendevens, and Normann. By means of hydrogenation, as finally perfected, it became possible to transform a liquid oil into a solid fat by the addition of hydrogen in the presence of a catalyst which, in this instance, was nickel.

NATIONAL COTTON COUNCIL

Slabs of hot cottonseed meal after the oil has been squeezed out

This discovery greatly enlarged the volume of cottonseed oil that could be used in the production of cooking fats. Patent rights to the process were purchased by an American firm, and the first all-cottonseed oil shortening was placed on the American market in 1911. It was widely advertised as an all-vegetable product in an appeal to groups who, either for aesthetic or religious reasons, were unfriendly toward animal fat products.

Chemistry's contribution in making cottonseed oil such a desirable shortening ingredient has been equally valuable to other products. Chemists have enabled cotton oil to become a leading, if not the leading, ingredient in salad oil, salad dressing, mayonnaise, and margarine. Unfortunately, while chemistry has made possible the production of such an excellent economical table spread as margarine, established interests, fearing the competition of this product, have succeeded in imposing upon it taxes which seriously limit its sale.

Chemists, however, have not confined their work in cottonseed to oil. They have been active in improving and developing markets for the other three cottonseed products—cake or meal, hulls, and linters. Cottonseed meal has always been used as a livestock feed. For a number of years, however, there existed considerable misinformation regarding its effect on livestock. Many persons believed that feeding quantities of the meal resulted in "cottonseed meal poisoning". Theorists attributed this condition to gossypol, a toxic substance known to be present in cottonseed. Chemists have proved this theory false. They have shown that the gossypol which remains in meal after processing is rendered incapable of being harmful by the cooking of the meats. The animal nutritionists have contributed their part by demonstrating that so-called

NATIONAL COTTON COUNCIL

NATIONAL COTTONSEED PRODUCTS ASSOC., INC.

Cottonseed stored at cottonseed oil mill warehouse

"cottonseed poisoning" occurs in cases where no meal is fed at all. Finally it was proved that what was thought to be poisoning was simply a deficiency of vitamin A, and that the condition will not occur, regardless of the quantity of cottonseed meal fed, providing the ration includes green pasture or some other source of vitamin A. Particular credit for work in this field is due E. P. Clark and Henry Stevens of the U. S. Bureau of Chemistry and Soils, Fred Hale, Texas Agricultural Experiment Station, C. F. Huffman and L. W. Moore, Michigan State College, A. H. Kuhlman and Earl Weaver, Oklahoma A. & M. College, and others. The work of these men has demonstrated the interrelationship of various divisions of science and has established cottonseed meal as one of the better livestock feeds.

Cottonseed hulls also have been the object of the chemist's research. While used primarily as a roughage for livestock, hulls have indicated considerable potentialities in other fields. Among the products obtained experimentally from hulls are xylose, saccharin concentrate, and furfural, extensively used in petroleum refining. These products, while not yet produced commercially, are a challenge to further research.

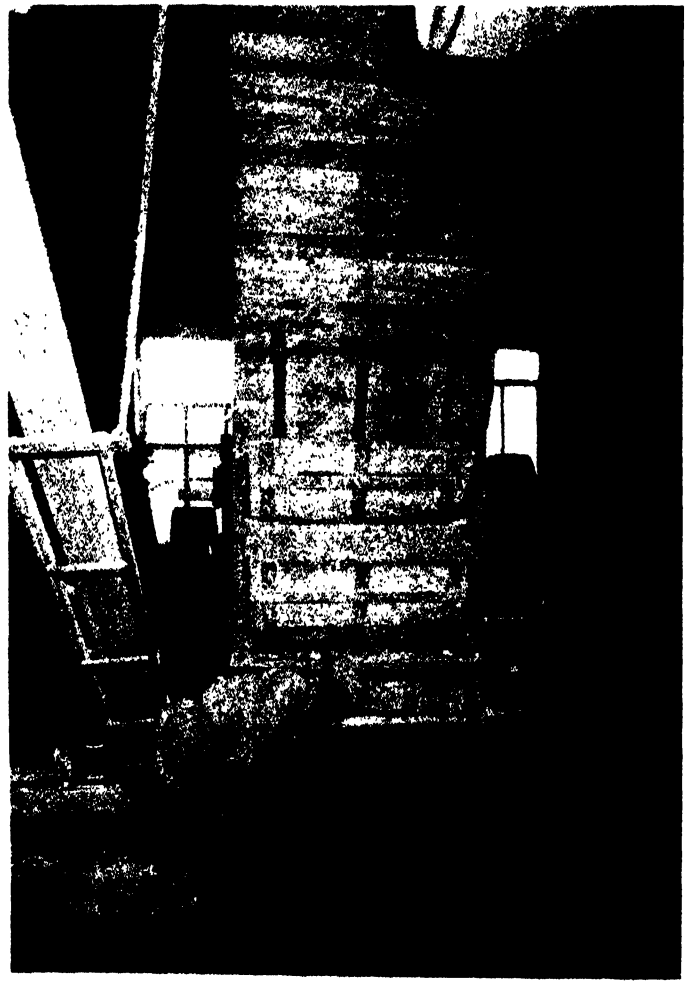
Cottonseed linters are well known as the most versatile of cottonseed products. Linters are practically pure cellulose; and it is common knowledge what the chemist has done with cellulose. Gunpowder, rayon, cellophane, paints and lacquers, safety glass, and the seemingly limitless field of plastics are markets which have been opened to cottonseed linters by the skill of the chemist.

The cottonseed industry, child of chemistry though it is, can lodge only one complaint against the chemist. His interests are too catholic. Each time he finds a new use for cottonseed products, he immediately produces a new competitor. He perfects the use of cottonseed oil in shortening, or oleomargarine, then discovers that soybean or palm oil can be used for the same purposes. He finds that linters can be used to produce rayon, then develops a process which makes possible the use of wood pulp in their place.

Yet this is as it should be. The chemist must play no favorites. He must seek the best possible product at the lowest possible cost. In doing this he not only serves humanity, but also helps retain a free, competitive economy, the life's blood of democracy.

Sets of Abstracts

As USUAL, sets of abstracts of meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about April 15, and will also be on sale at Memphis, Tenn.



This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

Roller breaking cottonseed cake into meal

Investigations at Mellon Institute 1941-42[1]

THE extension of the research activities of the institute occasioned by national defense work was carried forward during much of 1941 in the various ways described in the preceding report [NEWS EDITION, 19, 389 (1941)]. Because of the nature and scope of these investigational projects the transition from defense to war effected few differences in the general character of the programs. Prevision had in most instances indicated to industrial fellowship donors and the institute alike the need for prewar research planning and the change to a wartime basis was made quickly and smoothly.

The research exigencies of the emergency, however, have caused a considerable increase in the personnel of certain fellowships, particularly those concerned with coke by-products, and have resulted in many special studies for federal government agencies by various fellowships, such as those pertaining to heat insulation, petroleum, plate glass, protective coatings, synthetic organic chemicals, and tar synthetics. The range of the investigations of most fellowships has regard for postwar economic problems. Every opportunity is being taken by the institute's donors and fellows to be of broad aid to American science and technology during these days of urgent effort, as will be described subsequently in releasable news about the researches of a number of fellowships. E. W. Reid, on leave of absence from the institute's research staff, has recently been appointed chief of the Chemicals Branch of the War Production Board, in succession to E. R. Weidlein, the director of the institute, who is now adviser to this branch and also chairman of the Synthetic Rubber Committee set up jointly by WPB and RFC.

Outstanding has been the growth of the institute's industrial research staff to 205 fellows (from 187) and 150 fellowship assistants (from 114). The services of these scientists and engineers have been required on the 95 industrial fellowships in operation—the 42 multiple and 53 individual fellowships listed at the end of this report. Seven of these fellowships have been active a quarter century or more, 9 are 20 years of age or older, 12 have concluded at least 15 years of investigation, and 26 have been at work a decade; 53 fellowships have been operating 5 years or longer. There have been no changes in the personnel of the department of research in pure chemistry. During this fiscal year—March 1, 1941, to March 1, 1942—the institute has expended $1,378,752 in carrying on its various pure and applied science projects.

New Fellowships of 1941-42

Nine fellowships have started on their researches during the year: Calcite Technology, Coke-Plant Construction Materials, Fur, Lock-Nut Technology, Naphthalene Chemistry, Packaging, Pine Chemicals, Tape Technology, and Tar Constituents.

Science Assists Calcite Technology. A fellowship has been founded by the Limestone Products Corp. of America to study calcite and the by-products of limestone quarrying, with W. J. Remington as the incumbent, aided by Conrad Trost, a technical representative of the donor. The fellowship has proceeded to investigate the commercial possibilities of Micrite, a new finely pulverized calcite of high purity; the physical and chemical properties of the material have been determined and research is under way on its behavior as a filler in rubber compounds

Utilization of Fur. A. W. Harvey on the fellowship of the Fur Processing Corp. is studying problems in preparing fur for employment in the manufacture of hats, other possible industrial uses for fur, and the disposal of by-products in the cutting of hatters' fur. During the year he has been active principally in the application of the Bealmac process, which, as he and his co-workers have described, eliminates the mercury hazard in the felt-hat industry [NEWS EDITION, 19, 1239–44 (1941)]; this procedure was devised by previous fellowships sustained by the same group [see NEWS EDITION, 10, 99 (1932)].

Research in Naphthalene Chemistry. E. E. Stahly is endeavoring to develop for the Koppers Co. new uses for naphthalene and its derivatives. The most promising potential markets are in the fields of plastics, solvents, dyes, pesticides, and detergents. On the basis of present needs, the current work is being concentrated on plastic compositions.

Novel Applications for Pine Chemicals. A project for the development of new uses for rosins, terpenes, and their derivatives has been initiated by the Hercules Powder Co. with G. B. Feild as the fellow.

Ebulliometry in the Investigation of Tar Constituents. A new multiple fellowship of the Koppers Co. (Wojciech Swietoslawski, senior fellow) is applying the ebulliometric method and the principle of comparative measurements in the examination of the properties of high-boiling liquids. New methods so far contrived have been for the separation of carbazole from anthracene cake, separation of para- and meta-xylenes, based on their physicochemical properties, and separation of the main constituents of the tar-base fraction, especially beta-picoline, in the pure state. In all cases the ebulliometric method has been employed for carrying out analytical determinations of very complex mixtures.

Differential ebulliometer used in determining the purity of separated tar constituents

Completed Fellowship Programs

Eight fellowships were terminated during the year: Carbon Black, Concrete, Cottonseed Products, Printing, Safety Fuse, Silicate, Special Dyes, and Sterilamp.

Carbon Blacks as Adsorbents. The work of the Columbian Carbon Co.'s fellowship (W. J. Remington, incumbent) was concluded by a study of the activation of colloidal carbons with the aim of investiging the possibilities of colloidal carbons for use in adsorption, either in their original form or after treatment. In general the findings revealed that col-

[1] Abstract of the Twenty-Ninth Annual Report of the director to the trustees of the institution, covering the fiscal year ended February 28, 1942.

loidal carbons in their original powder state were not suitable for employment in the purification of water or in the adsorption of vapors, but that a few possessed a very high capacity for the decolorization of sugar solutions. Some of the carbon blacks, prepared in pellet form with a suitable binder and steam-activated, showed marked increases in their capacities for adsorbing vapors and for purifying water. This fellowship had a life of 15 years; its biography abounds in unexpected exploits. The Columbian Carbon Co. will later resume research in the institute on a new program.

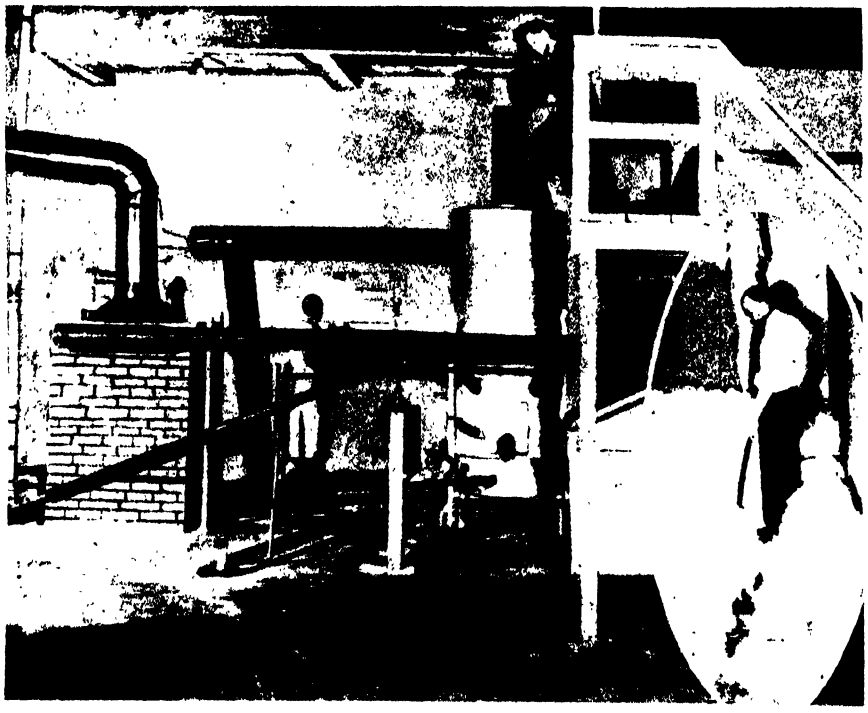
New Precast Concrete Units. The concrete fellowship, under D. R. MacPherson, ended comprehensive research for The Cemenstone Co. on the manufacture of new concrete products for employment in the construction field. The main efforts were directed toward the development of precast units which would have wide applicability in buildings. One of the accomplishments was an insulated light-weight roof panel of low-heat conductivity, composed of concrete and a commercial rigid-type insulating material; this product, on the market for more than a year, has been used successfully in numerous structures. Recently the fellowship finished an investigation of manufacturing methods for large structural units, such as precast concrete columns, girders, and hollow floor and wall panels. Production specifications, based on the experimental work, are guiding full-plant operation on the fabrication of these shapes, whose need by architects and engineers is manifest by the increasing demand for them. The speed of erection of these structural elements is the essence of their utility.

Improved Safety Fuses. The safety fuse fellowship, established in 1930 by the Ensign-Bickford Co., ceased with the transfer of the work to the recently organized Bickford Research Laboratories at Avon, Conn., of which D. E. Pearsall, incumbent of the fellowship, is the director.

During the year the laboratory activities of the fellowship were interspersed with field trips to various mining districts to enable the direct study of blasting conditions. The early investigations pertained to the burning mechanisms and other fundamental properties of safety fuses and to the materials used in their construction. The later researches had for their ultimate aim the improvement of safety fuses and the efficiency of their ignition of explosives. The major accomplishments embrace orange and white wax finished fuses, fuses with special properties, EBP fuse powders, and ignition specialities.

Bibliographic Information

During the calendar year 1941, 5 bulletins, 34 research papers, and 53 other articles made their appearance from the institute. The total publications for the 31 years ended December 31, 1941, have been 18 books, 158 bulletins, and 1,887 journal contributions. Fifty-three United States patents and 14 foreign patents on fellowship inventions were issued in 1941; 854 United States patents and 855 foreign patents have been granted since 1911.



Releasable Information Regarding Continued Industrial Fellowship Researches

Anthracite and Its By-Products Have Definite Advantages. High-grade mineral wool (Anthrafloss) for insulating purposes has been made from anthracite by-products by the anthracite industries multiple fellowship under H. J. Rose. Systematic laboratory investigations were first conducted on the available raw materials, after which the practical possibilities of both cupola and slagging-gas-producer processes were explored in the pilot plant shown in the accompanying illustration. A paper on "Mineral Wool from Anthracite Colliery Refuse and Anthracite Ashes" was presented at the Third Annual Anthracite Conference of Lehigh University. Such materials contain enough, or nearly enough, combustible to supply the heat needed in the process. The resulting white mineral wool contains a higher percentage of alumina than typical rock wool or slag wool and has a very desirable combination of chemical and physical properties.

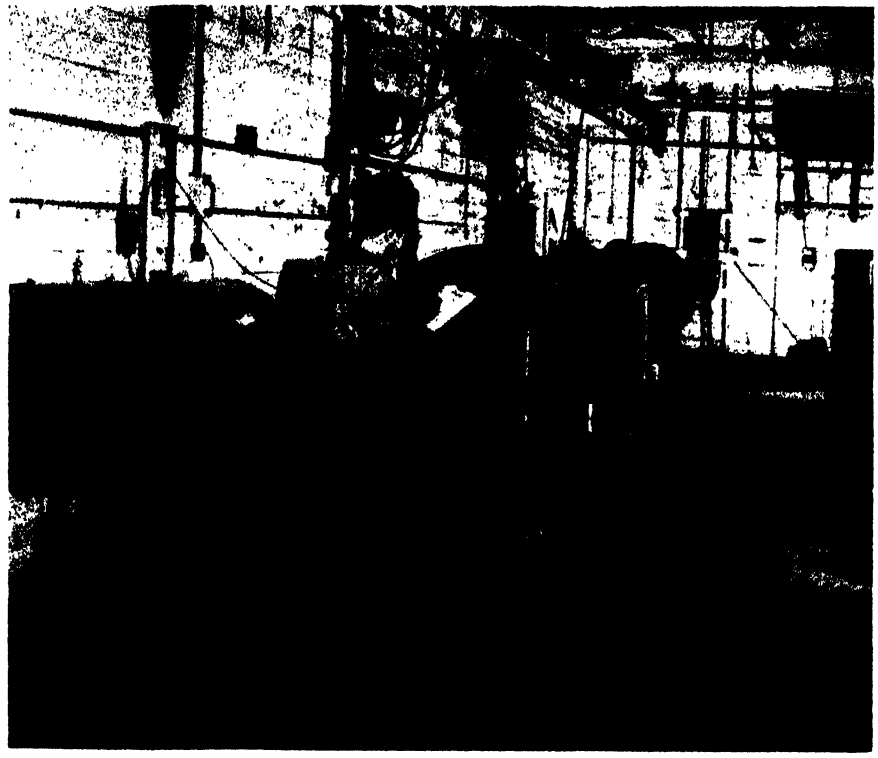
The recent increased interest in civic smoke elimination has resulted in a renewed appreciation of anthracite, which is the only natural fuel that is completely smokeless under all conditions of use. Its advantages have been summarized in an article entitled "Anthracite, the Principal Smokeless Fuel". Engineering studies have continued on methods whereby increased convenience may be obtained with anthracite. Attention has been given to the design of combination coal bins and ash-storage pits of integral masonry construction for new homes, which can be serviced without the necessity for anyone to enter the basement to deliver coal or remove ashes.

The second largest B. t. u. requirement in the average home is for heating the domestic hot-water supply. Systematic tests have been conducted on anthracite-fired tank heaters by methods previously developed. These tests were not made simply to determine the maximum output rating, but rather to study the all-around performance of tank heaters with respect to the various factors important to the domestic user. A published report, "Performance of Anthracite-Fired Water Heaters", records some of the data obtained and demonstrates the great economy with which water can be heated with anthracite, even for small daily requirements. It also sets forth that small tank heaters have greater possibilities with respect to performance and convenience than has generally been realized.

A summary of these and other research projects has been given in a paper, "Anthracite Research at Mellon Institute", submitted at the Fourth Annual Anthracite Conference.

Small-scale production of mineral wool from anthracite by-products. The inserted panel on the right shows the appearance of this wool in the chamber in the rear of the pilot plant.

Progress in Heat-Insulation Investigations. The Philip Carey Manufacturing Co.'s multiple fellowship on heat insulation and roofing, with R. H. Heilman as senior fellow, has followed its studies on the thermal conductivity of a wide variety of insulating materials and on the effects of chemical composition and physical characteristics on the rate of heat transmission through asbestos and magnesia products. The fellowship has aided in the development of an efficient insulating material suitable for temperatures up to and



including 1,500° F., known as Hi-Temp No. 15.

The research, begun a year ago on suitable vapor barriers for low-temperature insulating materials, has been continued. The permeability of a number of materials has been accurately determined under controlled conditions of humidity and vapor pressure. As an additional check on these findings an insulating covering consisting of organic material has been vaporproofed and applied to a pipe operating continuously at a comparatively low temperature with the outer surface exposed to an atmosphere of high relative humidity.

Industrialization of Plast-Sponge and Plast-Iron. The prominent result of the research program of the multiple fellowship of Plastic Metals, Inc., has been the construction of a large commercial sponge-iron plant. This factory, located in Johnstown, Penna., is scheduled for early completion and, when operations commence, the donor will be one of the largest producers of powdered iron in the world.

The sponge-iron powder made in this new plant will have a variety of applications, many of which are of unusual importance in prosecuting the war. Among the most interesting uses of this material is that in which it is compressed into plates which serve as anodes in the donor's electrodeposition process for manufacturing Plast-Iron [NEWS EDITION, 19, 392 (1941)]. Plast-Iron, because of its purity (99.95+ per cent iron), has been adopted by many companies as the standard material for producing high-density powder metallurgical compacts, electrical parts, such as radio cores and magnets, and other articles wherein iron of a high degree of uniformity as well as purity is essential. Another large outlet for the sponge iron to be made in the donor's new plant is in Plast-Sponge powder, which is manufactured by reducing iron ore, mill scale, or other forms of iron oxide to a high-quality sponge iron. After this iron is pulverized, classified, and otherwise processed, it is ready for use in those applications for powdered iron which do not require the unusual purity of Plast-Iron.

In addition to completing the basic research and development work which led to the construction of the new plant, the fellowship, among other things, has undertaken during the past year exhaustive studies of electric power sources and iron ore deposits in the United States and Canada. These studies, which have brought forth many totally unexpected facts, are being continued with the end in view of establishing accurate information for the selection of plant sites and for further commercialization of the processes. Owing to the present shortage of both machine tools and skilled machinists, the various war production agencies in Washington, as well as the procurement offices of the Army and Navy, are displaying keen interest in the art of powder metallurgy. On the basis of the number of defense and offense items which already are being produced by the pressing and sintering of metal powders, it seems reasonable to predict that, before this emergency period is over, powder metallurgy will take its place as a full-fledged industry capable of fabricating many articles faster, cheaper, and better than they were ever made before. With a sound economic foundation, this new manufacture should encounter little trouble after hostilities cease.

Grinding room in the Plast-Iron pilot plant

Beneficial Results Accrue in Gray Cast-Iron Production. The foundry practice fellowship of the National Radiator Co. (W. A. Pennington, incumbent) has as its projects the determination of proper means for adjusting the silicon content of gray cast iron, studies of chemical reactions within the cupola with particular regard to kinetics and thermodynamics, application of statistical methods to plant data to find the probable effects of various factors upon foundry losses, and development of operating procedures to give uniformity of product in the different plants.

In the operation of the cupola to make gray cast iron, about 10 per cent of the silicon of the mix is lost through oxidation. Usually some material which contains iron silicide in high concentration is added in the cupola in such amount that, when 10 per cent of the total silicon is lost, there will still be enough left to give the desired composition. At least part of the silicon adjustment can be made by a reduction in the cupola loss. Thermodynamic studies indicate that the loss may be reduced to half by using a hot blast because the tendency for the oxidation of silicon increases as the temperature is lowered. A material has been used which apparently reduces the loss to practically zero, by being preferentially oxidized with a saving of the silicon. In several instances it has proved to be more economical to adjust the silicon by adding a suitable material in the ladle. Such a material should give an exothermic reaction to prevent an undue lowering of the temperature of the metal. Where oxides are formed by chemical reactions, particularly oxides insoluble in the molten iron, centers of nucleation are furnished for graphite precipitation. This inoculation gives a good distribution of graphite, permitting the use of less silicon and still producing an iron with suitable machinability.

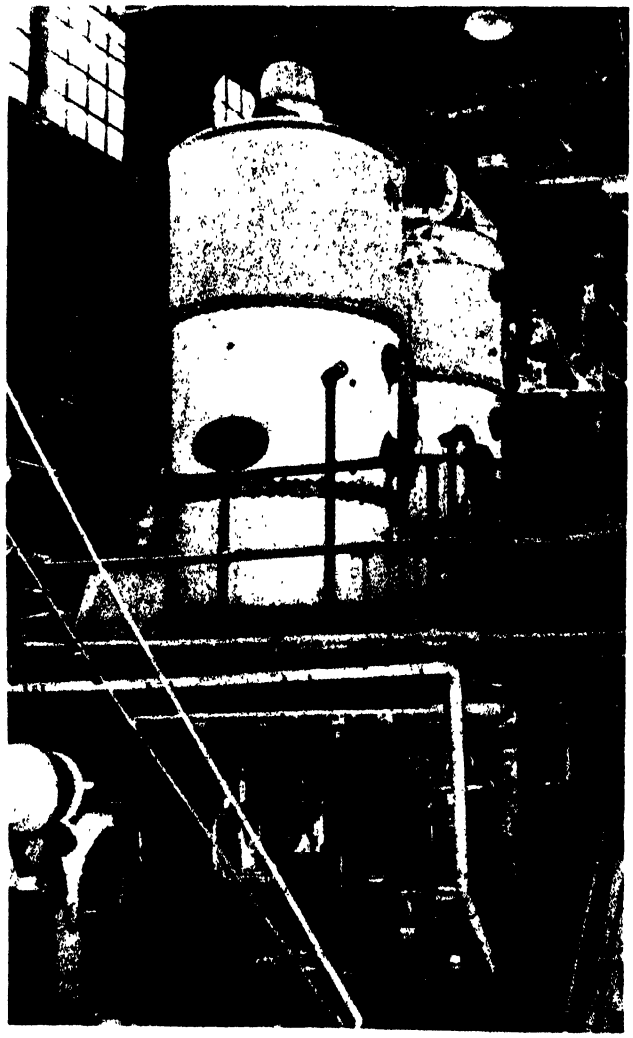
As to the chemical reactions taking place in the cupola, it is not so much a matter of what reactions are involved as it is the specific location and the thermodynamics and kinetics of the various reactions. The melting rate, for example, after equilibrium is attained in coke-bed height, is chiefly dependent upon the rate at which air is supplied and the coke ratio (weight of iron to weight of coke). The greater the volume of air or the greater the coke ratio, the faster will be the melting of the iron. On the other hand, the temperature of the metal will increase as the volume of air is increased and also as the coke ratio is decreased.

Statistical analysis has been employed beneficially in correlating various factors with foundry losses, there being found in

nearly all cases direct linear relations. Good reproducible results are obtained where the principles of probability are employed in this manner. Procedures are being evolved for application in the various plants so that a high degree of uniformity of product may be had. The control tests now being used give more assurance than ever before of obtaining radiator sections of which few will be rejected owing to cold shots and poor machinability. Furthermore, it will be convenient to eliminate practically all the serious casting strain, giving an optimum of strength at points where it is especially required.

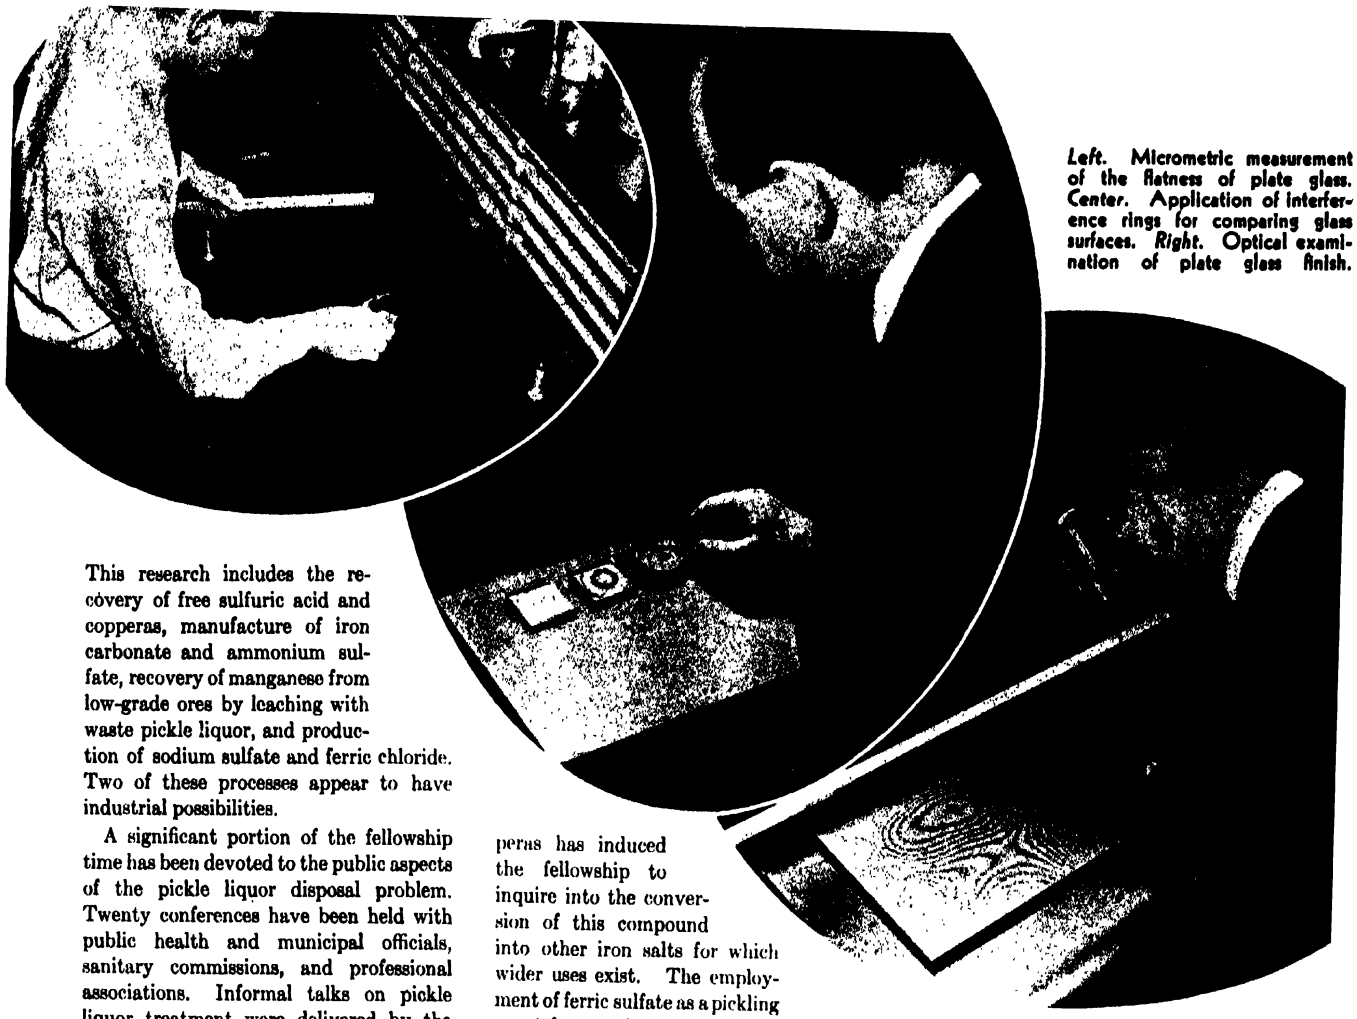
Research Strengthens Wartime Steel Technology. The multiple fellowship of the Pittsburgh Steel Co., whose senior fellow is S. A. Braley, is cooperating with the A. S. T. M. in field tests of metallic coatings for iron and steel. Physical properties of wires subjected to atmospheres of divers types, including severely industrial, mildly industrial, seacoast, and rural, have been investigated. The findings are contained in the latest report of the Wire Inspection Committees on Field Tests of Wire and Wire Products. During the past few years several research laboratories including this fellowship have collaborated in an investigation of methods for oxygen analysis, the project being sponsored jointly by the Iron and Steel Division of the American Institute of Mining and Metallurgical Engineers and by the National Bureau of Standards.

In 1941 the fellowship studied several different types of ferrous materials, such as pig iron, before and after desulfurization, basic open-hearth steels, and stainless steels made in electric furnaces by the vacuum-fusion method. This problem is primarily concerned with an attempt to establish whether certain types of failures in fabrication or service may be attributable to the oxides, hydrides, or nitrides present. It has been shown that desulfurizing pig iron by means of soda ash does not introduce any additional quantities of the oxygen, hydrogen, or nitrogen compounds, thus indicating that a blast furnace may be operated to obtain a maximum yield of iron without regard to the sulfur content and then to reduce the sulfur to an allowable amount by means of a desulfurizing agent without affecting its quality.



As most of the nonferrous metals commonly employed as protective coatings on iron and steel are urgently needed in war matériel, the possibilities of either substituting a nonessential metal or developing new alloys requiring only relatively small amounts of the much needed metals are under investigation. Considerable time has been devoted to hot-dip processes for wire and wire products. Hand-in-hand with this research, attention has been accorded to methods of preparing steel surfaces along with the development of suitable fluxes to obtain the maximum atmospheric corrosion protection with a minimum amount of metallic coating. In the emergency it is imperative that the alloying elements, such as manganese, silicon, nickel, chromium, tungsten, vanadium, and molybdenum, used in the production of steel be conserved. A study of the physical properties obtained by the heat treatment of plain carbon steel wires in conjunction with newly developed quenching oils has yielded useful information.

Assuring Work on the Refining of Chromium. On the multiple fellowship on protected metals sustained by the H. H. Robertson Co. the research being conducted by H. J. Read on the refining of chromium has involved several new approaches to the general problem. Further work is being done along selected and promising lines. As it has been taken as a premise that no significant advances can be made through modification of the methods now used in refining chromium, entirely new techniques are being tried in an effort to refine this vitally important metal. Many domestic and near-by chromite deposits contain ores of too low a grade for use in present metallurgical practice, and a refining process which could utilize such ores would be of the greatest utility, particularly in times of national emergency when high-grade ore from distant sources is not available. This situation is a cogent factor in guiding the course of the present investigation.



The Steady Pursuit of Waste Pickle Liquor Utilization. The acid recovery fellowship of the American Iron and Steel Institute (R. D. Hoak, senior fellow; W. W. Hodge, advisory fellow) has continued, during its fourth year, to evaluate processes designed to recover values from waste pickle liquor, to propose and investigate the potentialities of new procedures, to confer with public health and municipal officials in the solution of problems arising through inadequate pickle liquor treatment, and to advise the technical staffs of steel mills on treatment or disposal methods which best meet their particular requirements.

Three new recovery methods are being appraised. One of them is intended to treat hydrochloric acid pickling waste. Such a process, if economically sound, could become very important to the industry because it would permit the large-scale substitution of hydrochloric for sulfuric acid. Hydrochloric acid pickles much more rapidly than sulfuric and produces a superior surface, but its volatility and higher cost have militated against its large-scale adoption.

New data on a number of the 47 processes of all types previously investigated have been studied. Research initiated in the fellowship laboratory has been conducted on five potential processes for the recovery of values from waste pickle liquor. Investigations on three of these projects have been tentatively concluded, while two processes are still being studied.

Evaporator and crystallizer in the factory of the Sulphiro Co., Martins Ferry, Ohio, in which ferrous sulfate is produced from waste pickle liquor

Left. Micrometric measurement of the flatness of plate glass. *Center.* Application of interference rings for comparing glass surfaces. *Right.* Optical examination of plate glass finish.

This research includes the recovery of free sulfuric acid and copperas, manufacture of iron carbonate and ammonium sulfate, recovery of manganese from low-grade ores by leaching with waste pickle liquor, and production of sodium sulfate and ferric chloride. Two of these processes appear to have industrial possibilities.

A significant portion of the fellowship time has been devoted to the public aspects of the pickle liquor disposal problem. Twenty conferences have been held with public health and municipal officials, sanitary commissions, and professional associations. Informal talks on pickle liquor treatment were delivered by the fellows before four engineering groups. These discussions have led to a better understanding on the part of public officials of the complexity of the problem and the progress being made by the steel industry in reducing pollution from this source. In many cases advice could be given on the solution of specific problems. A discourse on the general subject of stream pollution was published during the year. The fellows also visited 24 steel plants to discuss treatment methods with technicians in charge of pickling operations. These sessions served to broaden the fellows' appreciation of the difficulties encountered in pickle liquor disposal at individual plants and provided them opportunities to suggest the best disposal methods to employ. It is gratifying to point out that, without exception, these technical men are desirous of cooperating with the fellowship, being anxious to adopt processes which can be fitted in with their plant economy. The construction of pilot plants to study certain processes on a scale to enable the evaluation of operating efficiency has been under consideration by several steel companies. Prevailing conditions, however, have made it extremely difficult to obtain the requisite equipment and it is probable that such investigations will have to be deferred for some time.

The saturation of the market for copperas has induced the fellowship to inquire into the conversion of this compound into other iron salts for which wider uses exist. The employment of ferric sulfate as a pickling agent for stainless steel is increasing and has the advantage of releasing nitric acid and dichromates for war needs. Ferric chloride is utilized as a sludge conditioner in 85 per cent of the sewage treatment works which apply vacuum filtration. As research continues to establish the advantages of iron salts in water purification and in the treatment of sewage and organic industrial wastes, these compounds will receive recognition from potential users. The fellowship has developed interesting possibilities for the manufacture of compounds which find a large field of utility.

Science in Cast-Iron Enameling. On the American Radiator and Standard Sanitary Corp. fellowship D. G. Bennett has been working on numerous problems involved in the dry-process enameling of cast iron. The composition of pig iron has been given searching scrutiny as have the clays of importance in keeping a cupola in continuous operation. Iron, as cast, has been investigated as to constitution and inclusions by chemical and spectrographic methods while comprehensive physical tests have been carried out. With the development of bathroom fixtures of increasing usefulness and beauty considerable effort must be devoted to making sure of their durability under extreme conditions of service. As indicated, the cast iron, the foundation material of a fixture, has been studied from every point of view.

A very high degree of adherence of the enamel to the metal is essential. As this property is hidden, success in attaining it is indicated where the enameled ware user is practically unaware such a problem exists. Test methods have been worked out that aid in the development of adherence to a high degree with a concomitant decrease in the probability of enamel failure. The porcelain enamel itself has been and is being investigated from the standpoints of its proper fit to the metal, body and surface hardness, resistance to chemical reagents, reflectance, and opacity. In short, with the progressive development of ware exemplifying function and grace, the fellowship's efforts are devoted toward maintaining and improving the chemical stability and mechanical strength of the brilliant and attractive porcelain enamel finish applied to cast-iron fixtures.

Better Hollow-Ware Enameling Materials. The ceramic chemicals fellowship maintained by the O. Hommel Co. has E. E. Marbaker at work on problems incident to the adaptation of the Hommelaya (two coat–one fire) process to the enameling of hollow ware. The scope of the fellowship also includes the investigation of raw materials, such as clays of domestic origin, and a definitive comparison of a number of enamel clays has been made. Determinations have been

concluded on the effects of these clays in a standard ground coat formula on setting power, measured by the weight of enamel adhering to bare pickled and to ground-coated steel plates, and on viscosity. The results, which serve as a basis of appraisal and classification of the clays, have led to an inquiry into the action of varying amounts of setting agents on the properties of slips in which the clays are used.

Basic Research in Flat Glass. The fellowship on plate glass technology of the Pittsburgh Plate Glass Co. (F. W. Adams, senior fellow) has effected substantial advances in methods for evaluating the flatness and texture of surfaces. These accomplishments enable exact analyses of commercial glass grinding and polishing operations and assist in the production of glass for special purposes. Plate glass of sufficient flatness for use as surface plates for fine gaging work affords a superior replacement for the older metal plates. The use of monochromatic light in developing interference patterns or Newton's rings permits a rapid examination of surface finish and flatness. Glass approaching optical flatness may be produced for test plates and other purposes requiring high accuracy of surface. The ready and positive identification of glasses of different types makes this interference technique useful in many applications. The topographic profilograph, which graphically measures surface textures, has been very valuable in studying details of the processes of grinding and polishing glass; it has also proved of real utility in developing the Nucite glass chalkboard and in showing the permanence of its surface under conditions of extended use. Accurate measurements of thickness and parallelism of surfaces of plate glass have been helpful in improving it to a point where superior optical properties are realized, leading to products suitable for many special purposes.

Garspar, Garcolite, and Gartex. The mineral products fellowship, sustained by Norbert S. Garbisch, has carried forward under G. J. Bair its studies of waste grinding sand from plate-glass manufacture. Improvements in the processing of the products Garspar, Garcolite, and Gartex have been incorporated in the plant operation at Ford City, Penna. Further investigations of particle size fractionation and chemical surface treatment are being conducted to obtain products having specific properties for new applications.

Commercial tests of Garspar, the flux-containing silica, in pottery and glass have been extended and new markets developed. Many large production melts of Garspar glass batch prepared by the Garco process, an important development of the fellowship, have substantiated the previous experimental results and predictions. A batch prepared of Garspar in this manner will melt into a finished glass in a small fraction of the time required for a normal batch. A commercial plant to prepare batches this way has been constructed and is in operation.

Regard for a new organic thiocyanate

Garcolite has been used as a pulverulent aggregate in concrete for highways, a flood-control dam, ready-mix concrete, floors, and concrete blocks. Its fine particle size and surface characteristics well suit it for plasticizing a concrete mix. It reduces segregation and bleeding, increases strength and density, and enhances the finished appearance of concrete. Although Garcolite possesses no hydraulic properties itself, it is surface-active to cement and by extending the cement paste it gives the properties of a much richer mix.

The associated fellowship research on Gartex has been continued by K. J. Miller. Gartex is the processed filler for rubber, plastics, paints, and the like. Studies of this product in hard rubber compounds and synthetics have been particularly fruitful. The investigation of new surface treatments is an important phase of this work.

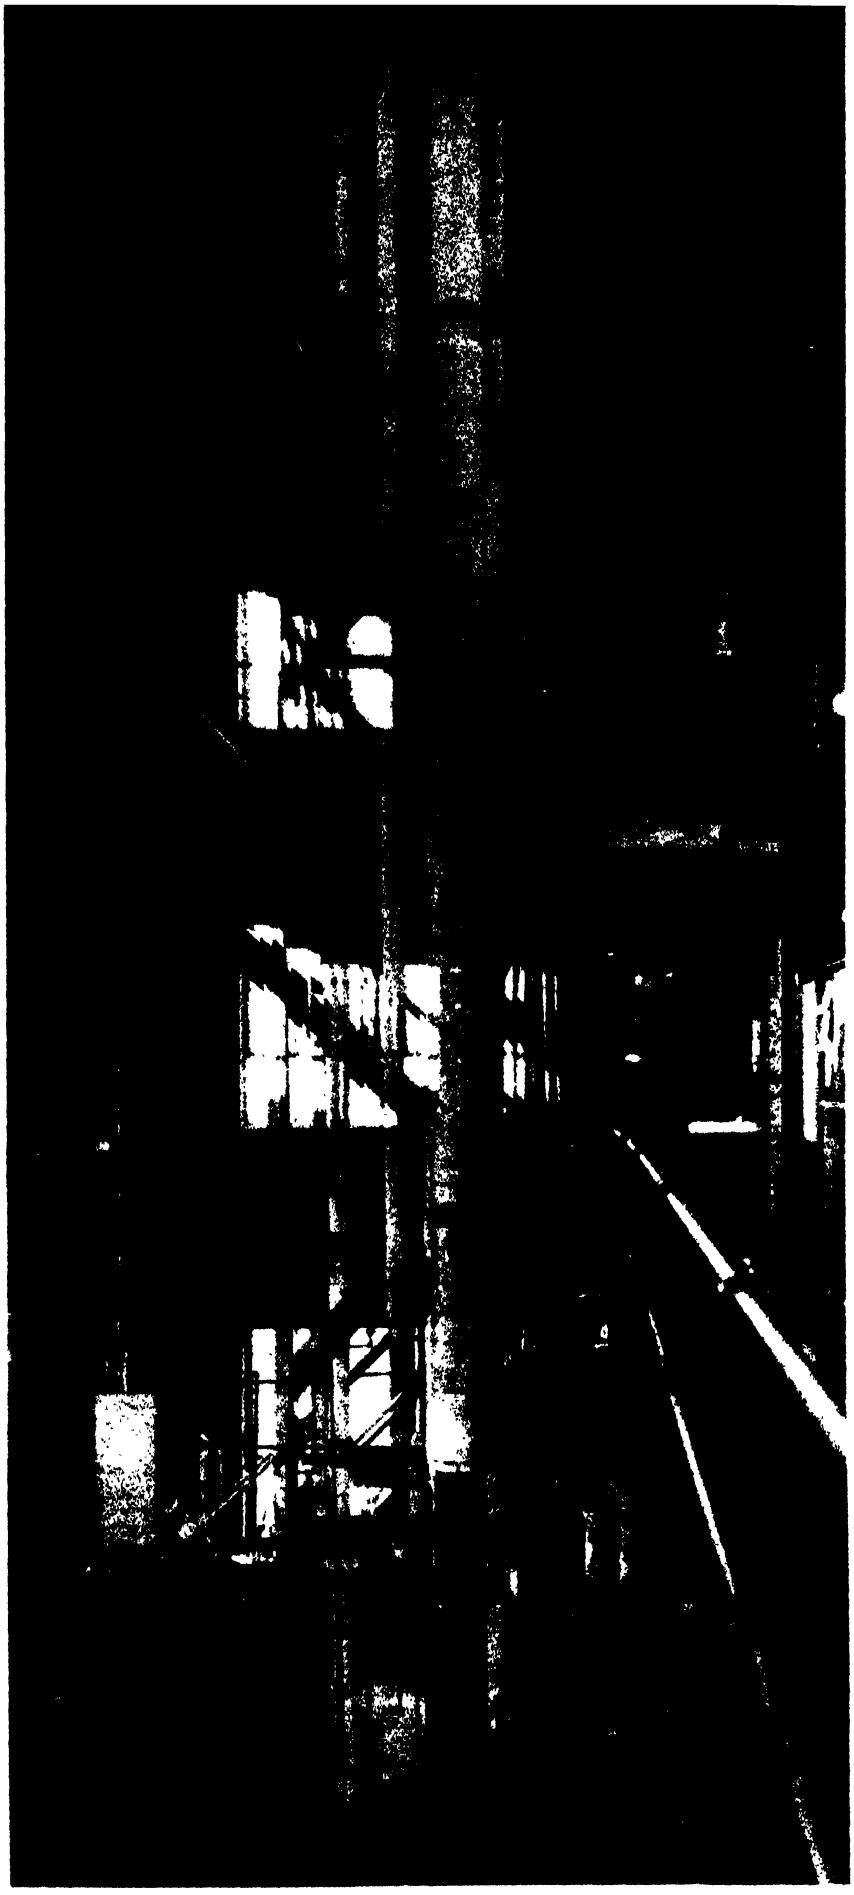
Furtherance of Uses for Sulfur. M. G. Mayberry and his associates on the multiple fellowship of the Texas Gulf Sulphur Co. have proceeded with the study of new and improved applications of sulfur. Cements prepared by mixing sulfur and aggregate have found increasing utilization because of their acid resistance. The effects of various agents on the properties of sulfur cements have been investigated. Additions of furfuryl alcohol, beta-naphthol, and a sulfur-aniline reaction product improve certain properties of the cements and increase their possible uses. The properties and uses of sulfur as a filtering medium have been determined. Following experimental conditions comparable to those encountered in commercial water filters, the efficiency of sulfur in removing sediment from water was found to equal or surpass that of sand filters.

Fundamental research on the reaction of gaseous olefins with sulfur has enabled the explanation of the effects of temperature and concentration. The reaction products have been isolated and factors influencing polymer size are being investigated. Polymeric hydrocarbons have also been reacted with varying amounts of sulfur, thermoplastic resins having been obtained. These plastics have softening points ranging from 55° to 70° C. and are soluble in most organic solvents, including aromatic hydrocarbons, chlorinated hydrocarbons, and ketones; they are resistant to salt solutions, dilute alkalies, and most acids. Mastics have been prepared by mixing the resins with plasticizers and fillers. The resins may be modified by the addition of drying oils, the products being infusible and only slightly soluble in most organic solvents: a typical modification has good adhesion to metal, has been used as a coating material for cloth and paper, and is utilizable with fillers in making mastics.

Thiocyanates and Their Applications. According to W. H. Hill and his aids on the multiple fellowship on gas by-products of the Koppers Co., other inorganic thiocyanates besides ammonium thiocyanate have been investigated, and more organic derivatives have been prepared. While sodium thiocyanate is much less corrosive than the ammonium salt, it is more hygroscopic, picking up water at relative humidities higher than about 30 per cent. For many industrial uses the barium salt may prove desirable, for it is more readily handled than the others and lends itself to the production of various thiocyanates by double decomposition with sulfates of the appropriate bases. Increasing attention has been paid to the recovery of hydrocyanic acid from coke-oven gas in forms in addition to the thiocyanates.

The new pigments and pickling inhibitors mentioned last year have been developed further and evaluated on larger scales with promising results. A new series of rubber accelerators has been discovered that seems to be as good as or even better than the compounds most commonly used in industry.

Investigations on Coke-Oven Light Oil and Its Derivatives. The Koppers Co.'s



tar distillation fellowship headed by W. L. Glowacki has continued its long-term program of research on the upgrading of the components of coke-oven light oil and studies of analytical methods relating to these materials.

Important results have been obtained during work directed to the wider utilization of 3° tar bases and coke-oven light-oil forerunnings, xylenes, and crude heavy solvent. In the field of analytical procedures an attempt to fill a long-felt want was made through the publication of a pamphlet entitled "The Determination and Examination of Light Oil in Gas" (American Gas Association, New York, N. Y.), a compendium of modern methods for producers and users of light oil primary derivatives. In cooperation with the National Research Council a comprehensive description of the light-oil industry has been prepared for a general treatise on the chemical utilization of coal.

The Properties of Tars and Pitches and Their Improvement. Studies of the physical properties and distinguishing characteristics of various bituminous materials have been extended by W. F. Fair, Jr., and his co-workers on the multiple fellowship on tar properties of the Koppers Co. Emphasis has been put on the measurement of absolute viscosities of tars and pitches and on the determination of temperature susceptibilities. Methods for bringing about changes in certain of these characteristics in desired directions and prolonged investigation of the rheological properties of regular and improved tar compositions indicate to better advantage the types of tars and pitches most suitable for various applications and also suggest additional industrial outlets for the modified materials. Accelerated aging, outdoor exposure, and practical service tests of various kinds are being made in connection with this program to establish correlations between specific properties and actual performance for various types of tars and pitches.

New Products from Tars. On the multiple fellowship on tar treatment of the Koppers Co. (C. F. Winans, senior fellow) the researches have progressed along several lines, some of which are supplemental to earlier investigations. In the beneficiation of heavy creosote oil, pitch oil, and coal tar itself by hydrogenation, the boiling range is in every case lowered so that the products of hydrogenation fall in the distilling ranges for solvents and creosote oil. Careful distillation of these hydrogenated products has given solid and liquid distillate fractions of varying aromaticity. The hydrogenation of the residue formed by the distillation of tar acids (phenols, cresols, xylenols) has given rise to additional amounts of valuable tar acids.

A process has been carried over into a pilot plant for the complete and economi-

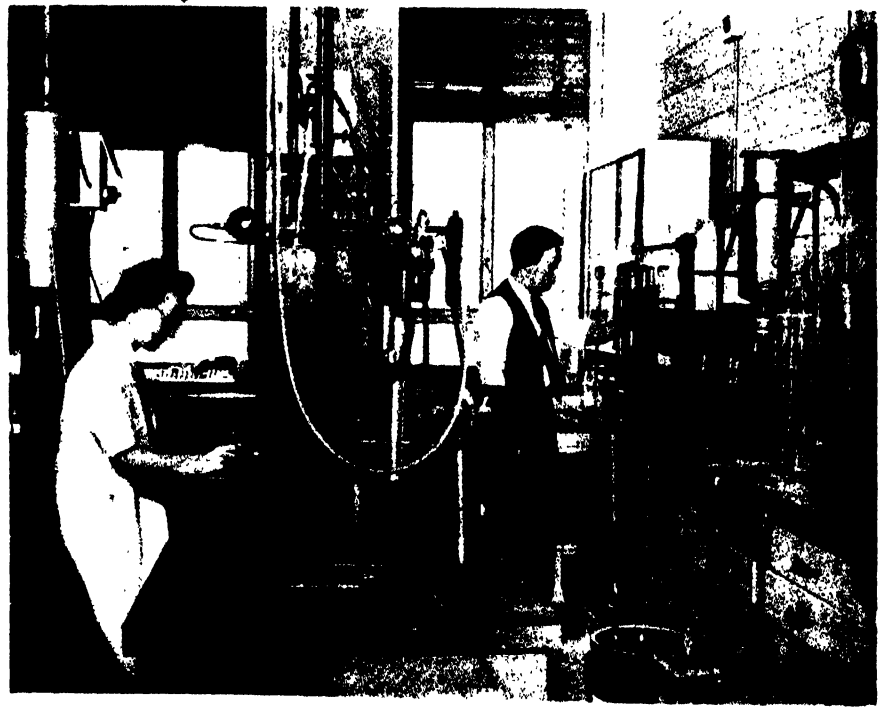
cal separation of beta-picoline, gamma-picoline, and 2,6-lutidine from a tar-base fraction known as 3°-picoline mixture; this method yields products of substantially 100 per cent purity. A program of separation of other complex coal-tar fractions to obtain pure products is being followed and a variety of chemical derivatives is being prepared in the laboratory.

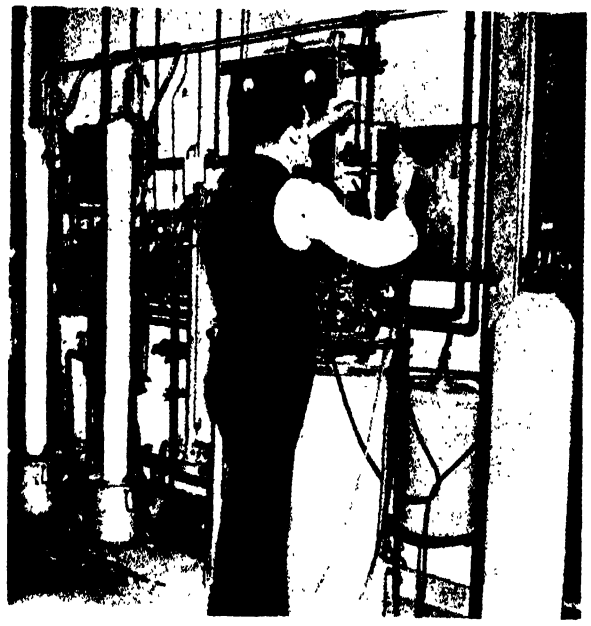


Gratifying Progress in Waste Disposal from By-Product Coking. The multiple fellowship of the Carnegie-Illinois Steel Corp., now in its ninth year, is coping through research with problems of waste disposal in the by-product coking industry, which has justly acquired the term "by-product" by reason of its use of the secondary output of coal carbonization. Out of the work of the fellowship have come new methods for recovering and utilizing several materials.

Among the problems investigated by the incumbents, P. J. Wilson, Jr., senior fellow, and J. H. Wells, has been the elimination of organic matter from ammoniacal liquor. This liquor, after removal of ammonia, is a major industrial waste, and the presence of organic matter adds greatly to difficulties in its disposal. Procedures evolved by the fellowship for destroying the organic matter by oxidation have been protected by patents. The greater portion of the organic matter in the liquor, for instance, can be oxidized by adjusting the pH of the solution slightly on the alkaline side, adding a small amount of sodium sulfate, and electrolyzing with anodes of lead peroxide. Phenols can be completely broken down by electrolysis with graphite anodes, using current densities of about 0.1 ampere per square decimeter.

The residues which accumulate in the stills for fractionating light oil in coke plants have usually been burned or discarded. The study of this waste by the fellowship has led to the development of methods for effecting the conversion into resins and high-boiling aromatic solvents. As these products have been shown to be of commercial value, the still residues can now be sold. An investigation of the pyridine bases present in the gas and tar fractions was initiated by the fellowship in 1935, and work on their recovery and utilization was continued over a period of years, leading to the construction of two plants for the production of pure pyridine as well as several of its methyl homologs. The manufacture of pyridine in the United States has multiplied many times within the past few years and has made possible its extensive application in such fields as pharmaceuticals, textile waterproofing and dyeing, and organic synthesis. During the distillation of light oil, low-boiling compounds come off below 80°, the boiling point of benzene. These forerunnings have generally been discarded to the atmosphere or returned to the coke-oven gas. Analyses made by the fellowship on typical samples have shown the presence of a relatively large proportion of cyclopentadiene, of great interest as a potential copolymer in the preparation of synthetic rubbers and resins and for the synthesis of other organic compounds. Accordingly a process for the commercial recovery of this cyclopentadiene has been evolved.

Contributions of Value to Natural Gas Technology. The investigation of the composition of the various grades of natural gasoline manufactured by the Peoples Natural Gas Co. has been the major problem of the multiple fellowship whose head is R. W. Miller. Owing to the paucity of fundamental research in this field, little has been known in the past regarding the exact composition of the majority of the natural gasolines produced in the United States.



A fractionating column, capable of handling gasolines at pressures as high as

A pyrolytic laboratory of the multiple fellowship on tar synthetics

60 pounds gage, has been designed and constructed. With the aid of this apparatus, several grades and types of natural gasoline and casinghead gasoline have been analyzed. The data obtained thus far have revealed that certain of the products contain amounts of isobutane and isopentane which make them desirable for sources of alkylation materials and for the production of 100-octane grade aviation fuel. As a result of the analyses of the natural gasoline and the natural gas at one of the stations, the feasibility of installing a butane extraction plant was demonstrated. Normal butane is useful in the manufacture of butadiene for synthetic rubber production. It has also been possible, by the comparison of products at several of the manufacturing stations of the donor, to determine the conditions which contribute to the yield of high-grade gasolines.

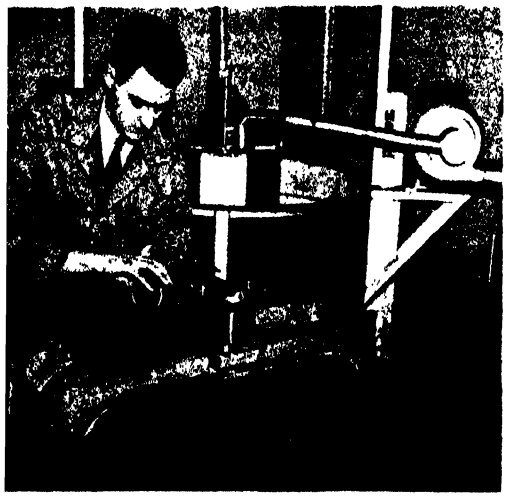
Special investigations have been conducted on corrosion problems concerned with the donor's products and their use and on the prevention of the formation of natural gas hydrates. A plant for the injection of methanol into the natural gas transmitted into New York State has been installed for the latter purpose. Equilibrium studies of the amount of methanol retained in the gas and the effectiveness of the process are being made. During previous years appreciable reduction in the capacity of the pipe line has occurred because of natural gas hydrates.

Construction of apparatus for a study of the composition of crude petroleums

Petroleum Problems Prosecuted Productively. The multiple fellowship of the Gulf Research and Development Co., in operation since 1911 and supervised by W. A. Gruse since 1923, has had another year of creative activity. The elaboration and application of micromethods for the examination of petroleum oil materials have been advanced. The microtitration for acidity has been simplified and now gives acceptable results on 0.05 cc. samples of oxidized oil. The analytical oxidation itself is done on a microscale, using 1 cc. samples, a considerable number of which can be handled at one time. Correlation with known macromethods of oxidation is under way. The study of the chemical constitution of certain lubricating oils, carried on for several years, has been brought to a temporary conclusion and the results are being prepared for publication.

Research on fractional distillation under diffusion pump vacuum has been continued. A quantitative examination has been completed on the performance of a new type of high vacuum column, unpacked, but of such construction as to be equivalent to several theoretical plates; the findings are to be presented in a paper. Search has gone on for pairs of high boiling, thermally stable liquids suitable for evaluating column performance at relatively high vacua. The requirements are very exacting and no entirely satisfactory materials have been discovered. In the meantime a method has been devised for the comparison of vapor pressures of relatively nonvolatile liquids that is readily applicable to the determination of initial vapor pressures of oils in the lubricating class. The results will be published.

The study of the chemical constitution of high-melting waxes has been carried onward as has that of the over-all chemical nature of crude petroleums. Work with the mass spectrograph for the examination of hydrocarbon decomposition reactions is still in progress. A by-product of some of the chemical investigations now going on is a very satisfactory method for determining the make-up of some of the complex mixtures of phenols available in natural materials and industrial products.



The prototype engine work has been directed in part at locating the causes for low-temperature corrosion of some of the newer alloy-bearing materials used in high-speed engines; the data will be made available. Following specifications laid down in this laboratory, a flexible-type single-cylinder test engine for lubricating oils has been designed and is being built in small numbers.

Research on Oil Cleaning Goes Onward. The fellowship of the Fram Corp. (G. O. Ebrey, incumbent) has progressed in studying the principles and factors involved in the removal of solids from liquids, such as lubricants. The relations among these factors have been found to be of great importance. The fellowship is aware that in lubricating oil filtration, as in many other procedures for removing particles of extremely fine subdivision, not all the particle separation can be explained on a purely mechanical basis but that influences are exerted by surface phenomena as well as simple straining. The removal of finely divided solids from a viscous liquid while still maintaining suitable liquid flow presents some unusual problems. A number of types of filter media with different physical properties have been tested to determine their applicability for separating solid sludge from oil. Then, too, the effect of thickness of sludge cake on permeability to oil flow has been investigated. Research has also been conducted on the physical and chemical nature of the general types of impurities which contaminate oils in use, to aid in the quest for the best means of removing them. The increasing use in lubricants of additives, particularly of the detergent type, has introduced new problems which are getting attention.

Probing the Composition of Petrolatum. The fellowship of the Chesebrough Manufacturing Co., under W. S. McClenahan, is pressing on in the fractionation and analysis of crude petrolatum stocks. The order of procedure has been to separate a residuum into its major components, which are then subjected to systematic vacuum-distillation and solvent-extraction processes. The final fractions are being analyzed to determine in so far as possible the structures of the compounds in them. These results are being correlated with practical problems related to the refining and utilization of petrolatum.

Novel Synthetic Organic Chemicals and Their Uses. The 28th year of operation of the multiple fellowship on organic synthesis, supported by the Carbide and Carbon Chemicals Corp., has followed the established pattern of development of new products and utilization of these chemicals to meet changing demands of the industries.

Investigations on the manufacture and applications of amines, detergents, lubricants, hydraulic fluids, and synthetic resins have been lengthened with success. The commercial use of a water-soluble lubricant in the processing of woolen fibers was accomplished. Means for controlling the extent of corrosion in gas-purification plants was discovered. Diaminoethyl sulfide was prepared on a semicommercial scale. Quaternary bases were studied. The utility of amines in ore flotation was

Coating cloth with Vinylite resin during formulation research on solutions of this plastic

established and production was undertaken on a pilot-plant basis. Hydraulic fluids were formulated which successfully met the exacting requirements of the aviation industry. Research on oil additives has uncovered products having marked detergent and antioxidation properties. An extreme-pressure additive, passing the government specifications for dual-purpose lubricants, has been developed. The search for successors for materials unobtainable because of the war has brought forth several promising products.

Synthetic resins and related products have received special heed. Adhesives for the bookbinding and leather industries have been developed. The use of plastic sheeting in place of leather in the footwear and luggage fields is well beyond the experimental stage. Impervious coatings for cloth and leather have been improved by the use of vinyl resins. Many plasticizers have been prepared and evaluated in coatings to meet specific requirements.

Advances in Chemical Hygiene Investigations. Serving on the multiple fellowship on chemical hygiene of the Carbide and Carbon Chemicals Corp., H. F. Smyth, Jr., and his enlarged staff of eight have broadened their studies of new organic compounds. During the year it has been possible to start research on the physiological changes caused by these materials as contrasted with their pathological effects, and some observance has been given to detoxication mechanisms. To aid in filling the need for information upon a rapidly growing list of newly important chemicals, a series of range-finding tests has been selected and standardized to bring out in the least possible time the particular health hazards of each material which must be guarded against during industrial production and utilization. The results of two studies have been published—one involving some physiological effects of the Tergitol penetrants and the other the acute oral toxicity of 60 glycol derivatives.

Answers to Questions Concerning Tobacco Moisture and Smoke. A previous report of the multiple fellowship on cigaret technology of Philip Morris & Co., Ltd., has dealt with moisture in tobacco—a problem of major importance. The phase of the subject under recent investigation by C. F. Bailey, senior fellow, and A. W. Petre has been a determination of the equilibrium moisture content of numerous blends and leaf tobaccos over a range of temperatures and relative humidities. A special laboratory cabinet has been built, which for this work has several advantages over other types of air-conditioning equipment. Means of heating, cooling, humidifying, and dehumidifying are provided, and the apparatus is flexible in operation, as will be described in a forthcoming article.

In research on smoke analysis, a method has been contrived to give an index of the total mass of cigaret smoke. The reproducibility of preparation of smoke samples to be used for examination has been increased, and thereby data on the content in cigaret smoke of another fraction of constituents have been obtained. In general the analytical work has been restricted to selected fractions, but, weighing the results, it is clear that a gain has been made in finding the requirements of cigaret smoke analysis.

Several New Foods; an Investigation on Food Flavors. For its donor, H. J. Heinz Co., the multiple fellowship on food varieties, supervised by E. R. Harding, has perfected a new type of instant baby cereal, of high nutritive value through fortification with minerals and vitamins. Comparative laboratory and clinical studies have proved its easy digestibility and nutritiousness with relation to preparations of the same general type now on the market. Two more novel products—vegetable beef stew and chopped peaches and plums—are additions to the donor's line of junior foods.

Further studies have been made on the nutritional value of the donor's products, including nicotinic acid assays by the biological method. The 10th edition of "Heinz Nutritional Charts" was issued; some important new sections were added and the data of several tables revised. The quarterly publication, *Nutritional Observatory*, now in its third volume, is being enthusiastically received by physicians, dietitians, and others interested in foods.

A new project of the fellowship is a broad survey of the whole field of food flavors, to be followed by laboratory investigations expected to lead to improvements in residual natural flavors in manufactured foods and to the development of new edible materials suitable for flavor enrichment or the production of distinctive and novel flavors upon blending with other foods.

Science in the Train of Tenderay. The Kroger-Westinghouse fellowship, which is studying problems related to the rapid tenderization of meat, has been devoting particular attention to the processing of cuts of beef for the institutional trade, hotels, clubs, and restaurants. Such beef is handled in the form of wholesale cuts, usually ribs and loins, ranging in weight from 20 to 37 pounds in the case of ribs and 52 to 78 pounds for loins. Processing for 48 hours at 68° to 70° F., with a

A tasting committee appraises the flavors of several new food varieties.

relative humidity of about 90 per cent, and in the presence of the usual irradiation with ultraviolet of wave length 2537 Å., gives results in tenderness and juiciness superior to those obtained by hanging at 34° F. for six weeks in accordance with the usual commercial practice. Shrinkage and trimming losses are reduced 88 per cent in the Tenderay process.

Since commercial operations began in March 1939, 23 Tenderay plants have been installed. The New York, New Haven, and Hartford Railroad Co. now has a Tenderay unit in its commissary department in Boston, where all beef served in dining cars on that line is processed.

The fellowship is engaged in an investigation of various forms of spoilage of raw meat that have been a continuous source of loss in the meat-packing industry. Main study is being given to the early recognition of certain spoilages of obscure origin, popularly believed to result from careless handling after slaughter. Evidence rapidly accumulating indicates that this trouble is the result of an antemortem infection, and efforts will be directed toward its detection so that development of the souring, which is nonpathogenic, can be prevented.

Another Year of Success in Cotton Research. The multiple fellowship sponsored by the nonprofit Cotton Research Foundation, technical agency of the National Cotton Council of America, entered its fifth year of activities designed to aid in solving economic problems confronting the cotton industry. The diversity of cotton products, including lint, linters, oil, hulls, and meal, and the ramification of uses into which these products go have necessitated the pursuit of a quite inclusive program of investigation by R. F. Nickerson, senior fellow, D. M. Musser, fellow, and several assistants.

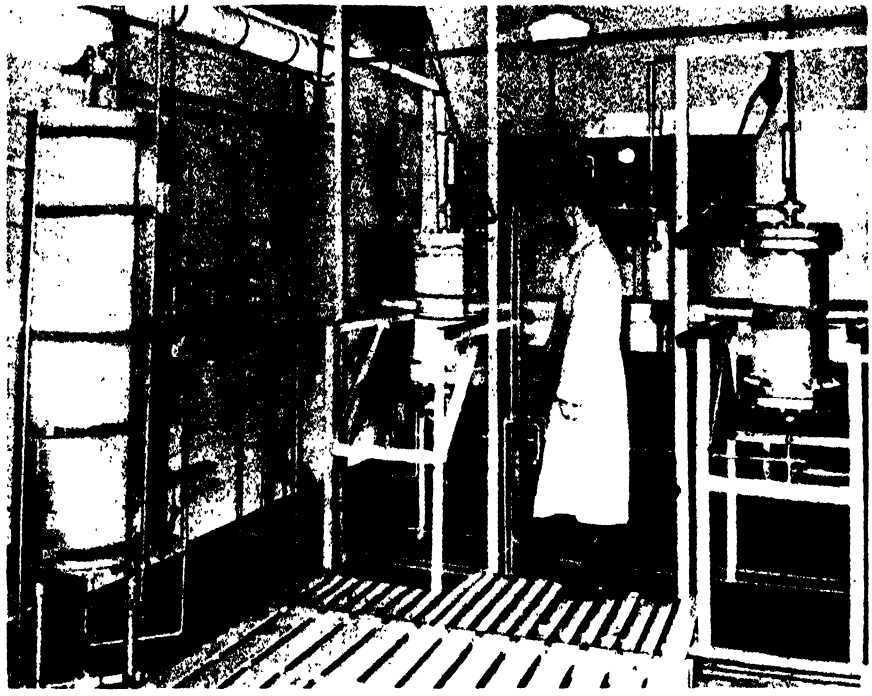
The growing surpluses of raw cotton and the increasing carry-over have constituted one of the cotton industry's most serious problems, and consequently studies on the fiber have received most attention. While new uses for large quantities of cotton are urgently needed, it has been apparent that the adaptation of the fiber to present-day industrial and domestic requirements is also necessary if cotton is to retain traditional outlets. Conditions growing out of the war have momentarily distorted the normal economics, but, at the same time, have emphasized the lack of processing methods by which cotton can be modified and made available where shortages of other fibers are being encountered. Under this stimulation efforts to alter the creasing tendency and inherent harshness of cotton have been intensified. The characteristic structure of the fiber and the chemical nature of cellulose impose strong limitations on the manner in which this objective can be attained. Despite the difficulties, however, encouraging progress has been made. A study of the plasticity of cotton has also been undertaken.

The development over the past three years of a strong cotton tire cord of long flex-life and low susceptibility to heat and moisture for use in heavy-duty pneumatics culminated in the release by the Cotton Research Foundation of complete processing details to industry. A number of major companies have signed the very liberal agreement offered by the foundation.

Investigations on the practicability and on methods of adapting virgin cotton to the manufacture of high-grade papers have been continued. Some of the factors involved in the hydration, fibrillation, and sheet-strength development of all-cotton pulps have been examined in detail. In addition, the effects of pulp pretreatment, cuprammonium viscosity, and beater supplements have been examined and their relationships to sheet properties have been sought. The results of this work are being made available to the paper industry through articles already published or in preparation.

The possibility of a shortage of cotton linters for chemical purposes brought into relief the problem of converting cotton lint into a form suitable for industrial use. The long fiber presents serious difficulties in large-scale manipulation and some

Below. Evaluation of the quality of yeast by baking tests. *Left.* Part of the unit plant of the multiple fellowship on yeast technology.



method of cutting or shortening such fiber is essential. Most of the available mechanical devices are either too inefficient where applied to cotton or so small in capacity as to make them inadequate. The studies now in progress may contribute to a solution to this conversion problem and also assist in the production from lint of cotton pulps to supplement rag stock for paper manufacture.

Fundamental research on the properties and structure of cotton cellulose and on the influence of such processes as mercerization is being conducted by novel techniques. From the kinetics of hydrolysis in a catalyzed system, new knowledge of the submicroscopic structure of cottons is being obtained. Observations made through the hydrolysis-catalytic oxidation method have been supplemented with studies on moisture regain behavior. Together these investigations are shedding new light on fiber structure and property relations. Technical reports embodying the experimental details and conclusions have appeared in the literature.

Research on cottonseed began to mature in encouraging fashion during the past year. It was shown that the cooking process generally employed in the preparation of cottonseed meats prior to oil expression has two effects on the nutritional properties of the finished meal. One, a reduction in toxicity, improves the meal, but the other, the action of heat on the protein, is deleterious. Progress has been made toward a method by which toxicity can be reduced to a minimum without the usual nutritional losses caused by heat. A direct test of its efficacy has been obtained through rat-growth studies. The literature on solvent extraction of cottonseed oil was reviewed and supplemented with new data. A complete analysis of the principal protein, globulin, isolated from solvent-extracted cottonseed meal, has been made to determine the types and quantities of amino acids; this analysis, supplemented with feeding experiments, has been published. Other investigations have dealt with the phospholipids of cottonseed; it has been shown that the lecithin and cephalin constituents are markedly different in character from the preparations now available commercially and therefore may have unique values. Further studies of cottonseed enzymes have contributed to explaining the behavior of lipase during seed storage.

Research on hulls has proceeded with the finding that activated hull carbon retains its absorbency in the presence of adhesives and therefore can be converted to pellet form. The sweeping compound previously developed from hulls is being marketed in appreciable quantities.

H. S. Olcott and T. D. Fontaine, formerly with the fellowship, transferred to positions with the U. S. Regional Research Laboratories in Albany, Calif., and New Orleans, La., respectively.

Experimental glue cookers, multiple fellowship on bone products

Achievements in the Quest for Superior Wool. Since 1939 the fellowship of the Albany Felt Co. under R. R. Fulton has succeeded in devising methods which impart to paper-machine felts and other woolen industrial fabrics markedly improved physical characteristics and resistance to chemical injury. The fellowship has also worked out a process for rendering wool and wool fabrics nonshrinking and nonfelting, and an improved system of wool scouring and scouring-room control that has brought an average daily increase in production of better than 75 per cent and more uniformly scoured, cleaner, loftier wool, without alkali damage. Another contribution of this broad research is an apparatus for the determination in 20 minutes of moisture and residual grease in scoured wool.

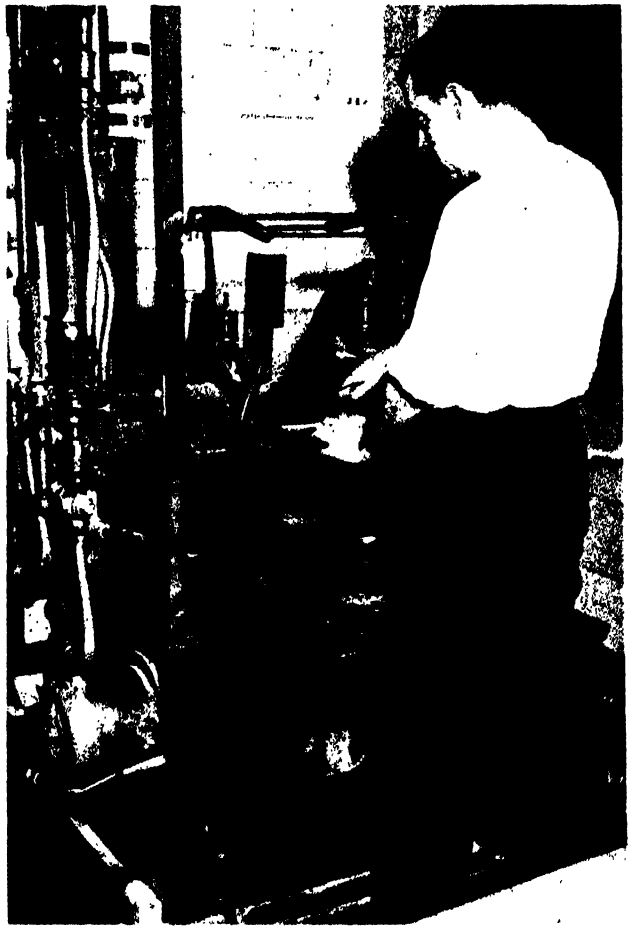
Well-Knit Hosiery Research. The fellowship of the Grove Silk Co., of which R. F. Stuewer is the incumbent, has made important advances in the throwing of hosiery yarn, particularly nylon. Several patent applications have been filed covering these new developments.

Raising Bone Products in Rank. The multiple fellowship of Baugh and Sons Co. (E. P. Barrett, senior fellow) has been quite busy during the past several years. New cookers for the production of glue from bone were installed at the donor's Philadelphia works. The design and operating procedure therefor were based on data obtained over a two-year period in the fellowship's pilot plant at the institute and on industrial scale experiments at Philadelphia in which the fellowship participated. The investigation brought methods for obtaining higher yields and grades of glue and for reducing production costs.

The principal project during 1941 has been a study of granular adsorbents for use in sugar refining. This research, still in progress, indicates that it may be possible to manufacture adsorbents having improved properties at a cost comparable to or lower than that of bone char.

Expansion of Rubber Program. The Firestone Tire and Rubber Co.'s fellowship, led by R. C. Briant, has been carrying on for about four years fundamental studies of underlying problems of the rubber industry. Because of the prime importance of rubber technology in the national emergency, the research is being increased through the employment of additional personnel. The Firestone Co. has collaborated with the fellowship of the Cotton Research Foundation in making practical trials of tire-cord developments.

Raolin Production and Applications. The Raolin fellowship has been establishing commercial production [see NEWS EDITION, 19, 399–400 (1941)] and looking after certain specialized commercial uses for the Raolin resins. In cooperation with Binney & Smith Co. information has been acquired on solvents and plasticizers for chlorinated rubber. During several preceding years the fellowship developed a



composition for employment in the manufacture of coated paper for container closure linings and devoted considerable time to gaining a suitable method of application to ensure the production of a high-grade material. During 1941 this process was carried to commercial application. The Raolin coating used for the production of this specialty paper gives a film that is translucent, colorless, tasteless, odorless, and nontoxic. It has been widely tested and has been found suitable for employment in closures on a wide variety of containers for pharmaceuticals, cosmetics, food products, beverages, and other packaged goods. This coating is resistant to mineral and vegetable oils, aqueous acids and alkalies, alcohols, peroxides and oxidizing agents, aliphatic hydrocarbons, brines, and water. The moisture transmission rate of the film is unusually low. For water and water vapor the rate at 100° F. and 5 per cent relative humidity is below 0.004 gram per sq. cm. per day. The finished product has been made available in bonded strip form or as punched liners.

A factory is operating under The Raolin Corp. patents. Early in October, however, defense requirements of chlorinated rubber had greatly exceeded domestic production, and, as a result, chlorinated rubber was placed under priority control and the entire Raolin output has since been allocated according to federal government instructions. To assist in meeting the Nation's needs, a substantial plant expansion program is under way. J. W. Raynolds, president of The Raolin Corp., is the holder of the fellowship.

Defining the Architecture of Silicon Polymers. The multiple fellowship of the Corning Glass Works (R. R. McGregor, senior fellow) is engaged in research on polymerizable silicon compounds. Consideration has been given to theoretical aspects, such as mechanism of polymerization, structure of the polymers, and molecular size. The chemical features of silicon and of carbon have often been compared, but the study of the silicon compounds has been on such a limited scale that data for fruitful discussion have been lacking. The investigations of this group are bringing to view points of similarity and dissimilarity with carbon which should be helpful in clarifying the problems. The uses of these silicon polymers are many and varied; certain applications have been proposed which have potential utility in warfare.

Novel Plastic Functioning Parts for Meters. The Pittsburgh Equitable Meter Co.'s fellowship headed by R. L. Wakeman has completed a survey of the heat resistance and long-term dimensional stability of a wide variety of plastics and has made a careful study of ways in which distortion under heat, swelling upon prolonged immersion in boiling water, thermal expansion, and impact strength of certain classes of plastics are related to compound formulation. Some of the information obtained during the course of this investigation has been published. Satisfactory performance of the functioning disk of hot-water meters exacts careful balancing of these properties with which operating conditions have been correlated. As a result of this research several plastic materials, both molded and laminated, have been developed which have shown excellent performance in service tests in boiling water for many months. Other products have been evolved for service in meters normally operating at atmospheric temperature but occasionally subjected to hot water. The work carried out in this field has led to the acquisition of data which are proving valuable in the selection of materials to take the place of rubber in meter parts where such replacement is necessitated by current exigencies.

The study of the application of plastics in water meters has been extended to other meter parts and to several types of water meters. Research on materials to use instead of leather in gas-meter diaphragms has led to a new category of resinous product, highly resistant to both aliphatic and aromatic hydrocarbons. Gas-meter diaphragms possessing high flexibility and low resilience have been fabricated from several materials of this novel class by suitable formulation and application to cloth. Such diaphragms have been given laboratory and field tests with satisfactory results; they are now being developed on a semicommercial scale. The utility of this class of resin in other fields is also being investigated.

A step in compounding Buna S in a rubber mill

Industrial Hygiene Foundation in Wartime

Battle lines in today's wars advance and retreat with production. The protection of industrial workers, who are forging the weapons, therefore becomes a supreme necessity, riveting attention on their health as never before in history. And rightly so, for increasing production tends to increase health hazards in industry. Unless successful remedies are swiftly applied, approximately 1,000,000,000 man-hours will be lost through illness in this critical year when production means protection. Public recognition of this fact is perhaps indicated by the more than 140 bills relating to occupational diseases introduced in state legislatures and in Congress during 1941.

Industrial Hygiene Foundation, a combined research and service association for health protection in industry, which maintains its headquarters at Mellon Institute, has continually warned of this urgency, which now becomes self-evident. Accordingly the foundation has been progressively active during the past year, both in its medical and engineering research on industrial health and in its services to affiliated companies. In fact the expansion of industrial health and its own growing work in this field caused the organization to change its name during the past year from Air Hygiene Foundation to Industrial Hygiene Foundation.

Medical Research. L. U. Gardner, director of the Saranac Laboratory, after

studying the effects of arc-welding fumes on susceptibility to tuberculosis, has reported as follows:

As an example of an exposure to a pulmonary irritant that has had no significant effects upon superimposed tuberculous infection, there will be cited an experiment dealing with exposure to arc-welding fumes. This was undertaken because of the increasing number of men being exposed to such fumes throughout industry. The program was carried out under a grant from the Industrial Hygiene Foundation.

The results thus far observed constitute evidence for the view that severe inflammation of the lungs does not necessarily influence the course of a tuberculous infection. They also indicate that exposure to even excessive concentrations of arc-welding fumes is unlikely to have a bad effect upon either fresh or old tuberculous foci (area) in a worker's lungs.

Research has been pursued under Eliot Clark and D. E. Haagensen, at the University of Pennsylvania, on the reactions of living tissues to silica granules as observed microscopically in the rabbit's ear chamber. There follows a summary of the findings.

The study has been extended to include the effect of a more massive dose of silica and also the effect of a second dose superimposed on the single one used in earlier observations. With silica of particle size 1 to 3 microns from material provided by L. U. Gardner a very massive dose was forced into the tissue in a chamber which had been previously subjected to a moderate dose. The chamber was then observed for 10 months. The results did not differ materially from those obtained from the smaller single doses. No definite silicotic nodules were formed.

The outstanding reaction was the phagocytosis (engulfing) of the silica particles by macrophages (wandering cells), which remained visible, with their enclosed silica, throughout the period of observation, and which showed a definite tendency to group together. Some of the macrophages merged to form giant cells which, after days or weeks, disintegrated without causing any noticeable reaction. Evidence has accumulated which suggests that in regions where many silica-laden macrophages are grouped, there is more ready reaction to mild inflammatory irritants than elsewhere. The general conclusion from all these studies is that the presence in the tissues of large amounts of fine silica does not of itself lead to the formation of silicotic nodules, but that it may produce a condition which may form the basis for an exaggerated reaction to mild inflammatory irritants.

Another foundation-supported research at the University of Pennsylvania has dealt with an evaluation of the various x-ray films for use in physical examinations in industry. This investigation, directed by E. P. Pendergrass, assisted by S. R. Warren, Jr., and D. E. Haagensen, and which will be published in full in the foundation's medical series, is given in abstract here.

Research on plastic disks for water meters

Single 14- by 17-inch roentgenograms on film and on paper and stereoscopic 4- by 5-inch and 35-mm. photographs of the fluorescent screen image were made during the summer of 1941 by Haagensen of patients chosen by Pendergrass. The subjects included a few patients whose chests were normal and many others whose chest films provided difficult diagnostic problems. After the films had been produced they were shown by Haagensen to 31 roentgenologists in Philadelphia, Washington, New York, and Cincinnati. Preliminary analyses show that those roentgenologists believe that the order of merit for survey work of the four methods is: (1) 14- by 17-inch films; (2) 14- by 17-inch paper; (3) stereoscopic 4- by 5-inch photographs of the fluorescent screen image; (4) stereoscopic 35-mm. photographs of the fluorescent screen image.

Engineering Research. Philip Drinker, of Harvard University, chairman of the foundation's preventive engineering committee, has told about foundation-sustained studies on welding.

The welding investigation at the Harvard School of Public Health has been completed and the results published. The minutes of the 1940 meeting of the foundation outlined the studies. In the final paper, however, practical details in regard to ventilation were given very fully. It will be recalled that the fellowship incumbent was B. D. Tebbens. At the request of the division of labor standards of the Federal Department of Labor, A. G. Cranch and Drinker cooperated with the government in preparing a brief illustrated pamphlet entitled "Control of Welding Hazards in Defense Industries", Special Bulletin No. 5. Without the help of the work done by Tebbens, this publication could not have contained the information needed in practice.

An item which has been of considerable aid in solving this welding problem is the table of recommended exhaust ventilation rates as follows:

Steel Electrodes (In.)	Exhaust Ventilation Rate in Cu. Ft. per Min. per Welder
5/32	250
3/16	400
1/4	700
5/16	1,200
3/8	1,500
Alloy electrodes (fluoride-coated):	
5/32 inch or less	250
Galvanized plate:	
5/32 inch	1,000-1,500

Another engineering study, in progress at the University of Pennsylvania, on the evaluation of present exhaust ventilation for the control of industrial health hazards, is being conducted by R. H. Walpole, Jr., under the supervision of T. F. Hatch.

Two important situations stand out with respect to the present procedures in designing systems of exhaust ventilation: (1) the design is almost entirely empirical; (2) the performance of systems so designed has not been extensively correlated with the degree of control which is produced. There is need for collection and tabulation of design data, the use of which will provide for more exact control of dusts, fumes, vapors, and gases * * * Recognizing the importance of the variable factors involved and the reliance which must be placed upon previous experience, it seems proper to inquire to what extent empirical data, based upon experience, can be translated into more basic data which will have more general application. One may also investigate the possibilities of reducing power consumption without sacrificing efficiency of control.

Dust and other contaminants are dispersed into the air by definite forces. The function of an exhaust hood is to establish counterforces which will prevent the escape of the contaminant. In a basic engineering approach to the design

of exhaust hoods, the forces of dispersion must be recognized and evaluated and related to hood performance. The major objective of the investigation is to establish such relationships. It is recognized, however, that many problems cannot be solved in this way and, also, that only a few of all the processes requiring ventilation can be studied. A general revision of design procedures and the complete elimination of empirical data are not anticipated. The development of a method of research will, in itself, be of value. Recent literature on exhaust ventilation has been collected and a bibliography, arranged by industry or process, is available in the proceedings of the foundation's sixth annual meeting.

An Audit of Sick Absences. W. M. Gafafer, senior statistician, U. S. Public Health Service, has set forth a brief account of the foundation's study of sick absenteeism in industry, a project started early in 1941.

In 1940 a number of member companies of the foundation, recognizing the extraordinary part played in the industrial economy by nonoccupational sickness and injuries, expressed interest in a study of sick absenteeism in cooperation with the foundation, the American Association of Industrial Physicians and Surgeons, and the U. S. Public Health Service. This action culminated in the periodic reporting to the foundation by 13 companies of pertinent data on sickness and nonindustrial injuries disabling for 8 consecutive calendar days or longer. It is purposed to present here some of the material yielded by the 6 months' period, January to June 1941. (Several other companies plan to participate, but have been delayed by emergency conditions.) Of the 13 participating companies, 8 reported throughout the 6 months, while 5 reported from 2 to 5 months.

The 8 companies, represented by an average monthly number of 42,884 male and 1,656 female employees, yielded 1,899 and 99 beginning absences, respectively, or an average annual male frequency of 89.3 cases per 1,000 and a female frequency of 120.6 cases per 1,000. The male frequency rate is about 80 per cent of the Public Health service rates, the difference reflecting principally the respiratory group of diseases. With regard to days lost, 7 of the 8 companies supplying data on the closing of nonended cases showed a loss of 51,126 days among the males. Company rates varied from 1.69 to 3.39 days per male per year, the latter rate approximating the median rate of 3.33 days experienced by companies reporting to the Public Health Service for 1935–37. It may be safely assumed that the rates as given do not present an overstatement of the sick absenteeism situation as measured in terms of 8 days or longer absences. (One company's rate was well above the average for the others and three times higher than one. An analysis showed that two thirds of this company's large total rate was caused by respiratory diseases. Hence the study reveals the main cause of the absences and this fact enables the company to take intelligent corrective steps.)

Industry is now well aware that sick absenteeism is one of the most serious bottlenecks in the production program. This report gives an indication of the magnitude of the problem in a sample of member companies of the foundation. With respect to the large numbers of new employees, night work, and overtime with its attendant fatigue, sufficient evidence has accumulated which points to an expected substantial increase in the frequency of sick absences.

In considering economic losses involved in sick absenteeism, Andrew Fletcher, vice president and treasurer, St. Joseph Lead Co., has submitted data for his firm, the largest miner of lead ores and one of the outstanding zinc producers in the United States. It has been found that only about 6 per cent of the company's absenteeism results from accidents at work, which Fletcher explains as follows:

Even though the time lost through accidents is only about 6 per cent of the total absenteeism, we cannot estimate the total absenteeism loss by multiplying the accident percentage by some fixed amount, because all operating men know that even under normal conditions there will be sickness and that therefore extra men are carried on the payroll to ensure reasonably normal operations. The direct loss of absenteeism is the amount of wages paid these extra men—just as the direct loss of accidents is the compensation and medical cost. It may therefore be reasonably assumed that in our operations possibly 2 per cent extra men are being carried; with a force of 5,000 men, there are possibly 100 extra men whose annual earnings would approximate $180,000. This figure may be considered as the "direct" loss. The "indirect" absenteeism losses are probably as great as for accidents, especially because a man works efficiently up to the time of an accident, whereas, in the case of sickness, a full day's work is probably not done before an employee is forced to lay off or just after he returns. Assuming the indirect cost of three times the direct, the sick and miscellaneous absenteeism in our operations might approximate $540,000, which with the direct loss makes a total of $720,000. It must be appreciated, however, that, no matter what precautions are taken, there will be some sickness and miscellaneous absenteeism, possibly 50 per cent. Therefore the amount that can reasonably be expected to be saved is $360,000, or about $70 per employee in a force of 5,000. If, therefore, you wish to approximate the absenteeism loss in the United States, or in your own plant, multiply the number of workers by $70 per year.

A rough approximation of the production loss can be determined on the following basis: each worker in the United States loses about 8 days per year—if we can save 50 per cent or 4 days, we save 32 hours per worker; with about 7,000,000 persons in defense industries, we would save about 200,000,000 hours of labor, which is sufficient to build 100 destroyers, or about 300 standard cargo ships.

A Study of Fatigue. R. R. Sayers, director, U. S. Bureau of Mines, and a member of the foundation's medical committee, has prepared for the organization a report on "Findings from Major Studies of Fatigue". This comprehensive analysis, especially timely in the face of labor problems, may be issued as a special bulletin in the medical series. It concludes with 38 points, some of which are:

Data on fatigue and health show the connection between fatigue and loss of working efficiency and increased accident occurrence, but there is little actual medical proof that long, fatiguing periods of work permanently affect efficiency, health, or working capacity.

Causes of fatigue may be physical or psychological. Apparently psychological and environmental factors are far more important causes of fatigue than physiological factors.

Physical manifestations of fatigue include ill health, accident proneness, and inefficiency at work.

Accidents in industries of the United States cause a loss of approximately 1,500,000,000 man-hours of production each year. If the statement is true that illness causes 15 to 20 times as many cases of absenteeism and about 7 times as much loss of time from work as accidents, the seriousness of the health problem in industry is apparent. As ill health is associated frequently with accidents, a health program in industry would seem at least as important as the safety program that has been stressed so strongly in recent years.

Chemical changes in muscle during contraction come from certain substances that depress or inhibit the power of contraction. These fatigue substances consist of the known products of muscular metabolism.

The rate of oxygen consumption of the body during exercise varies almost directly with the amount of external work performed. A man's maximum working power is determined not only by the functional capacity of his skeletal muscles but also by the supply of oxygen to the muscles, heart, and brain. The supply of oxygen is the limiting factor. The total oxygen consumption during exercise is roughly proportionate to the mass of active muscles.

Increase in employment in the defense industries of the United States may mean an increase in industrial accidents and illness, as untrained workers are more prone to suffer accidents and occupational diseases than are the trained. During 1940, with an increase of 2 or 3 per cent in total employment, there was an increase in deaths from occupational accidents of 10 per cent, although in some industries the rate was the same or even reduced somewhat.

The question "What is the optimum number of hours of work?" has not been answered satisfactorily.

The influence of fatigue on efficiency may be judged by the effect of rest pauses on the output of workers. In some instances production was 10 per cent greater during the month when workers were made to stop work for four 10-minute periods during the working day.

A solution of the problems of providing enough man power for industrial and military purposes has been suggested by an experiment in South Africa in physical training of unemployed boys and young men between the ages of 16 and 21 who were in a low state of physical fitness and unable to find employment. The results of this experiment led to the recommendation by the investigators that physical training be compulsory and that in the future clearly defined standards of physical efficiency similar to the intellectual standards be required.

Legal Developments. T. C. Waters, general counsel, discussing the question of compensation for tuberculosis as an industrial disease, has said:

Tuberculosis is not an occupational dis-

ease within the legal definitions of that term that have been incorporated into our statutes and announced by judicial decision. There should be no qualification of this conclusion except as to those cases where tuberculosis is superimposed upon a traumatic injury or other compensable disease or in cases where nurses or attendants of tubercular patients contract the disease. In view of the fact that in certain instances tuberculosis has been held to be compensable, either as an occupational disease or as an accidental injury, and the further fact that employers may be faced with common law litigation involving claims for tuberculosis injuries, it may be well for industry to give cautious consideration to the possible compensation of such injuries as if tuberculosis were a compensable occupational disease. Legislation providing compensation for tuberculosis will probably present more perplexing problems than that for any of the diseases now considered occupational and, if such legislation is to be enacted, it should be surrounded by certain safeguards.

J. D. Dorsett, Association of Casualty and Surety Executives, also a member of the foundation's legal committee, has considered various bills introduced in the legislatures and in congress during the past year.

It is gratifying to see that the trend, as far as actual enactments are concerned, seems to be toward well-considered legislation. Including the law recently enacted in Utah, there are now 25 states and the District of Columbia in which compensation is granted for occupational diseases in some form. Of these we find that 14 first enacted legislation on this subject since 1935. Enactment of similar laws in the remaining states is to be expected, probably in the near future It also seems likely that some states already having such laws will revise them in the light of added experience. In some cases, particularly among the earlier laws, sufficient knowledge was lacking to permit the enactment of a well-rounded program of occupational disease compensation. Today, it is felt, mistakes of the past can and should be avoided. Organizations such as the Industrial Hygiene Foundation, in broadening our knowledge in this field, are doing a great deal in accomplishing this end. Under proper laws, industry is less likely to be saddled with claims for which it should not be responsible; at the same time, the workman receives compensation for disabilities attributable to the hazards of his employment. But, even more important than compensation, attention is directed to prevention.

Interesting Features of the Foundation's Sixth Annual Meeting. D. W. Crombie and J. L. Blaisdell, of the Queen Alexandra Sanitorium, London, Ontario, reviewed their work on "Aluminum Powder as a Possible Preventive in Silicosis" at the sixth annual meeting at Mellon Institute, November 12 and 13, 1941. The foundation has had no direct part but is much interested in this investigation. A. J. Lanza, chairman of the medical committee, led a group of foundation representatives and other specialists who visited the Canadian scientists last summer to gain a first-hand acquaintance with the research. In relating their experimental work at the foundation's meeting, Crombie and Blaisdell said in part:

A preliminary report is made of the results obtained to date in the treatment of 14 cases of human silicosis by inhalation of metallic aluminum dust over periods varying up to about one year. Of these 14 cases, the two having received the least amount of treatment remain unchanged; two others perhaps show slight improvement, while 10 would appear to have derived some definite benefit from this form of therapy.

Particular emphasis must be directed to the fact that the original investigators, Denny, Robson, and Irwin, proposed the use of metallic aluminum dust only as a possible means of preventing silicosis in conjunction with the usual methods of dust control. Our own investigation thus far has been concerned entirely with the possible curative or alleviating action of aluminum. In thus treating cases of already-established silicosis, some of which are of long duration, we have put aluminum dust to a critical and severe test. Even if further investigation should show that permanent benefit may not result from aluminum treatment in already well-established cases, the potential value of aluminum as a preventive will not be thus discredited. We feel, however, that the results so far obtained are definitely encouraging and would suggest that a certain number of silicotics are benefited by aluminum treatment.

Although further investigation may fully substantiate our present feeling that aluminum may benefit silicotic subjects or conceivably arrest the further development of the disease, it will not restore fibrous replacement of lung structure which, as far as we know, is an irreversible transformation. The chief value of aluminum will be in the prevention rather than in the alleviation of silicosis. At present a most conservative attitude toward this work must be adopted. The widespread application of aluminum inhalation in industry is as yet unwarranted; it may be advised and undertaken only as the result of further and more conclusive observations.

Workman, preparing to sandblast magnesium castings, is protected from dangerous dust by an air-supplied helmet. The operation is confined to a tight chamber which segregates the dust from other workers.

C. E. Ralston, safety director, Pittsburgh Plate Glass Co., and chairman of the membership committee, reported that more than a dozen companies affiliated with the foundation during the past year, bringing the total membership to approximately 240 companies. In addition, a score of state and federal agencies are subscribing to foundation publications, including the monthly *Industrial Hygiene Digest*, which condenses world-literature on industrial health.

H. B. Meller, managing director, announced that in attempting to fulfill its function—keeping health precautions in step with production—the foundation is performing more and more field work for members. More than 20 such surveys were made during the year in chemical, metal, glass, refractories, and related factories scattered through seven states. Three member companies utilize the survey service on a year-round basis.

Audits of sick absences and industrial hygiene surveys are practical procedures of the first magnitude for industrial concerns today and tomorrow in conserving America's man power and in utilizing satisfactorily their personnel in manufacturing military and other matériel.

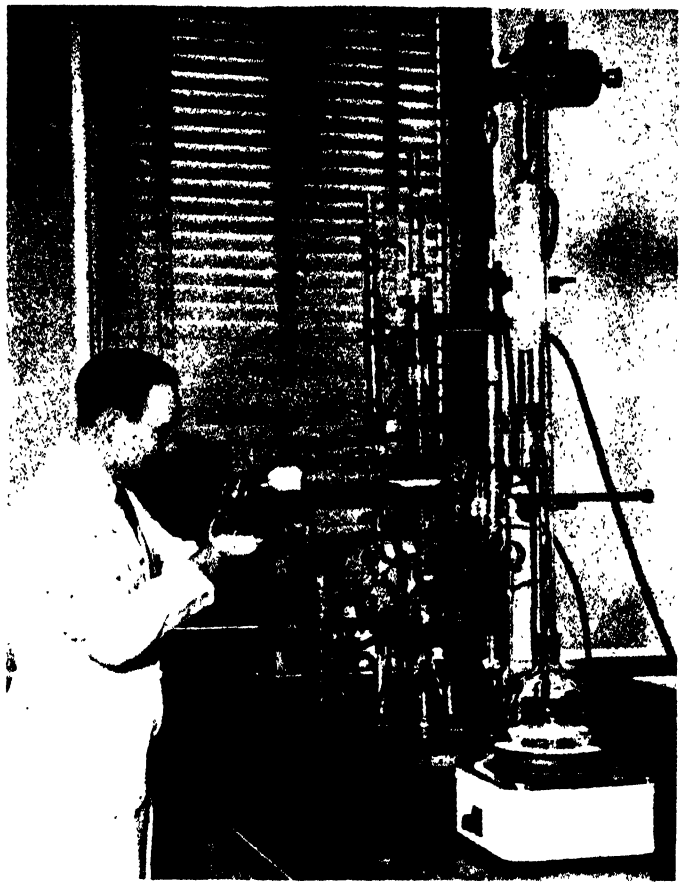
The Institute's Department of Research in Pure Chemistry

Investigations in Chemotherapy. Studies on the chemistry and chemotherapy of modified cinchona alkaloids and related synthetics have been continued by L. H. Cretcher, the department head, and his staff and their medical associates.

In the experience to date there has been found no beneficial action of quinine which cannot be accomplished equally well by hydroxyethylapocupreine, a drug which is greatly superior to quinine in pneumonia, in infections of the eye and throat, and in certain asthmatic conditions. The reports of Hegner (1941) on its effective use against bird malaria are most relevant. The drug was tested on three species of malaria parasites in three species of hosts. It has also been employed successfully in human malaria (W. W. G. Maclachlan and associates). Experimental clinical studies on malaria are being made at present in the tropics, and the results are awaited with interest. Much time has been devoted to research on the process for the production of this drug that its yield from quinine shall be the highest possible with consequent lowering of cost. The findings have been gratifying.

A general study has been made of the process of hydroxyethylation of phenolic compounds. Two new reagents have been

developed, one of which is especially effectual in the alkylation of phenols containing tertiary nitrogen atoms. Further attention to sulfonic acid derivatives of the alkaloids has led to the discovery of an interesting relationship between chemical configuration and the susceptibility of the various cinchona compounds to sulfonation.



Within the past several years there has occurred a growing recognition of the social and economic importance of better control of the millions of malarial cases throughout the world. Added thereto is the significant military consideration of maintaining the health of troops occupying malaria-infested regions. In line with attempts to prepare better antimalarials, a continued study of the literature has been conducted with the view of summarizing knowledge of the relationship between chemical structure and antimalarial activity (W. W. Carlson).

Researches on sulfur-containing cinchona alkaloids have been carried forward. A series of ethers of 6'-(beta-thiolethyl) apocupreine has been prepared and tested biologically, and the results are embodied in a published paper. All the members of the group prepared exhibit bacteriostatic power against the pneumococcus, but none is superior to hydroxyethylapocupreine. The study has led, however, to an interesting observation which may act as a guide in future investigation, because the ultimate object of these chemotherapeutic researches may be regarded as the elucidation of definite methods whereby the toxicity of a type structure may be diminished while retaining or enhancing its bacteriostatic power.

It has been found that increasing the length of the aliphatic side chain at position 6' gives a graded increase in solubility in certain organic solvents and is accompanied by a corresponding progressive increase in bacteriostatic activity and toxicity to mice.

Ethylapocupreine and beta-chloroethylapocupreine have been shown to be equally toxic and to possess practically identical bacteriostatic power both *in vitro* and *in vivo*, the introduction of the chlorine being practically without effect. Substitution, however, of the hydroxyl group for the chlorine profoundly reduces the toxicity without greatly diminishing the bactericidal power. The effect of substitutions, such as by iodine and various other elements and radicals, is being studied (R. S. Tipson).

A paper describing the preparation and properties, both chemical and biological, of quaternary salts of cinchona alkaloids has come out (Mary Clapp and Alice Renfrew). The compounds are not of practical value. Reactions of 10-iodo- and 10-bromohydroquinine are under investigation (Renfrew and Clapp). The study of 6'-apocinchonidine derivatives has been continued (Carlson and Renfrew).

Extraction and desiccation of beta-chloroethylapocupreine

Because of the possible difficulty in obtaining adequate supplies of cinchona alkaloids, investigations are under way aimed at the production of simpler heterocyclic compounds which can be made from easily available materials. It is hoped that therapeutically active compounds can be prepared by the application of knowledge of the structural and biological relationships obtaining in the cinchona field (Renfrew).

Close collaboration with the clinical and bacteriological groups has been maintained through the year, and a number of new chemicals have been investigated. Further clinical studies on hydroxyethylapocupreine have been performed; they will be described later, supplementing a statistical inquiry which began in 1935.

Studies for the United States Pharmacopoeia, 12th Revision. Final action of the medical members of the Committee of Revision on the Admission of New Synthetic Organic Chemicals having been delayed until well into 1941, the past few months have been devoted largely to the evaluation of different assay procedures for these drugs (G. D. Beal and Elinor Sackter). For instance, agreement has been reached on a rapid and accurate diazo titration for standardizing certain official aromatic compounds containing a primary amino group. And it has been necessary to choose by experiment among several methods for the determination of organically combined mercury in the presence of such purine derivatives as theophylline. In the analysis of the mercurial diuretics it has been found that either wet combustion with sulfuric and nitric acids followed by titration with a thiocyanate or gravimetric determination of the sulfide precipitated directly from a solution of the drug is simple and accurate.

The introduction into the Pharmacopoeia of a large number of solutions for parenteral administration, which must be packaged sterilely in small containers, the majority of which hold unit doses, has compelled the recognition of procedures for the quick determination of chemical durability. With the collaboration of leading members of the Glass Division of the American Ceramic Society and of the Joint Contact Committee of the American Drug Manufacturers' Association and the American Pharmaceutical Manufacturers' Association, a selection has been made of chemical methods of analysis that will ensure the choice of containers of excellent quality from the standpoint of solubility. A series of long-range experiments is being planned to ascertain the individual glass requirements of pharmaceutical solutions. The same principles are being applied to the selection of containers for chemicals that are known or thought to be sensitive to light.

Research at The Western Pennsylvania Hospital

Chemotherapeutic and bacteriologic studies in the Institute of Pathology of The Western Pennsylvania Hospital by R. R. Mellon and his staff have been concerned largely with the elucidation of the effects of the sulfonamides on the tissues of the host and on the infecting agents in the tissues. These projects are subsidized by Mellon Institute as recommended by C. B. Schildecker.

Demonstrated local action of sulfanilamide in clean wounds and of sulfathiazole in local infections supported the theory

that these compounds stimulated and detoxified the tissues. Accordingly tissue culture and tissue respiration experiments have been conducted to obtain verification or denial of this explanation. Briefly it has been found that sulfathiazole, in contrast to sulfanilamide, brings about an increased uptake of oxygen on the part of certain tissues. Sulfanilamide itself has been shown to effect initial restriction of growth, but subsequent and marked differentiation and specialization of tissue cells, which are prominent factors in wound healing. Experiments to extend the knowledge of possible unfavorable clinical consequences of sulfonamide therapy have been continued and detailed reports of the incidence of certain pathologic sequelae have been published. Many compounds have been investigated, resulting in a more rational method of ascertaining the efficacy of drugs used in treating meningitis and in a more precise method for determining the concentration of the sulfanilamide-type of drugs in body fluids.

A new sulfhydryl preparation (Hydrosulphosol) has been found to have value in the treatment of burns. Its ability to stimulate rapid healing of burns and to discourage infection was demonstrated in 150 cases in which it was the treatment of choice. This compound, like the sulfonamides, not only prevents multiplication of bacteria, but also stimulates the antibacterial functions of the tissues themselves.

The fundamental bacteriological research for the year has embraced studies of active and passive immunization in mice by vaccines and serums derived from selected phase-variants. An investigation on the bacteriology of subacute bacterial endocarditis was carried through, with observations on the dissociative behavior of the isolated green streptococci and their resistance to the sulfonamides.

Studies have been continued on natural resistance and the common cold and on the role of certain enzymes involved in the metabolism of oxygen and carbon dioxide. The objective of the latter investigation is to learn something of the possible relation of these enzymes to the underlying metabolic disturbances associated with arthritis. A number of cases of arthritis have been successfully treated during the year.

Industrial Fellowships in Operation at Mellon Institute during the Fiscal Year March 1, 1941, to March 1, 1942

Fellowship Name (with inception year)	Fellows and Assistants
Abrasives (1930)	A. P. Thompson
Acid Recovery (1938)	W. W. Hodge, advisory fellow R. D. Hoak, senior fellow L. L. Friend
Air Pollution Control (1928)	H. B. Meller
Amine (1937)	R. V. Rice H. J. Spoor, from May 8
Anthracite Industries (1937)	H. J. Rose, senior fellow R. C. Johnson Miriam Griffith, assistant W. J. Lace, assistant, from Sept. 30 W. V. Hunt, assistant, from June 9 to Sept. 15 James Bateman, assistant, to June 10
Bone Products (1935)	E. P. Barrett, senior fellow J. R. West R. A. Finkle, assistant, from June 16
Bread (1930)	H. A. Kohman
Calcite Technology (1941)	W. J. Remington, from August 1 Conrad Trost, assistant, from Sept. 1
Carbon Black (1927)	W. J. Remington, to August 1
Ceramic Chemicals (1933)	E. E. Marbaker
Chain and Welding (1936)	D. F. Helm
Chemical Hygiene (1937)	H. F. Smyth, Jr., senior fellow C. P. Carpenter C. B. Shaffer, from June 23 Jane Seaton, assistant Louise Leslie, assistant R. T. Scherer, assistant Diana Dibblee, assistant Matthew Marshall, assistant, from June 9
Cigaret Technology (1932)	C. F. Bailey, senior fellow A. W. Petre
Coke-Plant Construction Materials (1941)	C. F. Pogacar
Commodity Standards (1931)	Jules Labarthe, Jr., senior fellow A. F. Tesi M. S. Morgan E. M. Cohn, assistant
Concrete (1930)	D. R. MacPherson R. S. Powell, assistant, to June 15
Constructional Resins (1939)	P. K. Porter Joseph Miller, assistant
Cork (1937)	E. G. King, senior fellow H. E. Weaver, from October 27 E. R. Frederick, assistant, from December 29 G. H. Eadie, assistant, to November 13
Cotton Foundation (1937)	R. F. Nickerson, senior fellow D. M. Musser J. A. Habrle, assistant, from July 22 J. N. Pattison, assistant, from January 6
Cottonseed Products (1930)	A. W. Harvey, to August 1
Dielectrics (1937)	R. N. Wensel H. J. Homer, assistant
Enamels (1925)	D. G. Bennett
Ethanol (1938)	H. W. Coles W. E. Tournay, assistant, to January 10
Felt (1939)	R. R. Fulton, senior fellow K. H. Slagle, from February 1 W. G. Gapcynski, assistant, to January 1
Food Varieties (1921)	E. R. Harding, senior fellow Helen Wigman L. L. Lachat G. E. Helz, from January 1 W. C. Bell, assistant J. K. Brocklehurst, assistant Daphne Land, assistant, from February 1
Foundry Practice (1940)	W. A. Pennington
Fur (1941)	A. W. Harvey, from August 1
Garment (1929)	T. H. Swan H. C. Donaldson, to January 1
Gartex (1939)	K. J. Miller, to February 15 T. R. Trevorrow, assistant
Gas By-Products (1940)	W. H. Hill, advisory fellow J. H. F. Veltman R. H. Hartigan Jane Moon, assistant, from April 1 T. E. Robbins, assistant, from June 16 Mary Joyce, assistant, from June 16 Dorothy Kibler, assistant, from January 1 R. E. Powers, assistant, to July 15
Gas Purification (1939)	J. A. Shaw, senior fellow G. E. C. Wear, from July 1 R. S. Detrick, assistant
Gypsum (1938)	H. F. Simpson J. R. McKlveen, assistant

Flett to Receive Schoellkopf Gold Medal

To Lawrence H. Flett the Western New York Section of the American Chemical Society will award its Jacob F. Schoellkopf Gold Medal for 1942 during the May 18 meeting of the section at the University of Buffalo. Mr. Flett, a chemist with the National Aniline Division of Allied Chemical & Dye Corp., was chosen as recipient for research on detergents of the higher alkylarylsulfonate type and their application. The award committee also took into consideration his extensive work in dyestuffs and intermediates. One of Mr. Flett's more recent contributions to the pharmaceutical field has been development of an antiseptic for fungus diseases. The medal rewards accomplishment constituting a major advance in science and embodying the spirit of research in industry.

Swift & Co. Fellowship in Nutrition

The University of Wisconsin has received from Swift & Co. a grant for the year 1942 to be used to carry on a study of the significance in normal nutrition of the newer members of the vitamin B complex, especially biotin and the norite eluate factor from liver. This work will be under the direction of E. B. Hart and C. A. Elvehjem of the Department of Biochemistry. Dr. Elvehjem's outstanding discovery of nicotinic acid and its relation to black tongue in dogs and pellagra in human beings have been of great benefit in nutritional research. Dr. Elvehjem received his Ph.D. degree from the University of Wisconsin, where he is now professor of biochemistry. Professor Hart, who studied at the Universities of Michigan, Marburg, and Heidelberg, has been professor of biochemistry at the University of Wisconsin since 1906 and is one of the deans of the modern school of biochemistry.

Warner Co. Makes Research Grants

William R. Warner & Co., Inc., New York, N. Y., has established a two-year fellowship for postgraduate study in the Department of Radiology at the Long Island Medical School, Brooklyn, N. Y., and made the following grants:

To New York University Medical School for 1942, for the study of the conjugation of the sulfonamide drugs. This study will be carried out in the Pneumonia Service of the Harlem Hospital.

To Northwestern University Medical School, Chicago, Ill., for 1942, for the study of toxic factors as observed in the Department of Dermatology. This study will investigate the possibilities of detoxifying therapeutic agents used in the practice of dermatology.

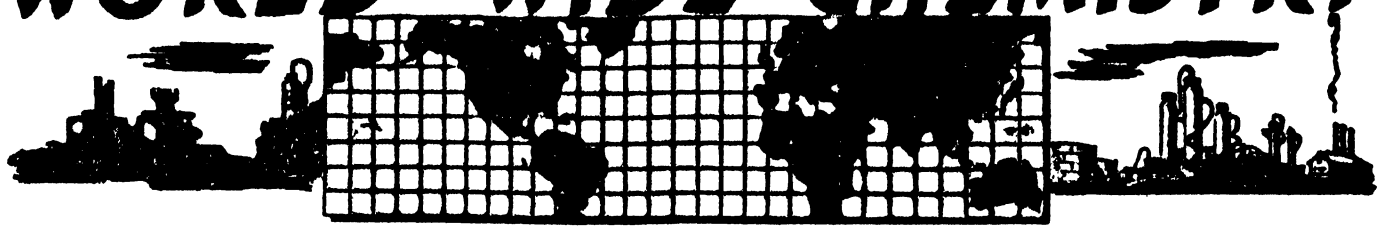
To Washingtonian Hospital, Boston, Mass., for the study of alcoholism. This study will involve the blood chemistry and psychometric findings of cases while under the influence of alcohol and during recovery.

John Wilson has been promoted to the position of production superintendent of the Jessop Steel Co., Washington, Penna.

Severance Pay Fund for Employees

The United States Senate Finance Committee on March 14 was asked to revise the federal tax laws governing corporations to permit the setting up of funds to be used as severance pay for workmen who, at the end of war production activities, will find themselves out of work.

In a letter to United States Senator Bennett Champ Clark, Edgar M. Queeny, president of Monsanto Chemical Co., pointed out that his company would like to establish such a reserve, particularly for the employees of four large new plants which the company will operate for the Government. But, he said, under present tax laws money set aside by stockholders to give severance pay to dislocated employees would be penalized to the extent of 72 per cent, with even higher penalties in prospect.



He suggested that if the tax laws were revised to permit setting up reserves of severance pay funds that such funds could be deposited irrevocably with a trust company, which would act as a third party to see that the money could not be used for any purpose other than severance pay.

Mr. Queeny cited that Monsanto has had a severance wage payment policy for many years so that "when a job is discontinued by reason of process or market change and a man cannot be placed elsewhere or when a man by temperament or other reason becomes unsuited to his job" he can be provided severance pay to help tide him over during the time he is seeking to relocate.

Student Affiliates of the American Chemical Society at Western State College of Colorado, sponsored by R. Schuhmann

WORLD-WIDE CHEMISTRY

Continental Europe

I. G. Farbenindustrie Raises Capital to 900,000,000 Marks

A capital increase to 900,000,000 marks has been announced by I. G. Farbenindustrie A.-G., the German dyes and chemical trust. The capital had been raised to 760,000,000 marks, plus 40,000,000 marks preference shares, during the war and only part of the new shares has so far been issued. An amount of 12,750,000 marks has been handed over to three French dyestuffs producers in payment of the four plants which these companies have sold to the Francolor, the new dyestuffs combine in which I. G. Farbenindustrie is interested. These shares, valued at 160 per cent of the nominal, would be equivalent to a cash payment of 20,400,000 marks. This apparently is about half the estimated value of the French dyestuffs industry, for I. G. Farbenindustrie received 51 per cent of the shares of the Francolor company against payment of 12,750,000 marks of its own shares to the French founders. Its only other contribution was the transfer of certain French dyestuffs patents.

The remaining new shares of I. G. Farbenindustrie have been used for financial purposes, it was announced. In this connection they were valued at 130 per cent of the nominal, so that a substantial profit remained for the buyer of these shares. I. G. Farbenindustrie has played a prominent part in the conversion to German ownership of industrial undertakings in various German-occupied countries, in particular in Poland, Yugoslavia, France, and Belgium, and lately it was reported that the company was interested in new chemical enterprises in Norway.

Nazi National Organization on Chemical Fibers Formed

A new organization called Reichsvereinigung Chemische Fasern has been formed in Germany as a central authority with far-reaching powers for planning production and imports, direction of sales and distribution, fixing and controlling prices of all kinds of synthetic fibers, including rayon, staple fiber, cellwool, and fibers of the type of PeCe and Perlon, the two synthetic I. G. Farbenindustrie products. Several other German firms, experimenting with production of similar synthetic fibers from organic raw materials, are said to have reached a stage where commercial developments can be expected soon. The new Reichsvereinigung will cooperate closely with other continental countries where cellwool and staple fiber factories are being built on German lines The organization is to assist in the exchange of knowledge and experience among individual producers who will have to accept a wide measure of control and official direction.

German Potash Sales Approach Figures for 1940, a Low Year

According to official reports, potash sales by the German syndicate in 1941 approached but did not quite reach the 1940 figures. The year 1940, however, was a bad year for German potash exports. Exports suffered severely from loss of overseas markets owing to the blockade, while sales in Holland and Belgium were seriously hit by military operations and the consequent disorganization of trade. It was hoped that in 1941 an improvement would result from the drive for increased food production and fertilizer consumption in Southeastern Europe and a resumption of larger shipments to the Low Countries, but apparently these hopes have not materialized. Transportation difficulties are known to hold up the delivery of many bulk commodities.

Magnesite Industry in Austria Reports Progress

Austrian magnesite deposits are one of the principal raw materials for metallic magnesium production. During the past year a joint company of Deutsche Magnesit A.-G. and I. G. Farbenindustrie A.-G., called Studiengesellschaft für Metallgewinnung G. m. b. H., has conducted research on production and treatment of magnesium metal. Another recently formed research company, Maerz Ofenbau, Planung, Beratung G. m. b. H., will investigate the use of refractory materials. Magnesite deposits owned by the Oesterreichische Magnesit A.-G. are being worked by Deutsche Magnesit A.-G., which is closely connected with the older company.

Germany Develops Standard Practice for Protection of Magnesium by Paints

Protection of magnesium and magnesium alloys by suitable paints has been studied extensively in Germany, and the standard method evolved is based on the use of zinc chromate as a grounding material. Before this is applied, the surface is prepared by immersion in a solution of either nitric acid and sodium dichromate or hydrofluoric acid (15 to 20 per cent) for 5 minutes, followed by immersion for 45 minutes in 10 per cent sodium or potassium dichromate. Aluminum paints are considered the best finishing paints, especially if small amounts of synthetic resins are added to improve water resistance. A suitable binder for the top coats is phenol resin lacquer with 1 part of linseed oil and 3 parts of tung oil.

Propane Replaces Town Gas in Increasing Amounts in Germany

Propane, produced in increasing quantities as a by-product of synthetic processes in Germany, is being used for lighting and other purposes in place of town gas, particularly in rural districts where town gas cannot be supplied. The gas, which liquefies at −42.2° C. or at higher temperatures under pressure, is transported in steel containers supplying 290 cubic feet of propane gas equivalent in caloric values to 1,625 cubic feet of town gas.

Substitutes for Lubricating Oils from Petroleum Offered

For lubricating machinery and parts exposed to the weather several substitutes are used to replace peacetime lubricating oils from petroleum. Though the alternative materials cannot compare in lubricating properties with the normally used product, they are claimed to have proved passably satisfactory. Residual oils from lignite carbonization are a red to reddish-brown material, translucent, solvent in benzene, free of water and creosote, with a specific gravity above 1.0 (at 20° C.).

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

Their flash point is 175° C. and they solidify at −70° C. Tar fat oils, obtained by distillation from anthracene and other heavy coal-tar oils or from coal-tar itself, are reddish-brown to brown-black and have a specific gravity of 1.1, flash point of 120° C., and solidifying point between −5° and −15° C. They are said to be superior to lignite lubricants. Coal lubricating oils usually contain large amounts of phenolic substances and are, therefore, less suitable. Their flash point varies between 120° and 200° C. All these oils are characterized by high acid and sulfur contents and cannot be used unless changed at frequent intervals.

A lubricant material is also obtained from shale oil by repeated distillation and treatment with sulfuric acid. The intermediate product, green oil, is cooled, pressed, and filtered. It yields after removal of the paraffin the blue oil which is viscous, has a flash point of 160° to 170° C., and solidifies between −10° and −15° C. Finally, use is being made of residual oils from refineries. If these are distilled further, they yield a material with a specific gravity of 1.0 to 1.2, flash point 140° C., solidifying point for summer oil 0° C. and for winter oil 10° to 12° C. Their properties can be improved by mixture with normal lubricating oils and addition of animal oils.

Large-Scale Carbonization May Yield More Motor Fuels

Large-scale plans have been developed in Germany for production of motor spirit, marine fuel oils, and paraffin from lignite carbonization tar. It is said that preparations for systematic development on a greatly increased scale have been made for coal carbonization, and it is hoped that accumulations of residual tar in hydrogenation plants can be used for carbonization. A recent process permits the use of residual tar in conjunction with surface-active culm-coke, and this tar-coke mixture can be easily carbonized with circulation gases.

Germans Use Acrylic Acid Esters for Finishing Textiles

German textile manufacturers, forced by shortage of imported materials to look around for substitutes for finishing, have hit on acrylic acid esters. These esters are transparent, without color or odor, resistant to alkalies, do not absorb more than 2 per cent water, and can be applied in aqueous dispersions or in solutions with organic solvents. They are recommended for use on cellwool fabrics, for stiffening cuffs and collars, as a binder for pigments in textile printing, and for waterproofing brightly colored canvas. It is said materials treated with acrylic acid esters can be washed with water, soap, and soda.

Brewers' Yeast Used for Special Purposes

Waste yeast from breweries, of which some 50,000 tons are produced in Germany, was little used before the war, except for feeding animals. Two years ago experiments were begun on production of a high-grade yeast food for children and invalids. It was hoped then that eventually several big factories would be built in various parts of Germany, but these plans were postponed because construction materials and labor were needed for other purposes. Waste yeast is now used for another but "also very important" purpose which is not specified and in the manufacture of beef extracts.

Swiss Chemical Companies Concentrate on Home Market

Increasing difficulties in export markets have compelled Swiss chemical manufacturers to concentrate on development of the home market, where larger sales are already reported. The coal-tar dyes industry has suffered from shortage of raw materials imported from Germany and France, and efforts are still continued to develop a local raw material basis. Gasworks provide coal tar, and an intermediates production of larger dimensions is a goal. Shortage of raw materials is also reported by manufacturers of copper, chromium, and potash compounds. Pharmaceutical manufacturers send the bulk of their exports to countries on the European Continent. In some isolated cases exporters have used aviation to send high-class products to overseas customers.

Oil Production Program to Be Extended in France

The Société de Combustibles et Carburants Nationaux, formed in March last year with a capital of 20,000,000 francs, has now raised it to 50,000,000 francs. At the same time it was announced that production of synthetic fuel from shale and lignite, originally scheduled to reach 50 tons a day, will be raised to 100 tons a day. An agreement has been concluded between Pechelbronn and the new Société Nationale de Pétroles d'Aquitaine for a regional division of territories in which oil prospecting is to be carried on. D'Aquitaine will concentrate on the region of Lavelanet where the first drilling operations have already been undertaken, while Pechelbronn will work in the district of Languedoc where oil was found in 1925.

Potash to Be Mined in Southern France

As France has lost the potash mines of Alsace, the Compagnie des Mines de Potasse et de Magnesite has begun development work in southwestern France where potash deposits are said to exist. A shaft has been sunk at Boudigot near Landes.

Alsatian Chemical Company Goes under German Control

Société Anonyme pour l'Industrie Chimique, the Alsatian company which produces pharmaceuticals and cosmetics and specializes in synthetic dyestuffs for the Alsatian textile mills, has changed its name to Chemische Werke Dornach G. m. b. H. The company was closely connected with the Kuhlmann interests. It is now under German control, and its capital has been fixed at 2,000,000 marks.

Belgian Chemical Industries Form Central Organization

A central organization of all chemical industries has been formed in Belgium. All firms have been divided into 10 groups according to their sphere of activity, and these 10 will play an important part in the provision and allocation of raw materials which individual firms find difficult to obtain. The central organization will help in the supply of raw materials for chemical products required for the domestic market and cooperate in the development of export markets. In the future the bulk of the export trade will be directed to central Europe, even after the war. The organization is to further cooperation with German chemical manufacturers, many of whom have already acquired financial interests in Belgian firms, but it is difficult to see how this aim can be achieved in present circumstances. The Belgian chemical industry is based largely on two raw material sources, domestic collieries and coke-oven plants which provide tar, ammonia, and benzene and the copper and zinc smelters which supplied sulfuric acid, paint materials, and fertilizers as long as ores and concentrates were imported from overseas. This raw material source has been cut down, while the Belgian coal mines suffer from increased costs. Nevertheless, great efforts have been made under auspices of the German authorities to increase the output of tar and benzene.

Plant to Produce Pepsin Constructed in Denmark

A factory for production of pepsin, lecithin, cholesterol, etc., is being built at Norresundby by the Cooperative Association of Butchers in northern Jutland. It is expected that the new factory will be in operation during the summer. It will use offals from the bigger butchers' yards.

Wartime Change Continues in Norwegian Chemical Industry

Probably no other country used to sell abroad so large a part of its chemical production as did Norway in peacetime. When the country was cut off from its normal markets by the German invasion, many plants found it extremely difficult to adapt themselves to new conditions. Norsk Hydro has been looking for new productions to make use of surplus electric power which before the war was applied to the output of electrochemicals and fertilizers. While these efforts do not yet seem to have led to tangible results, it is reported that Norwegian manufacturers of coal-tar products have been able to expand their output and to commence production of new chemical articles. Crude pyridine, for instance, used to be imported but is now made in Norway. Similarly carbolic acid is manufactured on an increased scale, while coal-tar pitch and distilled tar are used for the production of roofing materials. Road tar is made in larger quantities, and one firm, Nordiske Destillasionsverker, has carried out experiments for the replacement of asphalt by pine pitch. Imports of crude tar have stopped. All requirements must now be met by local gasworks. Fresh outlets are investigated for ammonia, of which there is a surplus, but it seems to be difficult to discover remunerative uses for the material.

New Swedish Company to Manufacture Cellwool

Cellul A. B., the Swedish company which was formed recently to manufacture cellwool, intends to produce 7,500 tons a year. Its factory will be situated near Aelvenäs, 30 miles west of Carlstad, where there are suitable raw material sources. It is reported that the plant will use 8,000 tons of cellulose, 13,500 tons of sulfuric acid and 20,000 tons of sodium hydroxide.

Swedish Manufacturer Expands Chemical Output

Import difficulties have stimulated chemical manufacture in Sweden. A. B. Bofors, one of the largest producers, intends to begin production of aniline and aniline salt. Manufacture of aniline dyestuffs is not intended as economic conditions do not favor such a plan. Extensive experiments have been carried out with toluene products, but the supply of toluene from gasworks would, it is said, have to be augmented by supplies from other sources to make possible commercial production of toluene derivatives. Another new product of the company is nitrobenzene for explosives, soap, cosmetics, and aniline derivatives. Acetanilide is manufactured for medicinal use. Anhydro-*o*-sulfaminebenzoic acid, chloroamine, *o*- and *p*-toluenesulfonic acid are other organic chemicals which A. B. Bofors has recently started making.

Changes in Swedish Sulfuric Acid, Superphosphate Output

Loss of the usual raw material sources has inconvenienced Swedish producers of sulfuric acid and superphosphates, but increased use of domestic raw materials will enable the industry to cover the country's demands. Requirements of sulfuric acid increased last year as a result of larger consumption for the manufacture of cellwool, in wood hydrolysis, and for production of cellulose sulfate, but the output is also reported to have risen. Superphosphate consumption has been curtailed. About 160,000 tons will be required, and these are to be produced from apatite slick supplied by the Swedish iron ore mines. This raw material is preferred to the phosphorite deposits at Närke.

Swedish Interest in Synthetic Rubber Gains

The Industrial Commission has recommended the grant of 25,000 kroner by the government for experiments on synthetic rubber production. Experiments of this kind have been conducted for some time at the Svendberg Institute in Uppsala and various private firms, including Fotfatbolaget, Mo & Domsjö A. B., and Asea, have supported the work financially. According to the report of the Industrial Commission, a product of the type of chlorobutadiene appears to be most promising. Negotiations for the purchase of foreign licenses have been begun.

Shale Oil Production in Sweden Increasing

The Svenska Olje A. B. expects to have two ovens for the production of shale oil in operation at Kvarntop in March. Another two are to be opened in June. The total production of shale oil will be 30,000 tons a year, and the sulfur output will not be much smaller since the oil shale contains as much as 5.7 per cent of sulfur.

New Wood Products Plants Built in Finland

The Aänekoski company has erected a sulfite alcohol factory which is expected to supply 1,700,000 liters of 95 per cent alcohol yearly. The new plant is situated near the company's existing sulfite cellulose plant. Oy Meriyal has formed a subsidiary, Tervanjalostus, which is to build a wood-tar products factory, and plastics of the phenol-formaldehyde type are to be made at Korsholm near Vasa by Bakeliittituote Oy.

Polish Staple Fiber Firm Increases Capital

Zellgarn A. G., Lodz, the Polish producer of synthetic fibers, has increased its capital from 500,000 to 8,500,000 marks. The company, which is affiliated with the Thuringian cellwool company, is to use processes developed in the works at Schwarza (Thuringia, Germany) for the production of synthetic fibers, but it will specialize in threads for use in agriculture and also produce casein wool. Its main product, however, will be cellwool for which a ready outlet is assured in the Polish textile industry, now suffering from extreme scarcity of raw material.

Polish Nitrogen Factory at Moscice in Full Operation

According to German press reports, the damage done to the nitrogen plant at Moscice has been repaired after short delay, and the plant is in full operation. Output is claimed to be higher than it was under Polish management. The works at Moscice produce various chemical fertilizers, ammonia, calcium nitrate, nitrophosphates, calcium carbide, ammonium nitrate, nitric acid, and calcium chloride. The special value from the German point of view is that the works are the most easterly of all big chemical plants in central Europe and favorably situated for supplies to the eastern front

Drug Manufacturer Established in Slovakia

The Slovakian Alkaloid Chemical Factory will produce over 3,000 pounds of pharmaceuticals in a new plant at Freistadt. The bulk of the production will consist of preparations from poppies. Later other drugs will be included in the manufacturing program. The factory will cover all of the local demand and have at least half its output available for exports.

Rumania Plans Output of Synthetic Rubber

I. G. Farbenindustrie and a Rumanian rubber manufacturing company are negotiating for the formation of a new enterprise to produce synthetic rubber from natural gas. It is intended to erect a plant with a capacity of 3,000 tons annually of the Buna material.

Rumanian Oil Production Declines under German Control

Provisional figures for the Rumanian petroleum industry, based on official data for January to October and estimates for November and December, indicate that crude oil production continued to decline in 1941 from 5,750,000 to 5,250,000 metric tons. Exports declined from 3,500,000 to 3,100,000 tons, although Germany absorbed virtually the whole refinery output of gasoline and also took 80 to 90 per cent of the kerosene and gas oil production. Drilling activity was maintained near the 1940 figure of 785,000 feet, largely owing to use of equipment transferred to Rumania from other German-occupied territories, but the Kontinentale Oel-G. m. b. H., joint undertaking of German oil producers, has so far failed to increase the output. Restrictions were placed in December on motor traffic, domestic oil heating, and use of residual fuel oil by the Rumanian railways. These measures may help increase the surplus for exports.

Rationalization Necessitated in Hungary by Territorial Gains

The Hungaria company of Budapest has increased its capital from 6,020,000 to 10,600,000 pengö for the merger with Phoenix, Metallochemica, and Zorka, three chemical companies which have had their works in Hungary since the annexation of Rumanian and Yugoslavian border zones by this country. Hungaria, controlled by Verein für chemische und metallurgische Produktion of Prague (now under German regulation), is also entering into close cooperation with the mining company of Nagybanva and has formed a joint sales company. Marketing problems are largely responsible for the merger with the other three companies, for the total production of sulfuric acid, paints, and fertilizers of the three exceeds the absorptive capacity of Hungary and it is intended to concentrate production in the cheapest works.

Expansion of Fertilizer Markets in Southeastern Europe Pushed

German producers of potassic and nitrogenous fertilizers have made systematic efforts to develop in neighboring countries and in the Balkan territories a market for supplies formerly sent overseas. Last autumn Slovakia doubled the consumption of chemical fertilizers from 1940, but still is far below the level of more progressive agricultural countries. To increase sales of German-produced fertilizers in Rumania, the association of agricultural syndicates in that country has received a loan of 100,000,000 lei. In Bulgaria fertilizer imports are in the hands of the Ministry of Agriculture which has embarked on a big propaganda campaign in favor of increased use.

Italy Attempts to Recover Copper from Vitriol Spray

According to Italian press reports, experiments have been carried out for the recovery of copper from vine leaves sprayed with copper sulfate. The leaves are burned and leave traces of copper among the ashes. It is said that 8 kg. of copper have been recovered from one hectare of vineyards, i. e., 5 pounds per acre.

Search for Domestic Raw Materials Intensified in Italy

Several companies engaged in the search for domestic raw and fuel materials have recently increased their capital. The S. A. Carburanti Combustibili Autarchici has been formed to investigate local fuel materials. The S. A. Aciende Ricerche Minerali Autarchici has raised its capital 50 per cent. The recently formed Societa Metanifera Italiana will search for natural gas. The National Railway Co. has taken out concessions to look for natural gas and vapors containing boracic acid in the provinces of Pisa, Grosseto, and Siena. The Vetrocoke company intends to utilize lignite deposits in the Mercure basin for the production of ammonia and ammonium sulfate.

Synthetic Rubber Output Reported from Italy

According to Axis sources, the first of two contemplated factories for the manufacture of synthetic rubber in Italy is now in operation, and construction on the other plant is proceeding. Earlier it was reported that one Italian firm was to use the I. G. Farbenindustrie process for Buna rubber, while another firm intended to make use of an Italian method for manufacture of another type of synthetic rubber.

As for raw materials, Italy has sources of natural gas which may be used. Besides, Azienda Nazionale Idrogenazione Combustibili, the large semistate hydrogenation company, recently announced that a pilot plant for production of liquid butane has been completed. This material, however, is to be used mainly for aircraft engines.

Spanish Dyestuffs Plant to Be Opened This Year

S. A. Fabricacion de Anilinasy Productor Quimicos, the Spanish firm which was authorized to build a dyestuffs factory at Barcelona, will begin production late in 1942 or early in 1943, according to the agreement with the government. Payment for imported raw materials is to be made by exports of finished products.

Tanning Extracts to Be Made in Spain

A plant for the manufacture of tannic acid and tanning extracts with a capacity of 1,000 tons of acid a year is under construction at Oviedo. The chief raw material is chestnut wood. The government has promised to help the industry by grant of tax privileges.

Spain Authorizes New Chemical Industries

Among recent authorizations for new industrial establishments by the Spanish Government are factories for bromides, oxygen and hydrogen, cellwool, ships' bottom paints, ammonium carbonate, perfumery, resin oils, plastics, lactose, soap, acetone and butyl alcohol, alcohol, tanning materials, and superphosphates.

G. ABRAHAMSON
150 HALFWAY ST.
SIDCUP, KENT, ENGLAND
February and March 1942

Demand for industrial chemicals in the British market is still very high, although further restrictions on civilian consumption and telescoping of industry tend to reduce requirements. The rationing of soap to four units a month, in which 3 ounces of toilet soap, 4 ounces of household soap, or 6 ounces of soap flakes constitute a unit, will curtail consumption of vegetable oils for this use one fifth, but demand for chemicals is unlikely to diminish by the same amount because of increased calls for water softeners, abrasives, etc. Price changes of industrial chemicals are few, and among fine chemicals there has been an improvement in one or two markets. Fertilizers are now absorbed by agriculture in the largest quantities on record in British history, but paint consumption is declining owing to completion of many government contracts. Business in coal-tar products is coming more and more under control, and creosote oil is disposed of in strict conformity with official instructions.

Chemical Control Board Is Supreme Authority in All Chemical Matters

The organization of control in the chemical industries has not changed radically during the past month, but as many more products come under control, coordination of work between individual

controllers becomes increasingly important. This essential part of organization is in the hands of the Chemical Control Board, under chairmanship of F. W. Bain. Although the staff of this office consists of only one senior officer, one personal assistant to the chairman, and one stenographer, it is the supreme authority in many matters affecting the chemical industries. Members of the Chemical Control Board are controllers for fertilizers, industrial ammonia, miscellaneous chemicals, molasses and industrial alcohol, plastics, and sulfuric acid. Other persons whose services may be required intermittently join meetings of the Chemical Control Board as occasion arises for the consideration of particular problems. All the chemical controllers have been associated before their appointment with the industries which they control. The system can be said to work satisfactorily.

New Factories Built and Products Manufactured

Azozol, 4-cyclohexyl-3-ethyl-1,2,4-triazole, a British equivalent of Azoman, is being made by Boots Pure Drug Co. At a new factory, Turner Bros. Asbestos Co., Ltd., is turning out asbestos cement roofing materials. The Yorkshire Dyeware and Chemical Co., Ltd., heretofore most interested in dyestuffs manufacture, will extend its activity to the founding of light metal alloy castings. Several new works have been and are being built for reclamation of used lubricating oils and rubber products. Production of reclaim rubber will be nearly doubled, if recent proposals are carried out.

Production of Nonferrous Minerals to Be Increased

A Controller of Non-Ferrous Mineral Development in the United Kingdom has been appointed to help develop mineral deposits in the British Isles. The most urgent task awaiting the new controller is expansion of tin mining in Cornwall where output during the past two years was around 1,500 tons yearly. A gain of 500 to 600 tons a year is expected as a result of increased working of the two operating mines, South Crofty and Geevor, for which more labor has been made available. Some of the Cornish tin mines which had to close down in recent years may be reopened, and waste piles at mineheads will be used. Nevertheless it is unlikely that the additional output during the next months will raise production much beyond 2,000 tons.

Two wolfram and one arsenic development have also been exploited with assistance of the Committee for Non-Ferrous Mineral Development, and it is expected that attention will be paid to lead mining in the north of England. Lead production from this source amounted to 54,700 tons in 1934. Output declined below 30,000 tons in 1937 and remained at that level because of low prices. There has been talk of a government subsidy for domestic mining operations, but nothing has been decided as yet.

Output of Nonmetallic Mines Is Stepped Up

Loss of continental supply sources and the desire to reduce imports of bulky merchandise to save shipping space are responsible for a great expansion of nonmetallic mining in the British Isles. This development is held up to some extent, however, by shortage of labor and available grinding machinery. Lime production has been increased beyond recognition under the food campaign, as agricultural lime is in great demand from farmers. England is also well placed for witherite, quartz, chalk which is found in many counties of southern England, slate from Wales and Cornwall, dolomite from the north of England, China clay from Cornwall, and kaolin from Dorsetshire.

China clay is now prepared as a substitute of talc and other fillers, but an impure grade of talc is produced in Banffshire so that the former imports from France and Italy can be partly replaced from this side. Ferric oxide and ochres, found extensively in the west of England, are getting attention for use instead of red oxide colors. For barites Britain used to rely on continental supplies for a light, pure product, but this is now partly replaced by domestic barites which have been bleached chemically. Large deposits of barites are available in Ayrshire, Devonshire, Shropshire, Derbyshire, and the north of England, but the output, though greatly increased, scarcely keeps step with the growing demand. Silica flour is used to extend the supply of barites. As for diatomite, a moderately good material is being worked in Northern Ireland and some low-grade earth in Westmorland. There are good but unworked deposits in Scotland, especially in Skye. A carbonaceous shale, called Bideford black, is also being mined.

New Control and License Regulations Are Imposed

Paraformaldehyde, metaformaldehyde, and hexamethylene tetramine must not be sold or bought without a license from the Molasses and Industrial Alcohol Control. Licenses are now needed for imports of shellac from Empire sources and for exports of asbestine, felspar, talc, barites, witherite, barium carbonate, barium sulfate, blanc fixe, inorganic fluorine compounds, vegetable adhesives, casein glue, animal and fish glue, gelatin and size, chlorinated rubber, and diphenyls.

Iron and Steel Institute Reports on Protective Coatings

Results of three years' research on the protection of iron and steel against corrosion have been announced by the Protective Coatings Sub-Committee, Iron and Steel Institute. In view of the comparatively low cost of the paint material as compared with the cost of labor for cleaning the surface and applying the paint (1 to 11 in some typical cases), the committee is critical of additions of extenders for the purpose of cheapening the paint, but additions for technical reasons, e. g., to prevent settling or to ease application, may be sound practice. Use of a red lead and graphite mixture instead of pure red lead is mentioned.

Specimens painted with one coat of red lead primer and one coat of red oxide of iron finishing paint have been found to be more efficiently protected than similar specimens painted with one coat of red iron oxide primer and one coat of white lead and zinc oxide finishing paint. Of paints with inhibitive properites, red lead is the most effective for general use. Chromate pigments—lead chromate, zinc chromate, and other sparingly soluble chromates—are not quite so good but give adequate protection in rural and marine atmospheres. They are inferior to red lead in industrial atmospheres. The relative efficiency of white lead, blue lead (basic lead sulfate), zinc dust, and zinc oxide has not been established with certainty. The best general finishing paints in quantity for use over red lead are red oxide of iron, white lead, and micaceous iron ore. As an alternative to linseed oil paints, especially during the war, tar paints are recommended. Their merit, especially in coastal and marine conditions, has been established. One coat of red lead followed after an interval of not less than one month by one coat of tar, neutralized with lime and treated with tallow, has been used with much success.

Firebricks Are Improved by Presence of Carbon Dioxide

The disintegrating action of carbon monoxide on certain firebricks at 450° C. is greatly decreased by the presence of 10 to 25 per cent of carbon dioxide, according to the Refractory Materials Joint Committee of the Gas Research Board and the British Refractories Research Association. If the carbon dioxide content is reduced to 5 per cent, disintegration is as great as, if not greater than, with pure carbon monoxide. A diatomite product, originally susceptible to disintegration by carbon monoxide at 450° C., was rendered inert by chlorination for 10 hours at

1,000° C. The resulting material was appreciably more refractory, it suffered less after contraction and deformation under load at 1,200° C. than the untreated brick, and was also found superior in this respect to a product which had received heat treatment without chlorine.

Plastics Find Use in New Recovery Plants at Gasworks

Plastics have played an important role as a construction material in new recovery plants built since the beginning of the war at gasworks and coke-oven installations. Synthetic resins, such as phenol-formaldehyde moldings or machined parts from laminated materials, castings from phenolic resins, urea resins, melamine, and synthetic rubbers, are recommended for structural application, in particular for towers for washing gases, low-temperature stills, frames for filter presses, and also small pieces of equipment. Phenolic resin impregnated asbestos in sheets or slabs which are lined into molds and heated, thus being converted into a hard and tough finished form, can be used as a protective lining for many purposes. Cast phenolic resin is utilized for pumps, density meters, ball valves, plugs for cocks, and many kinds of pipes. Synthetic resin cements are used for protection of brick-lined equipment for the recrystallization of salt solution.

Stable Coal Suspensions Are Tried Out at Leeds University

The Department of Coal Gas and Fuel Industries at Leeds University has studied the fluidity of coal tars and modification to give miscibility with petroleum oils. Blends have been prepared which remained stable for many months and were consumed in industrial furnaces without difficulty. They are capable of supporting pulverized coal in suspensions which appear to be permanently stable. Similar suspensions of coal have also been prepared in pitch-creosote mixtures. The investigation of the catalytic synthesis of methane has been pushed by development of a simple and not too expensive method for removing organic sulfur compounds, so as to attain the necessarily high degree of purity to avoid poisoning the catalyst. The work will be continued in a semiscale unit plant.

Temperature Measured by Range of Thermometric Colors

Temperature changes may be measured under difficult conditions by thermometric colors. I. C. I. (Dyestuffs), Ltd., is offering a full range permitting measurements between 80° and 320° C. Materials which change their color after 30 minutes at 80°, 140°, 150°, 160°, 170°, 190°, 240°, 270°, 300°, and 320° C. have been selected and the range is to be increased, but full accuracy cannot be guaranteed. On the other hand, it is possible to extend the range of observation if the available thermometric materials are exposed to temperatures for longer periods. The thermometric colors are sold in a liquid form and, besides the requisite pigment, contain a specially devised vehicle which ensures good adhesion.

Vitamin Tablets Issued to Industrial Workers

Issue of vitamin tablets containing a balanced compound of vitamins A, B, C, and D has been undertaken by a British firm, the North British Rubber Co., Ltd., as an experiment. As far as is known, it is the first of its kind in Great Britain, although vitamin tablets have been issued for some time to miners in Germany with, it is claimed, conspicuous success. The vitamin tablets are taken voluntarily by a large number of workers, but evidence is as yet insufficient to decide whether it has resulted in improved resistance to disease.

Antifreeze Compounds Not under War Restriction Needed in Canada

Canada offers a market for antifreeze compounds not falling within war restrictions, the U. S. Department of Commerce reports. Winter temperatures, there, except possibly on the Pacific Coast, make use of such compounds compulsory in all motor vehicles, and hitherto the need was met by Canadian manufacturers, with glycol-type compounds predominating in popularity and alcohol second. Since war demands have shut off the glycol type and quota restrictions on alcohol now stringently limit its use, a solution that can escape both restrictions is required.

Italy Plans Expansion of Nitrogenous Fertilizers

An extensive program of expansion for nitrogenous fertilizers is forecast from Italy, where the market is currently under supervision of the Italian Chemical Industries Corp., covering nitrogenous, phosphatic, and potassic fertilizers. It is believed 1941–42 domestic requirements of calcium nitrate also will be handled.

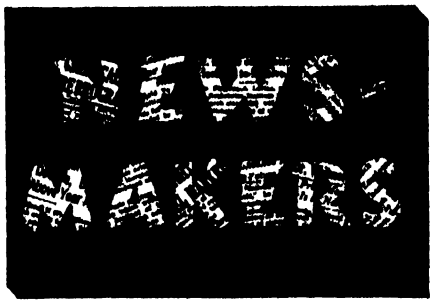
Production of Javanese citronella in October 1941 was 50 per cent below normal, although prices staged a recovery from an earlier decline.

Canada's High Chemical Exports Continue to Gain

Within the past calendar year Canada's already high exports in chemicals were further emphasized. Shipments to the United Kingdom predominated in Canada's chemical trade, with $23,761,000 of the $52,541,000 total for the first 11 months of 1941 going to that market. The United States absorbed $13,420,300 of this total, and at the same time continued its position as the principal supplier of chemicals and allied products for Canada. Total Canadian imports for the first 11 months of 1941 amounted to $60,006,100, of which $49,450,700 represented imports from the United States compared to $8,292,900 from the United Kingdom.

Indian Company Builds Plant to Relieve Textile Chemical Shortage

Large demands by the Indian textile industry and other mills for hydrochloric and sulfuric acids have led to a proposal by the Delhi Cloth and General Mills Co., Ltd., to erect a plant for production of these acids. The company is also said to be seeking to produce other chemicals required by their mills.



India's textile industry accounts for 90 per cent of that country's current consumption of chromium compounds, potassium dichromate, sodium dichromate, and chrome alum, the remainder being absorbed by the match industry, paint manufacturers, tanning, and medicines. Certain restrictions, operative since October 1941 on such compounds, bar use of chrome compounds in the textile industry except for goods manufactured to orders of the central government. No prohibition is placed on other industries, but handling of chrome compounds is under license.

Canada's Brewing Industry Uses $229,500 of Chemical Products

Chemical products costing $229,540 were used by Canada's brewing industry during 1940, according to official sources in that country. The list includes clarifying and filtering materials, $46,500; carbon dioxide, $70,870; lactic acid, $12,270; potassium and other salts, $21,100; anhydrous ammonia $11,600; and cleaning materials, $67,200.

Canadian Dyestuffs Committee Established

Canada has established a Dyestuffs Advisory Committee with the function of assisting in supply and distribution in the Canadian war program, according to the U. S. Department of Commerce. Among chemicals under the Controller of Chemicals there are phenol-formaldehyde resins and urea-formaldehyde resins, around which rigid restrictions have been ordered.

R. W. Aiken, formerly chief engineer with Frazier-Simplex, Inc., has been made plant engineer of the Jessop Steel Co., Washington, Penna.

L. Earle Arnow since March 1 has been director of biochemical research in the Medical Research Division of Sharp & Dohme, Inc., Glenolden, Penna. He was previously assistant professor of physiological chemistry, University of Minnesota Medical School, Minneapolis, Minn.

Allen E. Bailey, Jr., and **William D. Cockrell** have been appointed sales manager and engineer of General Electric's newly organized Electronic Control Section in the Industrial Control Division, Schenectady, N. Y. Mr. Bailey has been with G. E. since 1916; Mr. Cockrell since 1928. Both hold patents on electronic control.

Joseph S. Bates has been appointed vice president in charge of production for the General Aniline Division of the General Aniline & Film Corp., New York, N. Y. Since October Mr. Bates has been chief of the Coal Tar and Intermediate Section, Chemical Branch, War Production Board.

Tilford H. Bean has returned from Akron, Ohio, to Pittsburgh, Penna., where he will take up duties as an assistant project engineer in the Process Equipment Department, Blaw-Knox Division, Blaw-Knox Construction Co.

Murray Beebe has joined the staff of the Lea Manufacturing Co., 16 Cherry Ave., Waterbury, Conn. For many years he served in the department responsible for scientific research and development at the Scoville Manufacturing Co. of the same city.

Robert J. Bibbero is on leave of absence from the Pacific Manifolding Book Co., Inc., Emeryville, Calif., where he held the position of research engineer, and has accepted a commission as ensign in the Bureau of Ordnance, U. S. Naval Reserve. He is now stationed at the Naval Training School (Engineering), Bowdoin College, Brunswick, Maine.

Emil Ott, director of research of Hercules Powder Co., spoke on "The Chemistry of Cellulose and Cellulose Derivatives", March 20, at Western Reserve University, Cleveland, Ohio. He was the sixth speaker in a series of lectures by 12 men, each an authority in his particular field of chemistry. Dr. Ott's lecture was the concluding one in the first half of the series which was devoted to the chemistry of large molecules.

L. V. Steck has been appointed vice president of Shell Chemical Co., San Francisco, Calif., in charge of marketing. Mr. Steck is a graduate of the University of California. He engaged in chemical engineering before joining the staff of Shell Development Co. in 1930, where he specialized in market development. He was assistant director of the Shell Development laboratories until he began his new duties.

Carl D. Ulmer, who for 25 years has been associated with Koppers Co. at St. Paul, Minn., Chicago, Ill., and Pittsburgh, Penna., has returned to that organization as assistant director of research after a year's leave of absence during which he was chief of the science and technology division, the New York Public Library, New York, N. Y.

Harold Von Thaden

Harold Von Thaden, vice president of the Robins Conveying Belt Co., Passaic, N. J., recently returned from Rio de Janeiro, Brazil, where he served as a special adviser to the United States delegation to the conference.

Howard W. White has joined the research and development staff of the Bakelite Corp., Bloomfield, N. J.

J. B. Wiesel, director of sales of the Cellulose Products Department, Hercules Powder Co., has been appointed adviser to **J. B Davis,** chief of the Protective and Technical Coating Section of the WPB. Mr. Wiesel will have charge of the allocation of nitrocellulose and ethyl cellulose. He will devote half his time to the board work in Washington, and half to his work with Hercules. The company is contributing his services to the WPB.

GREYSTONE STUDIOS INC

J. B. Wiesel

Robert D. Williams has been named a research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and will assist in welding research. He was formerly a member of the faculty of the University of Illinois.

Louis E. Wise, who until lately has been a member of the staff of Rollins College, has accepted a permanent appointment at the Institute of Paper Chemistry, Appleton, Wis.

William Frederick Zimmerli has been appointed vice president in charge of research and patents of General Aniline & Film Corp. For a number of years Dr. Zimmerli was the European technical representative of E. I. du Pont de Nemours & Co., Inc., in London, and since 1939 he has been head of the development department of that company in Wilmington. His connection with the chemical industry dates back 30 years.

Smith Goes to Institute of Gas Technology

JULIAN F. SMITH is relinquishing his work as associate director of the Hooker Scientific Library, Central College, Fayette, Mo., to serve as technical librarian and editor of publications of the Institute of Gas Technology. The institute, which is affiliated with Illinois Institute of Technology, began its program of education and research in September 1941. It plans to develop a library of gas technology which will rank first in scope and in service to the gas industry.

Dr. Smith will divide his time between the Institute of Gas Technology and the Hooker Scientific Library for several months and after giving up his active work with the latter will continue to act in an advisory capacity.

POTOMAC POSTSCRIPTS

Actions of WPB

Chlorinated Solvents. General Preference Order M-41, which limits the use of chlorinated hydrocarbon solvents, has been extended to May 15, 1942. It was scheduled to expire March 31. The solvents included are carbon tetrachloride, trichloroethylene, perchloroethylene, and ethylene dichloride. They are used in charging fire extinguishers, grain fumigation, manufacture of refrigerants, processing and manufacture of food, chemicals, and petroleum.

Chlorine. The effective date of General Preference Order M-19 as amended February 25, drastically restricting use of chlorine, has been postponed from April 1 to May 1. Further study of the order has revealed a complexity of forms required in connection with certain uses out of all proportion to the amount of chlorine used in the industries involved. Changes in the order, which will permit necessary control and reduce the number of forms and reports involved, are being studied.

Chromium. Limitations on the use of chromium in chemicals are imposed in Order M-18-b. The use of chromium in the manufacture of roofing materials, ceramics, soap, and glass is prohibited. Chromium pigment is restricted to 90 per cent, by months, of the amount used in the year ended June 30, 1941. Chromic acid manufacture is restricted to 80 per cent of the base period, and chromium for leather tanning to 90 per cent. All other uses of chromium as a chemical are restricted to 100 per cent of the base period. Chromium for the preservation of wood is restricted to preference ratings of A-10 or higher. Nothing in the order restricts the metallurgical or refractory uses of chromium.

Dyestuffs. Because dyestuffs are necessary for the manufacture of military uniforms, Conservation Order M-103 curtailing civilian use of organic coloring matter has been issued. The order provides that 10 dyes, with colors ranging from orange and yellow to brown, khaki, and olive drab, be set aside entirely for war use. Civilian use of all other anthraquinone vat dyes and other derivative dyes is limited for the second quarter of 1942 to 12.5 per cent of the amount used during 1941.

No producer may export more than 8 per cent of his total dyes requiring anthraquinone or derivatives in their manufacture. He may export 3 per cent of his total production of those basic dyes set aside for war use. WPB officials expect this will make available to the Allied countries dyes for the uniforms of their armed forces.

Formaldehyde. A preference rating of B-3 to help embalmers obtain formaldehyde is granted in Amendment 6 to Order M-25. The previous rating was B-4. Amounts to be obtained by embalmers are limited, by calendar quarters, to one fourth the amount used for 1940.

Laboratory Equipment. Preference Rating Order P-62, covering material needed for production of laboratory equipment and reagent chemicals, has been extended to June 30. The order, which would have expired March 31, will probably require producers now using it to change over to the Production Requirements Plan by June 30. An amendment abolishes the report form, PD-93, which was required by the original regulations.

Oils. Use of cocoanut oil, babassu oil, palm kernel oil, and other oils with a high lauric acid content is restricted in General Preference Order M-60. Because these oils provide a high yield of glycerol, needed for war purposes, the order prohibits any use of such oils which does not produce glycerol or in which the amount of glycerol remaining in the product exceeds 1.5 per cent on an anhydrous soap basis. In April and May customary use will be permitted in each month to 50 per cent of the average monthly use in 1941. After June 1 the order goes into full effect.

Effective immediately no high lauric acid oil may be used in the manufacture of margarine, shortening, or cooking fat. No processor may saponify more than 75 per cent of his average monthly use of these oils, or fatty acids derived from these oils, for saponification in 1941.

Any person or firm that had an inventory on March 19 of more than 30,000 pounds by weight of high lauric acid oil or oil equivalent must set aside and hold, subject to the direction of the Director of Industry Operations, 25 per cent of it. Reports of such inventories must be submitted to the WPB on or before April 15 on Form PD-354. Copies of this form are available from the Washington or field offices of WPB.

Operating Supplies. Drums, containers, and other packages, and materials to be physically incorporated in them are included in "operating supplies" under terms of the preference rating order for the chemical industry, P-89, according to an official interpretation. Also included in "operating supplies", for which a preference rating of A-3 may be assigned by producers as defined in the order, are materials to be used for sealing or fastening packages.

Rapeseed Oil. To conserve the supply and direct the distribution of rapeseed oil, the Director of Industry Operations has issued General Preference Order M-77.

Rapeseed oil can be used only for the manufacture of marine engine oils, heavy machine lubricating oils, pneumatic tool oils, blown rapeseed oil, and elastic solids for compounding rubber, unless specific authorization for other uses is given.

The order contains a requirement for the setting up of 30 per cent of all inventories in excess of 50,000 pounds as a reserve. The oil will not be available in the future for either edible uses or for soap manufacture.

Rubber and Latex. To save more than 1,000 tons of crude rubber and latex a month, WPB has amended Supplementary Order M-15-b, reducing the permitted consumption of crude rubber or latex in more than 50 products and eliminating it entirely in about 20 products. Amendment 7 also transfers more than 15 products from lists which allow use of rubber up to certain percentages of a base period to lists of products for which manufacturers must have specific permission from the Rubber Branch of WPB to use rubber or latex.

The new list A of the order—that listing products for which crude may be used only up to certain percentages of the average monthly consumption for the year ended March 31, 1941—now contains 23 groups compared with the previous list of 31. List B—products for which manufacturers must have specific permission—has been increased from 10 to 27.

Steel Drums. Manufacturers of steel drums and 5-gallon kits have been requested to furnish the Containers Branch of WPB with additional information on products shipped in such containers and the end use of the products. This information, necessary for the determination of the proper preference ratings to be issued to manufacturers, is to be provided on forms which should accompany PD-1A applications for steel for the drums. The forms can be obtained from the Priority Specialist, Containers Branch, War Production Board, Social Security Building, Washington, D. C.

Price Regulations

Benzene, toluene, xylene, and solvent naphtha obtained from by-product coke ovens will continue to be sold through the second quarter of 1942 at prices prevailing during the first quarter, according

to a request from OPA to producers and sales agents. Prices in the first quarter were established following a similar request last December 15 to avert threatened price increases.

Fertilizers. In its second move to hold down costs to farmers in their all-out production of crops, OPA has imposed maximum margins which mixers and dealers may charge to farmers for sodium nitrate, ammonium sulfate, and cyanamide. These are three nitrogen materials used as fertilizers without the admixture of other chemicals. The new permanent schedule, Maximum Price Regulation 108 follows Temporary Maximum Price Regulation 1 which established, as of February 27, ceiling prices for 60 days on the retail sale of mixed fertilizers. The regulation does not affect the base price paid by the mixer.

Maximum margins for cash sales of the three fertilizers, direct or through agents to consumers, are established at $4.00 per ton; maximum margins of mixers for cash sales to dealers, $2.00 per ton; and dealers' margin on cash sales to consumers, $2.00 per ton. All transportation expenses and the cost of tax tags and attaching the tags, paid by the reseller, may be added to such margins, records of which must be kept by resellers. In the case of ammonium sulfate, the mixer's margin may be increased by $1.50 per ton when it is purchased in bulk by the mixer and resold in bags. The cost of the bags, if not included in the purchase price for the ammonium sulfate paid by the mixer, may also be added to his margin.

Maximum Price Regulation 108 does not cover sales in Washington, Oregon, California, Montana, Wyoming, Idaho, Nevada, Utah, Colorado, and Arizona. Further investigations are being carried on as to practices in these territories.

Rubber Drug Sundries. Manufacturers of rubber drug sundries, including essential hospital and medical items, have been requested not to advance prices above those in effect March 1. It was asked also that all discounts, services, quality standards, and reasonable trade practices in effect March 1 be maintained.

Purpose of the request is to keep prices from mounting pending completion of an investigation to determine proper maximum prices for rubber drug sundries.

Industrial Alcohol Program Advances

THE program of substituting grain for molasses as the base for some industrial alcohol is going forward successfully, William L. Batt, director of materials, has announced. If arrangements made thus far can be carried out during the year, a saving of the equivalent of 550,000 tons of sugar will result, he said. A recently passed bill will remove existing barriers to redistillation of 140-proof alcohol from beverage distilleries into 190-proof in the Nation's large industrial distilleries and will provide added impetus to the conversion program.

The change-over from molasses to grain has been difficult and will be carried on all during the year. In normal times the Nation's alcohol-making facilities are divided into two kinds—beverage distilleries which make whisky and other potables from corn and other grains, and industrial distilleries which make 190-proof alcohol from blackstrap molasses, a by-product of sugar manufacture. With the outbreak of war, the demand for 190-proof alcohol, used in the manufacture of smokeless powder and other munitions, increased more than 300 per cent. There was not enough blackstrap to fill the demand and high-test molasses, which would ordinarily go into sugar, had to be used in addition.

The Chemicals Branch, WPB, foresaw a possible shortage of sugar for alcohol and started last summer on a program for conversion of whisky distilleries into making 190-proof alcohol. At that time there were only a few plants in the country that could be utilized. Legal restrictions and lack of equipment barred the way.

The first step was to seek removal of legal barriers and on October 16, 1941, a bill was introduced in Congress to permit simultaneous production of industrial alcohol and beverage alcohol and also to allow these plants to operate seven days a week. This became law on January 24, 1942. WPB ordered all distilleries capable of producing 190-proof alcohol from grain to do so to the limit. While this has resulted in a great increase in grain alcohol output and has for the time being alleviated the situation, it is not a permanent solution.

The basic problem is a complex one of rejuggling existing facilities and working out transportation and storage problems, as it obviously is impossible under existing circumstances to build new plants requiring large amounts of copper, steel, and electrical equipment. Beverage distilleries generally fall into two classes and split about 50-50 as to output. The first class has facilities to produce 190-proof and these are now engaged in doing it. The others are smaller plants, larger in number but smaller in output, that are capable of producing only 120- to 140-proof and have no redistilling facilities. It is in this field that the problem of shifting equipment and facilities is complex. With passage of the new law, it will be possible to gather this low-proof alcohol and ship it to industrial distilleries for conversion into 190-proof. By 1943 this program is expected to produce double or more the amounts of industrial alcohol it will turn out this year.

Meantime engineering changes are going on at strategically located plants to increase grain alcohol facilities. Some beverage distilleries require only a small amount of equipment to produce 190-proof alcohol. These are being supplied from old and idle plants and from others which have a surplus of certain types of apparatus.

WPB Amends Maintenance Ratings for Chemical Plants

SUPPLIES necessary for the repair and maintenance of chemical processing plants are now obtained under new ratings set forth in the amended Preference Rating Order P-89 of the War Production Board. Up to the present time no company has received permission to operate under the original order because applications indicated that the order as originally issued was too broad.

The basic purpose of the order is to facilitate the acquisition, by chemical manufacturers, of sufficient operating supplies, maintenance and repair material to enable plants to continue at present rates of efficiency. It is not intended, however, to cover the acquisition of raw materials including solvents which enter into production or the product manufactured, with the single exception of catalysts. Neither does the order cover additions nor expansion of plants. Replacements are possible under the present act, however, when capital equipment is beyond repair. The privilege of high preference orders, ranging from A-1-A to A-3, does not extend to all chemical manufacturers but only to manufacturers of materials essential to the war program. In order to use the preference ratings, a manufacturer must submit to the War Production Board, in triplicate, application form PD-315, describing the type of materials manufactured. The WPB, if the application is accepted, will then issue a serial number which must be used when applying preference ratings to maintenance materials requested from a supplier.

The following preference ratings have been assigned. A-1-A to deliveries to the producer of material for repair when, and only when, there has been an actual breakdown or suspension of operations in the plant. A-1-C to deliveries to the producer of the material for repair up to the minimum required to make reasonable advance provision to avert an immediately threatened breakdown or suspension of operations in the plant. A-3 to deliveries to the producer of other materials for repair, maintenance, or operating supplies. A-3 to deliveries to a supplier of any material for repair, maintenance, or operating supplies which are to be delivered by him or by another supplier to the producer under a rating assigned or which will be used to replace in a supplier's inventory material so delivered.

Full specifications, regulations, and forms may be obtained from the War Production Board, Washington, D. C. David L. Watson is administrator of P-89.

Asbestos Industry Reaches High Point

Sales of domestic asbestos, which reached 24,391 short tons in 1941, were the highest in the history of the industry, exceeding those of 1940 by 22 per cent, according to the U. S. Bureau of Mines. Their value was 8 per cent greater than in 1940. Most of United States production is of the shorter grades of chrysotile, but long-fiber chrysotile obtained in Arizona is increasingly important. During recent years domestic production has supplied only 4 to 8 per cent of national requirements, the balance being imported. Under wartime restrictions, data on imports are available for only the first nine months of 1941, but imports for this period were unusually heavy. It is possible, therefore, that the ratio of imports to production has been approximately the same as in recent years.

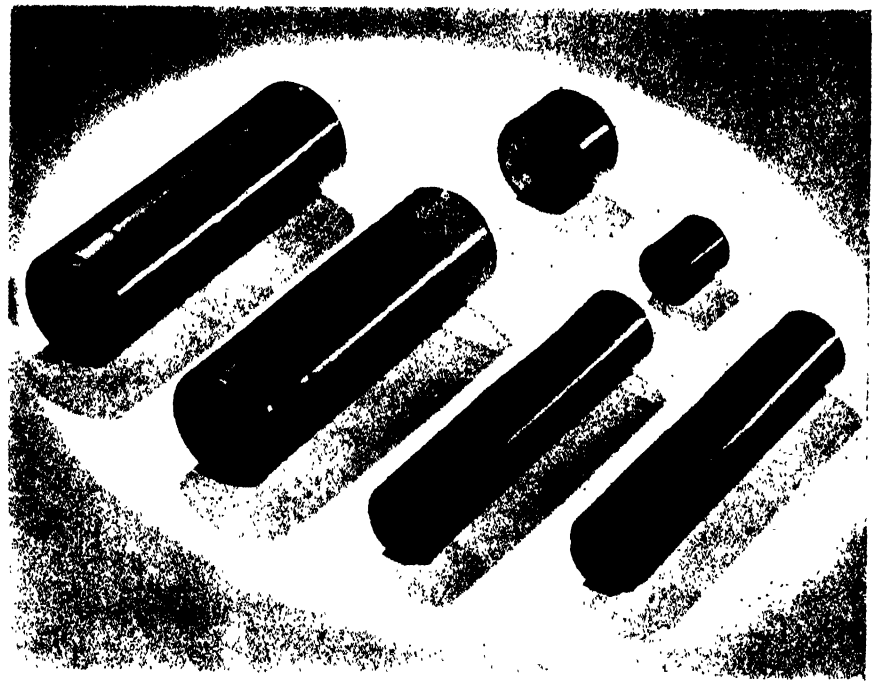
Canada, as for many years, supplied most of United States imports. Canadian chrysotile, of superior quality, is a satisfactory raw material for most asbestos products. African chrysotile, imported in considerable quantity during recent years, is interchangeable with Canadian asbestos for many uses, and continuation of such imports is desirable to supplement the supply of Canadian long fiber.

Since chrysotile obtained in Rhodesia and in other African localities is very low in iron, it is preferred for manufacture of electrical tapes and other equipment designed for high electrical resistance. Canadian chrysotile contains considerable magnetic iron oxide (magnetite, Fe_3O_4) and is less suitable for the more exacting uses. Certain varieties of asbestos such as amosite and crocidolite (blue), obtainable in quantity only in Africa, are adapted to specialized uses for which Canadian fibers are less suited. Amosite can be made into insulation mattresses of exceptionally low weight per cubic foot and is well adapted for use on naval vessels. Blue asbestos is so resistant to chemical action that it is preferred for acid filters and as a constitutent of acid-resistant asbestos-cement pressure pipe. As these uses are related intimately to the military program, problems of African supplies and possible utilization of asbestos from alternate sources are under constant study.

Hershey Emphasizes Necessity for Occupational Deferments

Local boards of the Selective Service System have been asked to consider fully requests for occupational deferment of men necessary in war production, agriculture, or other essential civilian activities, in a letter to all state directors from Lewis B. Hershey, director of the system. In a large number of cases the right to appeal on occupational grounds has been overlooked, Mr. Hershey says.

To expedite final determination of occupational deferment cases and to eliminate the possibility of erroneous classification through failure to take advantage of procedural rights, a new method has been adopted. When a local board denies a request for Class II-A or Class II-B deferment in a case where there is on file an affidavit to support claim for occupational deferment, DSS Form 42A, the local board is directed no longer to send to any person who has signed Form 42A a notice of classification, DSS Form 57, but to send a notice to employer of the right to appeal, DSS Form 59.



Local boards have been directed to give particular attention to cases where neither Form 42 nor 42A has been filed but in which the Selective Service Questionnaire, DSS Form 40, indicates that occupational deferment should be considered. Mr. Hershey's letter points out that efforts should be made by the local board to contact those persons likely to provide additional information or affidavits which will assist the board in determining the proper classification.

Instead of deferring from active military service reserve officers in essential occupations, the War Department is now permitting such officers to resign their commissions upon the basis of necessary occupational activity, subject to approval and acceptance by the department. In most cases these men will be immediately required to present themselves for Selective Service registation. Mr. Hershey has instructed that such claims for occupational deferment be given the same serious consideration as would claims of any other registrant engaged in a similar activity and occupation.

Felt Becomes a War Material

The use of wool felt in odd and important ways in the armament effort focuses attention on this ancient material and the ease with which various types may be manufactured to meet engineering specifications. The pictures and captions on pages 476 and 477 review the various manufacturing steps and some of the many uses.

Shortages in materials are considerably broadening the use of felt as an insulator because, as rubber, plastics, cork, and leather become scarce, felt is substituting satisfactorily in many cases. Felt lines soldiers' helmets, goes under the mounts of gun turrets in fighting planes, insulates airplane fuselages and wings, reduces vibration in army tanks, and serves in parachute landing pads, jungle pack saddles, and blackout curtains. In the automobile industry 6,000,000 pounds and 65 different types of felt are used. The success of intravenous feeding depends upon the use of a felt washer for filtering air. One of the biggest fields is in insulation for absorbing the vibration of heavy machinery.

Plastic Ammunition Rollers

On the world's fastest and most heavily armed dive bombers, ammunition is fed to machine guns over Tenite plastic rollers. Tenite, a Tennessee Eastman Corp. product, stands up under this strain of constant wear and hard blows where ordinary materials would split or shatter. Ammunition rollers are molded by Columbus Plastic Products, Inc., for Curtiss-Wright Corp., Port Columbus, Ohio. Control stick handles, instrument dials, dehydrator tubes, electric light lenses, bomber visors, and tank covers are typical of the many Tenite parts used in the aviation industry.

Reclaimed Rubber Status Discussed

THE United States faces a 1,000,000,000-pound shortage of rubber for the year 1943 and, in the opinion of P. M. Elliott, Naugatuck Chemical Co., "the reclaiming of rubber is not the answer to our problem". Occasion for Dr. Elliott's statement was the annual spring meeting of the New York Section of the Division of Rubber Chemistry of the AMERICAN CHEMICAL SOCIETY, held March 20 at the Building Trades Club in New York, and attended by more than 300.

Estimated needs of the United Nations for the year 1943 are 2,000,000,000 pounds of crude, Dr. Elliott said, and after the requirements of 1942 are met, we will have a surplus of 278,000 tons of crude with which to meet our expanded rubber needs of 1943. The Nation should import, for that year, about 135,000 tons of crude, 165,000 tons should be produced synthetically, and 1,000 tons may be had from guayule shrub. This leaves a deficit of roughly 1,000,000,000 pounds or 500,000 tons.

Rated capacity of all rubber-reclaiming plants in the United States is 360,000 tons, Dr. Elliott later revealed, but the problem is not alone in capacity. Other considerations are supply of material to the reclaimer, amount of original crude in reclaim supplies, and the type of rubber and the physical properties of the material wanted by the rubber processor.

After a brief illustrated description of the digester process, which is used by 80 per cent of all rubber reclaimers in the country, Dr. Elliott discussed the physical limitations of reclaim and the problems faced by the user of the material. The bulk of reclaimed rubber is much like regular crude in that it is vulcanizable. Users of reclaim, however, must realize that the material has somewhat different properties, and allowance must be made for these differences if the ultimate value is to be obtained. Users should select, first, the type of reclaim best suited for their purpose; selection must also be made on the basis of rubber hydrocarbon present, accelerators added must be adjusted, amount of filler added must be adjusted according to the amount already present in the rubber, and the processing qualities must be given p...

Only when these points are considered will the maximum results be obtained. The supplier is in best position to advise and supply analyses for the purchased material. Manufacturers carry stocks from which a selection for best physical properties can be made.

Many new things are being made from this rubber which a short time ago were considered impossible, said Dr. Elliott. Tennis shoes are an outstanding example, as they were formerly made of new rubber. Results now indicate that successful shoes are made with the reclaimed material.

It was also revealed that equal proportions of new crude and reclaim may be used in compounding of usual rubber objects without decrease of quality, and that, without addition of used rubber made originally from new crude, the reclaiming cycle may be carried out four or five times with good results.

The real answer of how this rubber and the industry will fit into the wartime industrial scheme rests with Washington, however, said Dr. Elliott in conclusion, as the War Production Board will determine the type of rubber to be manufactured and how much of our rubber will be used admixed with the raw crude now in our stock piles.

Dr. Mark, professor of organic chemistry at Brooklyn Polytechnic Institute, followed Dr. Elliott on the program and gave a résumé of polymerization theory.

Fertilizer Antitrust Suit Settled

THE fertilizer antitrust suit, which, with the preliminary investigation, was under way for more than three years, was terminated on March 24 in the Federal Court at Winston-Salem, N. C. Originally there were 102 defendants—two trade associations, 64 fertilizer companies, and 36 officials of the defendant corporations.

The defendants, except seven as to whom the case was nol-prossed, entered pleas of nolo contendere. Defense attorneys pointed out that defendants did not enter the pleas out of any sense of guilt but largely because of war emergency conditions and demand upon their time and energies. Judge Johnson J. Hayes commended the attorneys on both sides for reaching a solution that did not involve a long and expensive trial, and ordered that a hearing be held for taking testimony to give him information as to business operations in the industry and the issues involved in the suit. These hearings extended from March 16 to March 24, when the judgment of the Court was rendered.

The defendants who were nol-prossed are: Arkansas Fertilizer Co., F. W. Tunnell & Co., Inc., Harold F. Ayer, John F. Maybank, A. Quistgaard Petersen, E. H. Westlake, and George A. Whiting. The Court imposed no penalty upon Charles [illegible] executive secretary of the National Fertilizer Association, saying that there was no evidence to indicate any intention whatever on his part to violate the law in letter or spirit. Fines imposed on corporations range from $500 to $9,000 and on individuals from $2 to $4,000, aggregating about $255,000.

Among industry practices under attack were the exchanging of price schedules and port basing-point prices. It was pointed out to the Court that government publications show that these practices are not new in the industry but have been in existence for many years.

The settlement of the suit did not include entry of any consent decrees as to future business practices in the industry.

Occupational Questionnaire

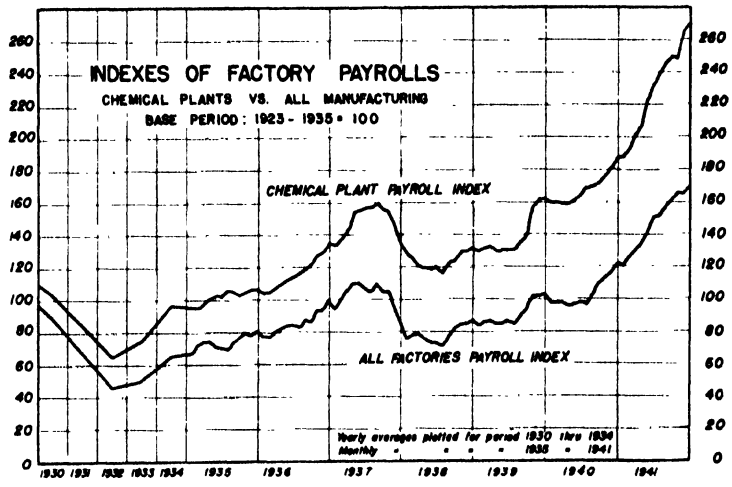
BEFORE the end of April, many businessmen will be called upon to help the Government list the occupational skills of all men registered under the Selective Service System. This survey is to be made by the United States Employment Service in cooperation with Selective Service Boards. Questionnaires will be sent by the boards to all men between the ages of 20 and 44 who registered on February 16. This will be in two parts: one for the local Selective Service Board, and one for the United States Employment Service. Later the same questionnaire will be sent to other registrants between the ages of 18 and 64.

One purpose of this questionnaire is to obtain from each man a statement as to his occupation and skills. Accompanying the questionnaire will be a list of 225 jobs essential to war production. Every man is asked to check those in which he has had experience or training. The questionnaires must be filled out and returned to the local Selective Service Board.

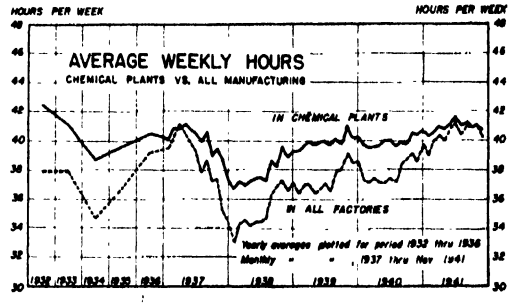
That part of the form intended for the employment service will be sent to its nearest local office for examination to determine which men are already qualified or can be quickly trained for war production work. These men will then be asked to go to the office for an interview as to possible jobs.

Men with skills important to war production will be classified as follows:

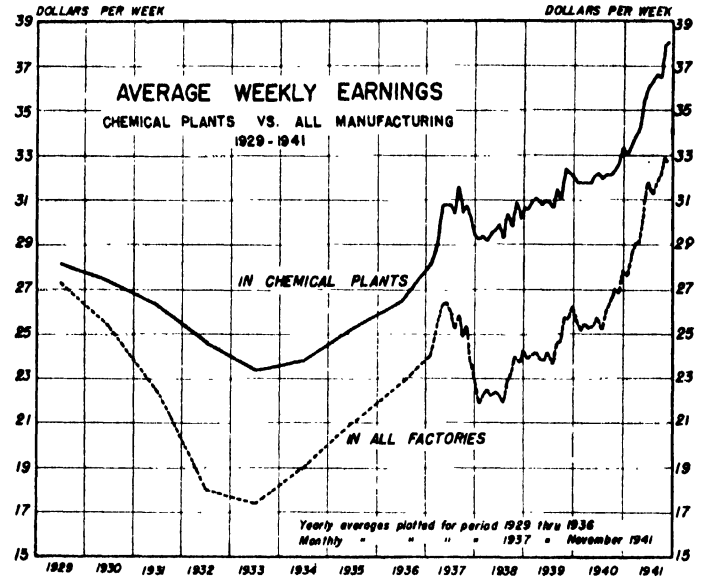
1. Those who are now working in war industry and cannot be easily replaced.
2. Those who are now working in war industry but can be replaced within a reasonable time by vocational trainees or others not suited for military service.
3. Those who are not using those skills in war industry but can be shifted to a war industry job.

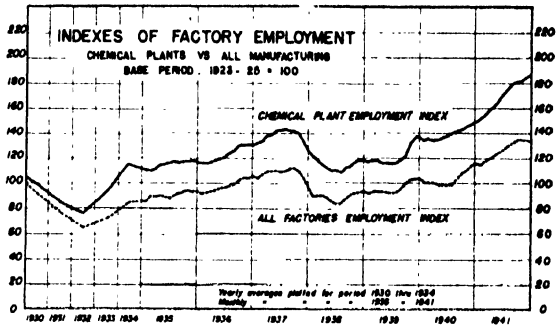


If the man who fills out the questionnaire needs help in answering any of the occupational questions, he should go to his employer. Some of the questions may be puzzling to many men, and to some the importance of listing their secondary skills and those they have used on other jobs may be overlooked. The employer is urged by the United States [illegible] Service to explain to each worker who seeks his aid the significance of the questionnaire and to help him fill it out properly.

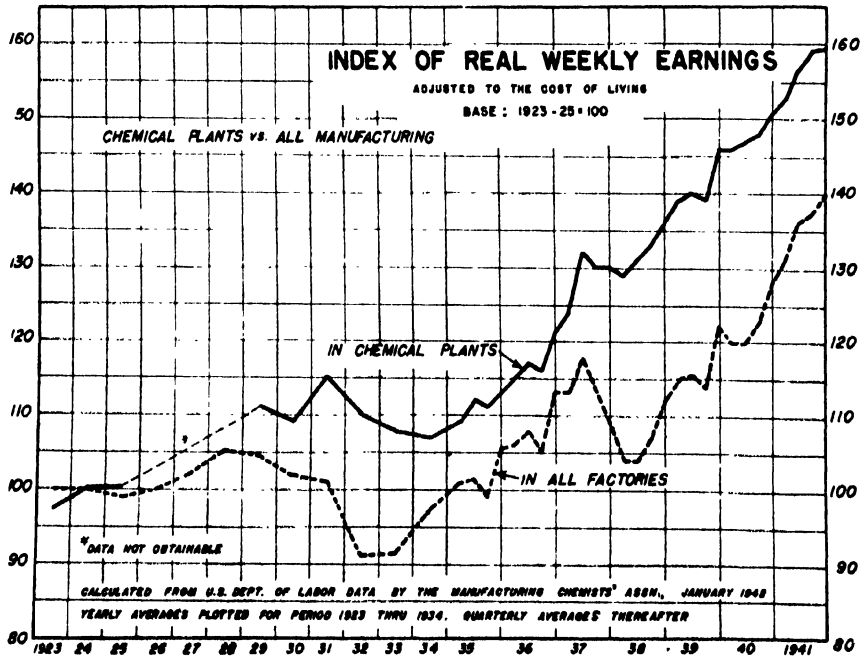


The complete listing of the skills of the Nation's manpower will be of particular advantage to employers because it will help industry to retain men with special occupational ability, as well as to obtain skilled men for war production jobs.

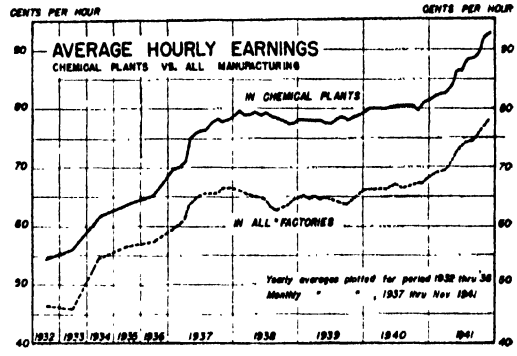




Wage, Hour, Employment, and Price Trends



The Chemical Industry Compared with All Industry



STATISTICS in these graphs were compiled from official sources by the Manufacturing Chemists' Association, 608 Woodward Bldg., Washington, D. C. The chemical graphs in this M. C. A. Statistical Report No. 18 show only the data listed by the United States Department of Labor under chemicals and do not include soap, explosives, petroleum refining, rayon, drugs, fertilizers, cottonseed oil, cake, and meal, and paints and varnishes.

WE'VE *Streamlined*

OUR NAME
FOR YOUR CONVENIENCE

IN FIL CO.

INFILCO

INCORPORATED

The decision to streamline our 48-year old name, will not surprise our many friends in the chemical process industries. They know we've outgrown it. In fact, the word "filter" is no longer even remotely descriptive of 70 per cent of the equipment we manufacture.

For many years the trademark (INFILCO) has identified Silica Gels, catalysts and zeolites as well as equipment for chemical precipitation, process water conditioning, chemical feeding and proportioning, clarification, etc., engineered and manufactured by this organization for the chemical process industries.

(INFILCO)

PRODUCTS for the
Chemical Process Industries

Accelator Softeners & Clarifiers
Anion & Cation Exchangers

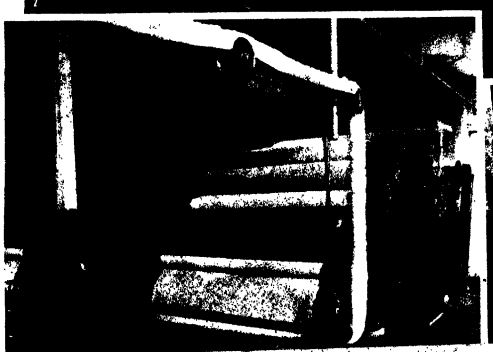
(1) Firm felts are finished by sanding and brushing. (2) After the hardening operation wool felt goes to the fulling mill where, in a moist stage, it is kneaded by large power hammers and overhauled until the material acquires the required density.

Felt can be made so hard by this process that it can be turned on a lathe. (3) Instead of being spun into thread, wool for felt is carded in batts from which the felt is fabricated directly by hardening and fulling. (4) Felt is practical for blackout curtains. (5) Sheet felt, after it leaves the fulling mill, is stretched on tenter frames in drying ovens. Many tons of pressure must be applied by heavy chains and screw jacks. (6) The wool felt undergoes its first exclusive treatment in the hardening press. The batt of loosely intertwined fibers is unrolled on a blanket where it is wetted down and steamed. It is then carried under the platen, the heavy cast iron gridlike element shown at left, which is lowered to the batt, and heavy pressure applied. Violent agitation of the platen causes fibers to interlock and the batt emerges as a sheet. (7) Sheep's wool is cleaned and degreased in tubs and the fleece is picked apart by the clawlike rotating fingers. (8) Selected materials in specified proportions of each grade are run through the pickers, blown into the air, and further mixed and baffled until the fibers are uniformly interlaced.

Photographs by courtesy of the Committee on Information of The Felt Association, Inc. Use of felt in the war program is outlined on page 472.



(9) From the carding operation blended wool fibers emerge as a tenuous web deposited on an endless moving blanket. Webs from other carding machines are criss-crossed over the first and pressed by a brass roller. (10) Dyed felts are dried by radiant heat in ovens banked with powerful electric lamps. (11) Stainless steel dye kettles used in dyeing felt. Modern dyehouse equipment is used throughout for the finer wool felts.

(12) Fine grade felt is finished in a shearing machine which removes all roughness and protruding hairs. The shearer is mounted on felt pads and secured to the cement floor by special adhesives. No lag screws or bolts are used.

American Chemical Society[1]

103RD MEETING. Memphis, Tenn., April 20 to 23, 1942.

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., spring of 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION. Stevens Hotel, Chicago, Ill., November 17 to 22, 1942.

NINETEENTH NATIONAL COLLOID SYMPOSIUM, Division of Colloid Chemistry. University of Colorado, Boulder, Colo., June 18 to 20, 1942.

Other Scientific Societies

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, Southwestern Division. Las Cruces, N. Mex., April 27 to 30. Annual meeting.

AMERICAN ASSOCIATION OF CEREAL CHEMISTS. Edgewater Beach Hotel, Chicago, Ill., May 18 to 22. Annual meeting.

AMERICAN ASSOCIATION OF INDUSTRIAL PHYSICIANS AND SURGEONS and AMERICAN INDUSTRIAL HYGIENE ASSOCIATION. Hotel Gibson, Cincinnati, Ohio, April 13 to 17. Annual meeting.

AMERICAN CERAMIC SOCIETY. Hotel Netherland-Plaza, Cincinnati, Ohio, week of April 19. Annual meeting.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Boston, Mass., May 11 to 13.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Chicago, Ill., June 22 to 26.

AMERICAN LEATHER CHEMISTS ASSOCIATION. Deshler-Walleck Hotel, Columbus, Ohio, June 1 and 2.

AMERICAN OIL CHEMISTS' SOCIETY. Rice Hotel, Houston, Tex., April 30 and May 1.

AMERICAN SOCIETY OF BREWING CHEMISTS. Hotel Netherland-Plaza, Cincinnati, Ohio, May 25 to 27.

AMERICAN SOCIETY OF REFRIGERATING ENGINEERS. Skytop Club, Skytop, Penna., June 7 to 9.

AMERICAN SOCIETY FOR TESTING MATERIALS. Atlantic City, N. J., June 22 to 26.

ELECTROCHEMICAL SOCIETY. The Hermitage Hotel, Nashville, Tenn., April 15 to 18.

INSTITUTE OF FOOD TECHNOLOGISTS. Hotel Nicollet, Minneapolis, Minn., June 15 to 17. Annual meeting.

NATIONAL PETROLEUM ASSOCIATION. Hotel Cleveland, Cleveland, Ohio, April 16 and 17 Semiannual meeting.

SCIENTIFIC APPARATUS MAKERS OF AMERICA. Hotel Hershey, Hershey, Penna., June 1 to 3.

[1] The list of the SOCIETY's National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 187 of the February 10 issue.

Symposium on Medicinal Chemistry

AS PART of their annual joint meeting, the Virginia Academy of Science and the Virginia Sections of the AMERICAN CHEMICAL SOCIETY will sponsor a Symposium on Medicinal Chemistry. Speakers from Virginia educational and industrial institutions and from other states will present papers in this general field. The symposium will be held at the Hotel Roanoke, Roanoke, Va., Saturday, May 9, 1942, at 9 A. M. Persons interested in the various aspects of medicinal chemistry are cordially invited.

The program includes the following papers:

ALFRED BURGER. Introduction.

C. R. ADDINALL. Recent Developments in Medicinal Chemistry.

JACKSON P. ENGLISH. Sulfanilamide Chemistry.

J. STANTON PIERCE AND H. B. HAAG. Chemistry and Pharmacology of Newer Local Anesthetics.

FREDERICK BERNHEIM AND ALFRED BURGER. A Basis for the Chemotherapy of Tuberculosis.

Discussions of the prepared addresses will be opened by Luther R. Modlin, Jr., Division of Chemotherapy, U. S. Public Health Service, Washington, D. C.

Further information may be procured upon application to Alfred Burger, Department of Chemistry, University of Virginia, Charlottesville, Va.

19th Colloid Symposium

Boulder, Colo., June 18 to 20, 1942

THOSE planning to attend the Boulder, Colo., Colloid Symposium, held under the auspices of the Committee of Colloid Science of the National Research Council and the Colloid Symposium Committee of the Division of Colloid Chemistry of the AMERICAN CHEMICAL SOCIETY, are advised to make early reservations since Colorado is a popular vacation center. The University of Colorado summer session, usually enrolling over 4,000, promises to be large this summer and in addition numerous conventions are scheduled for Boulder during the summer months.

Rooms at the Boulderado, Albany, and Monticello Hotels range from $1.25 single to $4.50 double. Blanchard's Lodge is situated 3.5 miles up Boulder Canyon and has both rooms and cottages available at prices ranging from $1.25 single to $3.00 double. Estes Park and Estes Park Village are located 31 miles to the northwest of Boulder on a beautiful, paved, easy ascent mountain highway, and Denver is 32 miles southeast on a paved, plains highway. Good hotels are available at both places. The Boulder, Estes Park, or Denver Chamber of Commerce will send descriptive literature and lists of hotels and cottage camps to anyone requesting them.

Inquiries regarding housing facilities should be sent directly to the hotels; for other information address Frank E. E. Germann, University of Colorado, Boulder, Colo.

Akron Rubber Group Meets

THE spring meeting of the Akron Rubber Group was held March 20 at the Akron City Club with 200 in attendance. Mr. Weitz, General Electric Co., delivered a very interesting lecture on applications of radiations from filament and gaseous sources. He demonstrated the newer types of lighting equipment and discussed their value in everyday life. A pertinent example was color and the kinds and degree of light available for effective blackouts.

The following officers were elected to guide this group through 1942–43: *Chairman*, T. L. Stevens; *Vice Chairman*, A. E. Sidnell; *Secretary-Treasurer*, W. J. Krantz.

Chemical Club of Philadelphia

THE Chemical Club of Philadelphia at its annual meeting, March 30, elected the following officers: president, F. S. ("Jerry") Dubbs, American Cyanamid & Chemical Corp.; vice president, Charles A. Wagner, C. A. Wagner Co.; treasurer, W. R. E. Andrews, W. R. E. Andrews Sales Co.; secretary, G. B. Heckel, Jr., *The Paint Industry Magazine*.

The club has been rather inactive during the past year, but has determined to reorganize on a sound basis. A proposed new Constitution and By-Laws, modeled somewhat upon that of the New York Chemical Sales Group, was submitted for approval by John F. Kirk, General Chemical Co., and will come up for final action at the next meeting, scheduled for April 13.

Civilian Defense Talk Covers Combustion

AS THE first lecture in a series on "Citizens' Defense and Protection", sponsored by the Civilian Defense Corps in the Cincinnati Metropolitan Region on the University of Cincinnati campus, "Incendiary Bombs" was presented by Saul B. Arenson, professor of inorganic chemistry. The talk was the first on incendiaries and covered the phenomena of combustion as follows:

1. History. Discovery of oxygen by Chinese, Leonardo da Vinci, Scheele, Priestley, and Lavoisier.
   Demonstrations: Retort with mercury, bottle of mercuric oxide, crucible lid floating on a cork in water, covered by bottle of air. Samples of red and yellow phosphorus.
2. Oxidation. Definition, tie-up with rusting and utilization of food. Heat as important product in incendiary bombs.
   Demonstrations: (*a*) Candle burning under closed funnel, products of candle combustion pulled through lime water. Proof that carbon dioxide is fire extinguisher by slanting trough and candles. Breath blown through lime water.
   (*b*) Burning of sulfur.
   (*c*) Burning of magnesium ribbon, powdered magnesium, powdered iron (thrown in flame).
3. Factors controlling rate of burning (tied up with fire control).
   Demonstrations: (*a*) Degree of fineness. Powdered carbon *vs.* stick of charcoal. Powdered iron *vs.* picture wire. Powdered magnesium *vs.* big rod of magnesium (which is kept from burning). Sample of fireproofed material like celotex. Explanation of fireproofing.
   (*b*) Temperature. Oxygas blow torch to burn strip of zinc, picture wire, thick copper wire. Heating lump of calcium oxide.
   (*c*) Concentration of oxygen. Burn samples of charcoal, picture wire, and sulfur in flask of pure oxygen.
4. Gas explosions.
   Demonstrations: Diffusion of hydrogen from inverted cylinder into air below it, forming mixture which can be ignited by taper. Soap bubbles filled with hydrogen-oxygen mixture ignited.
5. Combustion in other media.
   Demonstrations: (*a*) Water. Sodium and potassium in cold water, phenolphthalein to test solution formed. Magnesium ribbon burning in steam.
   (*b*) Chlorine. Dutch metal and antimony placed in cylinders of chlorine.
   (*c*) No added material. Thermite in clay crucible. Pieces of iron to be welded. Since movies were available to show thermite bombs in operation, this sample of thermite was not ignited.
6. Fire extinguishers. Principles involved, types.
   Demonstrations: Volatility of carbon tetrachloride, sodium carbonate–hydrochloric acid mixtures with and without gelatin.

These typical freshman demonstrations and explanations are somewhat similar to those performed by Wm. Lloyd Evans, Ohio State University, for the State Civilian Defense Commission of the State of Ohio.

The evening following Dr. Arenson's demonstration, the discussion covered "Control of Incendiary Bombs" and was given by George Rieveschl, Jr., instructor of chemistry, and William Licht, Jr., instructor in chemical engineering, Chemical Engineering Department, University of Cincinnati.

A. I. CH. E. Student Chapter at Tufts

THE 79th A. I. Ch. E. Student Chapter at Tufts College was inaugurated by Sidney D. Kirkpatrick, president of the American Institute of Chemical Engineers, March 17, at the Engineers' Club in Boston with about 70 of the new members present. A banquet at which Dean Harry P. Burden was toastmaster preceded the inaugural. Other speakers were John T. Blake, director of research of the Simplex Wire and Cable Co.; Gustavus J. Esselen, vice chairman of the Massachusetts Board of Professional Engineers; Leonard Carmichael, president of Tufts College and head of the National Roster of Scientific Personnel; and Kenneth Bell, chairman of the Boston Section of the institute.

The officers of the new chapter are: president, William Page; vice president, Thomas Pritchard; secretary, Arthur Waddell; treasurer, Edwin West; councilor, M. E. Othmer.

At a recent election, the following men were chosen to hold office next year: president, James Kelley; vice president, Henry Der; treasurer, David Swig.

Foster D. Snell, Inc., Holds Annual Dinner

FOSTER D. SNELL, INC., held its annual staff dinner on March 20 at The Brooklyn Club with 36 members present. The guest speaker, Harold St. L. O'Dougherty, a well-known Brooklyn attorney who for many years was United States District Attorney for the Eastern District, kept his audience amused with his narration of incidents in his career. Tracking down counterfeiters involved many unusual experiences which made excellent after-dinner speech material. Following the speech movies were shown. The entertainment concluded with a general community sing.

On the Reading of Scientific Papers[1]

Audience Enemies Numbers 1 to 6

EUGENE F. DuBOIS

Department of Physiology, Cornell University Medical College, New York, N. Y.

A FEW years ago a large international congress was held in one of the most beautiful cities of Europe. The committee on arrangements had planned every detail to perfection. The university buildings were new, the lecture halls ample. Each platform was provided with a two-foot clock that not only pointed out the elapsed time but also turned on a red light at eight minutes and a big flashing light at 10 minutes. When the meeting started, one could say "Every prospect pleases".

Only man was vile. One hour after the opening, members realized that the distinguished chairmen of the sections were not holding the speakers to the 10-minute limit so carefully stipulated in the programs. Therefore, every speaker counted on talking 15 or 20 minutes. Of course he saved his most important slides until the end, and they were shown in competition with the flashing light plus an obviously nervous chairman.

In addition, there were all the other minor and major human defects best calculated to torture an audience. Most of the speakers mumbled their words or else turned and lectured to the lantern screen. This was particularly annoying, since the papers were delivered in four different languages, each with its local variants. Most of the lantern slides were photographs of typewritten sheets crowded with data, and few speakers were content to show less than 20. The main points were carefully concealed until the last minutes, by which time the audience had lost all interest.

This meeting was perhaps an extreme example, and in our country most of the papers are carefully prepared and carefully delivered. There are, however, enough poorly delivered papers to warrant a discussion of what may be called "audience enemies":

1. The Mumbler, who drops his voice to emphasize important points or else talks to the lantern screen instead of to the audience.
2. The Slide Crowder, who packs his slides with typewritten data and shows too many slides.
3. The Time Ignorer, who talks beyond the limit specified in the program or justified by common courtesy.
4. The Sloppy Arranger, who jumbles his material.
5. The Lean Producer, who has poor material.
6. The Grasping Discussor, who when he gets talking stays talking.

Of course there are many other ways in which a speaker may cause discomfort, but the ones that I have selected are chosen because they can be remedied either by the head of the department or by strict self-examination.

Number 1, the Mumbler, is handicapped by poor habits of speech, an incorrectly placed voice, or else an inherent nervousness. In other cases bad delivery is caused by lack of consideration in a man who is more interested in excreting words than in conveying information. When he turns to the screen and talks at the chart he is paying more attention to his own achievements than to the audience. This is particularly disastrous if he wanders away from the microphone.

Number 2, the Slide Crowder, wishes to show just as much of his data as possible and thus demonstrate his industry. He prepares many slides from typewritten sheets, because this is the easiest method. He ignores the fact that the typewriter has the worst possible type for display at a distance. Has any one ever seen such type used on advertising billboards? If he would only have his slides drawn with India ink the very labor involved would cause him to limit his material to the essentials, and these would be legible. It is a simple matter to calculate for a 10-minute paper just how many seconds each slide will be exposed on the screen and how much can be read and understood while thus exposed. Every nonessential word or figure distracts the eye from the small fraction that is essential. A good slide needs no pointer or verbal explanation.

The ideal method of competing with a slide is to employ one of the modern flashlights with a bright arrow that dances all over the screen and ceiling. There is nothing in black and white that has a chance of holding the eye when a bright arrow swoops and darts like a hornet.

Number 3, the Time Ignorer, who exceeds the limit set by the program is purely selfish or else overimpressed with the idea that his paper is much more important than the program committee had imagined. He may have planned deliberately to go overtime but more probably did not take the trouble to rehearse his paper with a watch. If he did use a watch he forgot that it always takes several minutes longer to deliver a paper from a platform than to read it in an empty room.

Number 4, the Sloppy Arranger, selects the method of presentation best calculated to confuse the audience. He may have in the back of his head the idea that he can lead up to a climax and hold the audience in breathless suspense until in the very last sentence he can prove that the venous blood of the wimpus contains only 3 mg. of gadgetyl chloride instead of 4 mg. Would it not be kinder to the audience if he followed newspaper technique and gave in a headline, early in the talk, some idea as to what and wherefore?

Number 5, the Lean Producer, is only relatively lean. If he has one fact to exhibit and does it modestly he has made a contribution. If he does not recognize his paucity of material he does more harm than good. The real audience enemy is the man whose paper consists of trivia, errata, omissia, et cetera; mostly et cetera.

Number 6, the Grasping Discussor, can spoil almost any meeting. If he has been invited to open the discussion he has probably prepared a nice little paper of his own with scant reference to the paper of the evening. There is another type of discussor who happens to have in his pocket some lantern slides that he would just like to show for two minutes.

In the face of all these enemies the audience itself can do but little. The chairman, however, can do a great deal. Perhaps instead of chairman he should have the title of "Sole Protector of the Audience". If he has established a reputation for keeping people within their time limits they will take the trouble to arrange their material and lantern slides and bring out their main points in a decent manner. The faults of poor delivery, poor slides, and poor material are the responsibility of the head of the department. He should guard the reputation of his institution. Unfortunately, some heads of departments exhibit in their own deliveries many of the faults enumerated.

The time to start training is when a man is young. In one medical school this has been tried successfully with the fourth-year students taking their clerkship in the medical dispensary. Every Saturday morning a group of clinical clerks have gathered to hear four 15-minute papers delivered by members of their class. The students have been warned that the papers are limited strictly to 15 minutes and that in rehearsal they must not take more than 12 minutes. They are advised to talk to the men in the back of the room, since these are the most difficult to keep interested. They are taught that time spent in listening to a dull lecture, poorly delivered, is not wasted if they study the faults of the speaker and consider the methods by which they may be avoided. In a few sessions they develop a technique of delivery that is much better than the average found at scientific meetings. This allows the speakers and the audience to forget the delivery and concentrate on the subject matter.

The man who goes overtime, uses crowded slides, and mumbles his words is seldom more than 50 per cent audience enemy. If his paper comes in the middle of the session it does not affect the first half of the program, even though he talks

[1] Reprinted from *Science*, New Series Vol. 95, No. 2463, page 273, March 13, 1942

far beyond his limit. If his slides are crowded, half of the material can be read by the front half of the room. The same front half can usually hear him, even though he mumbles his words. He would not dream of saying, "The public be damned". He just damns the rear half.

New War Program at N. Y. U.

CONSULTATION with government and industrial officials has led the faculty of the College of Engineering at New York University to adopt a new accelerated war training program that is believed to be the first of its kind in the Nation. The plan will free trained junior engineering students for four months' service with war industries by mid-May.

Third-year students, who have completed all basic engineering studies, will be released about May 15 to work with war industries for four months during the all-out production drive this spring and summer; and the academic program of all undergraduates will be accelerated by the elimination of most regularly scheduled holidays during the academic year. Some 250 present seniors will complete their studies in April.

The plan follows urgent appeals by the President and Donald M. Nelson for a production speed-up during the spring and summer of this year. "One man in war production this spring and summer is worth five next year".

Under the continuous summer study program adopted by many engineering schools, no additional engineering personnel will be available much before next February. Approximately 1,100 engineering students will be affected by the war program at New York University College of Engineering, with 250 juniors and some sophomores available to war industries this summer.

An important aspect of the newly adopted program will be the availability of the college classrooms and laboratories during the summer for defense research and for the continuance and expansion of the various government training programs being conducted for the Army Air Corps, Ordnance Department, Signal Corps, Weather Bureau, Navy, U. S. Office of Education, and other government agencies. In one instance alone, this will make possible an increase of 150 per cent in the training of personnel for an important military bureau.

The New York University accelerated engineering plan includes an academic speed-up from September to April, makes the third-year students available for work in war industries this summer, and yet graduates the class of 1943 only two months later than does the modified speed-up, or continuous summer study program, adopted by many institutions. The four months' summer work experience will familiarize students with industrial procedures and practices, making them more valuable after graduation in April.

The students, after completion of summer work in war industries, will resume classes about September 15, 1942, and the returning fourth year men will be graduated in April 1943. The present sophomores, according to the plan, will be available for the next four-month employment period by May 15, 1943.

This plan does not affect students in the Evening Division and Graduate Division, where approximately 1,500 students, most of whom are employed, are being trained.

J. J. Mattiello Scholarship Committee

A NEW scholarship committee, the J. J. Mattiello Scholarship Committee, has been set up to establish fellowships for graduate study. The funds of the committee are obtained from the proceeds of Dr. Mattiello's work on "Protective and Decorative Coatings", recently published by John Wiley & Sons. The Scholarship Committee consists of Dr. Mattiello, technical director of the Hilo Varnish Co. and a member of the Chemists' Club, L. W. Ryan of the United Color & Pigment Co., J. J. Bradley, Jr., of Bird & Son, Inc., with R. J. Moore of the Bakelite Corp. as chairman.

The first two-year fellowship has been established at Polytechnic Institute, Brooklyn, under the guidance of Raymond E. Kirk, head of the Department of Chemistry, and H. Mark. The first designated fellow is Sidney Siggio, a graduate of Queens College. His subject, "Water-Dispersible Binders for Protection and Decorative Coatings", will deal with the fundamentals of emulsions and their stabilities.

J. T. Baker Fellowship Award

THE J. T. Baker Chemical Co. Fellowship in Analytical Chemistry (Midwestern Division) for 1942–43 has been awarded to Arnold J. Veraguth, who will work under G. Frederick Smith at the University of Illinois.

Check the Experiment

CITING his home city of Los Angeles as an example, Carl Omeron, a dentist whose hobby is scientific research, claims that most American cities can scrape up plenty of rubber in the present automobile tire shortage. Pointing out that approximately 1,000,000 motor vehicles are registered in the Los Angeles metropolitan area, Dr. Omeron asserts that each vehicle deposits at least 1 pound of rubber from each tire on city streets and highways during a one-year period. This rubber, worn off and skidded from tires, is found principally at boulevard stops and on curves. Since each vehicle has at least four tires, this totals to about 4,000,000 pounds of rubber a year.

Dr. Omeron estimates that 25 per cent of this scraped-off rubber can be reclaimed effectively to give about 1,000,000 pounds of rubber a year. He says it is an easy job to separate the rubber from oil, tar, and other residue scraped up with it, and that the resultant rubber, added to chloroprene, would increase the tensile strength and longevity of retreading material and make an effective contribution to the defense effort. Dr. Omeron suggests the scraping operation be done by large wire brushes attached to motorized sweepers, now used in all large cities. The sweepings would be scooped into a special hopper or drum.

WIDE WORLD PHOTOS

Dr. Omeron scraping and measuring rubber from a street intersection

NECROLOGY

Weyman S. Crocker

WEYMAN S. CROCKER, chief chemist for Crocker, Burbank & Co., paper manufacturer, Fitchburg, Mass., died on March 14 at the age of 47.

M. R. Dinkelspiel

M. R. DINKELSPIEL, associate editor of The Merck Manual of Therapeutics and Materia Medica died March 13 at the age of 68.

Dr. Dinkelspiel became associated with Merck & Co., Inc., in 1929 and in addition to his work on the sixth and seventh editions of The Merck Manual he made many contributions to the company's professional literature. He was a member of the New York County Medical Society, New York State Medical Society, American Medical Association, American Society of Tropical Medicine, and the American Association for the Advancement of Science. He was a medical officer in the first World War.

Francis D. Dodge

FRANCIS D. DODGE, chief research chemist of the Dodge & Olcott Co., died March 15 at the age of 74.

Dr. Dodge was born in Washington, and was graduated from the Brooklyn Polytechnic Institute in 1884 and the Columbia University School of Mines in 1888. After attending Heidelberg University for two years, he obtained his Ph.D. degree at Columbia University in 1891. He was an instructor at Columbia for a year before joining the Dodge & Olcott Co. in 1891. He was a member of The Chemists' Club (New York), and had belonged to the AMERICAN CHEMICAL SOCIETY since 1901.

Francis I. du Pont

FRANCIS I. DU PONT, former vice president and director of E. I. du Pont de Nemours & Co., Inc., died March 16 at the age of 68.

Mr. du Pont was born in Wilmington, Del., December 3, 1873. He entered the University of Pennsylvania, then transferred to the Sheffield Scientific School, Yale University, from which he was graduated in 1895. He began work for the du Pont company as a chemist at the smokeless powder works at Carney's Point. In 1903 he established the company's research and experimental station, and was soon elected to a vice presidency and membership on the board of directors. He built his own experimental laboratory in 1917 and operated it as the Delaware Chemical Engineering Co. Here he developed processes leading to the organization of the Ball Grain Explosives Co., which manufactured fuses in the World War, and also perfected the minerals-separation process. He held more than a hundred patents, and was known chiefly for his work in the field of smokeless powder and his development of the "sink and float" process for the separation of minerals.

In 1931 he entered the financial field in New York, founding the investment company of Francis I. du Pont & Co., of which he was senior partner. He had been a member of the AMERICAN CHEMICAL SOCIETY since 1915.

Lloyd B. Edgerton

LLOYD B. EDGERTON, vice president of the Philadelphia Quartz Co., Philadelphia, Penna., died March 15 after a long illness. He was 55 years of age. Born in Barnesville, Ohio, Mr. Edgerton graduated from Ohio State University, class of 1909. He then became associated with the General Electric Co. at Schenectady, N. Y., in the Steam Turbine Testing and Service Department. In 1913 he entered the employ of the Philadelphia Quartz Co., assuming charge of the Engineering Department. He was appointed works manager in 1930, director in 1934, and vice president in 1935. He was a member of the American Society of Mechanical Engineers and the Engineers' Club of Philadelphia.

Mr. Edgerton is survived by his wife, two sons, and a daughter.

John J. Johnston

JOHN J. JOHNSTON, formerly department head in the Chemical Products Division, Bayway Refinery, Standard Oil Co. of New Jersey, died March 17 at the age of 76.

Mexico Supplies Bulk of U. S. Arsenic Imports

MEXICO continues as the chief foreign source of arsenic used by the United States, recent figures disclose. Production by that country in the first eight months of 1941 amounted to 8,507,818 kg. with a value of 3,166,925 pesos. Exports in the same period were 8,302,000 kg. Of the 13,000,000 pounds of white arsenic the United States imported during this time, 11,300,000 pounds came from Mexico. Canada and Japan shipped the remainder.

ORGANIZATION of the Compania Anonima Electroquimica de Caracas, Venezuela, to produce chlorine was completed in September, according to advices received in the United States. Operations are to start as soon as the necessary equipment is received.

Assault Boats for the Marines

Assault boats constructed in a Goodyear actory are shown preparatory to being delivered to the United States Marines at undisclosed locations. While designed for tough, rugged, abusive service, these boats are the ultimate in compactness when deflated, are extremely light in weight in relation to the loads they will carry.

This Chemical Age—The Miracle of Man-Made Materials. *Williams Haynes.* 1st ed. 381 pages + xxix. Alfred A. Knopf, New York, N. Y., 1942. Price $3.50.

It is an unusual chemical book whose author boasts: "I am rather proud how little chemistry there is in this book which deals with all the new synthetic chemical products". The reader is disarmed, and perhaps charmed, by being told that in the first two chapters he will learn all the chemistry he needs in order to "enjoy" the rest of the book. The first chapter is almost entirely an account of the life of Cavendish and of the proof of the composition of water. How easily the author evades being didactic is shown by the opening sentences of the chapter:

> Almost everybody knows that water is H_2O. You may test this for yourself quite easily by a sort of personally conducted Gallup poll. But do not ask only such likely people as taxi drivers, butchers, and manicurists. Ask distinguished members of the bar and of the League of Women Voters. Ask also college professors of English or Latin who disdain the sciences as a chemist shuns Greek verse. It is surprising how many people can tell you that H_2O means water in the chemical language.

In this breezy style the author writes simplified chemistry, not because that is the only kind he knows, but because his appeal is to those whose sole knowledge of the subject is contained in the quotation, or is even less. He studied chemistry at Johns Hopkins University, is the author of other chemical books, and was the editor of *Chemical Industries*. The last experience gave him an excellent chance to become acquainted with the development of chemical technology during recent years. The reader gets the benefit of this acquaintance in a series of chapters on significant developments, beginning with Chapter III, Black Tar to Bright Dye, which is chiefly an account of Perkin and his accomplishments. Instead of saying that dyes, medicinals, and perfumes are "extracted" from coal tar, he says that the production of any of these "is a building-up process, far different from the popular notion that by some sort of magic all these different substances are picked out of the mysterious black tar". If he deserves commendation for this he falls from grace by saying that some of the new plastics are made from "coal, air, and water", which is just as misleading as extracting dyes from tar. Then to make the matter worse: "that the pretty blue cups and saucers in the picnic hamper are made literally out of four gases is a practical joke almost beyond the realm even of miracles". What he means is a urea-formaldehyde plastic. The urea comes from ammonia and carbon dioxide. The formaldehyde is made by oxidizing methanol prepared by the hydrogenation of carbon dioxide. This last is not a misprint, for it is "the gas of soda water".

There are very readable chapters on the German dye cartel, on explosives, perfumes and flavoring substances, on medicinals—the sulfanilamide family has a whole chapter—celluloid and other plastics, rayons, rubber and its rivals, and petroleum.

On the whole the book is well written and accurate in chemical matters, but because a reviewer is supposed to be captious a few mistakes must be pointed out. Some may be misprints, for instance "positons" in text and index. This cannot be said of the relation between water, methyl alcohol, and dimethyl oxide by the replacement of first one and then the second hydrogen atom by a methyl, C_2H_5, group. "Pontinac", used six times on five consecutive pages, cannot be a misprint. Crude turpentine as it exudes from the tree is not the "sap", and Hevea latex is not "rubbery sap". It is hardly fair to say that the producers of carbon black willfully make it "by igniting natural gas in faulty burners".

The reviewer cannot check the statistics given here and there in the book, but was surprised by some of the arithmetic. It is said that the 26,000,000,000 gallons of gasoline produced in a year would fill Great Salt Lake twice over. The author incautiously adds that the lake is 80 miles long, 20 to 30 miles wide, and has an average depth of 13 feet. Taking the width as only 20 miles, the reviewer found that the lake holds more than 4½ trillion gallons. Any reader who is so inclined can calculate from the basic figures given on page 26 how many times an electron revolves around a proton in 0.000,000,001 second.

The occurrence of a number of mistakes that can be corrected in the second edition does not detract seriously from the value of the book. The author has given us a breezy, interesting, and essentially correct account of the more important achievements of chemists, without which our daily life would be far different from what it is. The lay reader and many chemists can profit by reading it.

C. E. Waters

Glass. The Miracle Maker. *C. J. Phillips.* 424 pages. Pitman Publishing Corp., 2 West 45th St., New York, N. Y., 1941. Price, $4.50.

This book is primarily for the user of glass and should be very valuable, particularly to those who are not glass technologists and who want to know something of the chemical and physical properties of this material which has come to the industrial forefront lately. One of the sad things about the former use of glass has been the almost total ignorance of scientists, technologists, and engineers of the properties of glass. Because of this a great deal of technical work of no value has been reported. Often the engineer has omitted to use glass because of a lack of understanding of the physical and engineering properties of the material.

Mr. Phillips does a first-class job of giving the story of glass from both the technologist's and engineer's viewpoint. It contains enough of glass manufacture to indicate both its limitations and possibilities; it includes the chemical and physical properties; it goes into the various methods of making glass and the type of machines used; and it includes the proper testing.

The last half gives a brief story of various places in which glass has been used—in architecture, art, electrical transmission, illumination, manufacturing processes, and research.

The book is written primarily from the outlook of the Corning Glass Works, a proper recognition of its unique position in the field. It is indexed, has numerous good representative pictures, is very well printed and bound, and is easy reading.

It is unusual to find a book full of so much technical information that is so readable, even occasionally being mildly humorous.

F. C. Flint

Modern Plywood. *Thomas D. Perry.* 1st ed. 366 pages. Pitman Publishing Corp., 2 West 45th St., New York, N. Y., 1942. Price, $4.50.

Thomas Perry, who has long been a notable contributor of articles on plywood to technical publications, now carries his work forward with a timely book. Plywood, says the author, has been revolutionized with the development of resin adhesives. Certainly it is a subject

which has historical, technical, and popular interest.

The technical details begin with the advantages of plywood—that plywood is economical, that its strength is distributed in two directions, that it is available, and that it is easy to fabricate. After that there follows the process of cutting veneers, the adhesives used in plywood, the manufacture of high-density plywood, the ins and outs of the trade. And what gives a special interest to the book is the chapter on Plywood in Industry. Here is learned its use in aircraft, barrels, boats, furniture, sporting goods, building construction, and many other fields.

The book is written in the style of a textbook; students may be its largest users. A glossary of terms used in the plywood trade introduces the subject and a bibliography of considerable size completes the last chapter. The book is well supplied with charts, tables, and illustrations, and as a further indication of the versatility of the subject, the book is bound with plywood covers.

In the resin adhesive field, where research and development are making such rapid strides, it is exceedingly difficult for an author to make a book up to date. However, this book furnishes a foundation for plywood information which certainly renders a service to our advancing technical knowledge. For the reader in search of a background on plywood, this volume offers a great deal.

HENRY GRINSFELDER

Chemical Engineering for Production Supervision. *David E. Pierce.* 1st ed. 232 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $2.50.

IN THE words of the author, this book was written "for the man who wants to analyze difficulties in operation, check efficiencies, and utilize the equipment to the best advantage". It will surely fill a long-felt need for production men in chemical industries because it presents basic principles in a simple, straightforward manner, for the practical men who lack a technical education, for supervisors and foremen, and for engineers who have lost their intimate contact with technology and the complicated problems of modern chemical industrial equipment.

The first chapters present the groundwork of chemistry, physics, and thermodynamics. The properties of matter, the theoretical aspects of change of state, and the behavior of matter in solution are all outlined simply and directly, with the obvious purpose of providing the necessary background for the mathematical handling of the common phenomena of chemistry and physics. The basic gas laws and the extremely important laws of thermodynamics and thermostatics are also outlined and illustrated, with the emphasis merited by their value to the engineer. Many well-chosen problems are presented, some with solutions, for the definite purpose of making clear to the nontechnical man the utility and scope of the information being presented. Ability to make use of data and methods of calculation should be the primary aim of every reader and student who uses this book.

A chapter on the transformation of energy explains with simple mathematical means the various commonly encountered changes of the state of energy from potential sources to dynamic utilizations. The combustion of fuels, condensation of vapors, transformation of mechanical and electrical energy, work, and heat are all given a simple and reasonable treatment. This is carried on into the mathematical treatment of heat and enthalpy, and a thorough discussion of methods of heat transfer. Conduction, convection, radiation, and combinations of the three methods are discussed and their mathematical approach explained. The simpler methods of using heat-transfer coefficients, over-all coefficients, the means of obtaining coefficients, and proper ways of handling uncomplicated problems are clearly outlined. An excellent discussion of mean and average temperature differences and their use is the high light of the heat-transfer explanation.

In the last chapters these basic principles of engineering are applied to the specific computation of the problems of equipment in the four unit operations of chemical engineering—Evaporation, Distillation, Drying, and Flow of Fluids. An extreme simplicity of technical approach, combined with a thoroughly practical viewpoint, characterizes these chapters. The main emphasis is placed on equipment, its operation and repair, utilization, and limitations. Theory is subordinated, although the important basic applications of mathematics are outlined briefly. This way of treating the subject matter seems new because it is so seldom encountered, but it enhances the value of the discussions for the practical man and for the engineer whose scope lies in the field of general production supervision.

The book's only weakness is its lack of completeness, and this was probably intentional in order to further its object of simplicity. It does seem unfortunate, however, that the author did not include at least a simple discussion of the basic concepts of diffusion and the many applications to absorption, desorption, and material transfer. A short explanation of the mathematics involved in the derivation of one or two basic equations would further the understanding and acceptance of the many formulas and equations which are presented without any indication of their background.

The particular merit of the book lies in its basic soundness, simplicity, and practical approach. The inclusion of many excellent problems, which are not difficult but which cover the field adequately, makes the book invaluable as a review text. The tables, charts, and diagrams throughout the text and in the appendix are well chosen and help in the solution of many problems. The book is highly recommended for intensive and recurrent study by practical men, production supervisors, and chemical engineers in need of review.

HARVEY M. MERKER

Petroleum Refinery Engineering. *Wilbur L. Nelson.* 2nd ed. 682 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1941. Price, $6.00.

NELSON'S "Petroleum Refinery Engineering" is well known throughout the industry and technical schools because of the excellence of the first edition of 626 pages which appeared in 1936. The second edition follows the same plan and includes substantially the same material.

Three chapters have been added to include modern developments not treated in the first edition. Chapter 18 of 26 pages on Rebuilding Hydrocarbons includes a brief thermodynamic treatment of equilibrium relations, a discussion of reaction velocity, and a description of the chemistry of alkylation, dehydrogenation, sufficient for the average student or reader of general interest. The sections of the desalting of crude oil and waste water disposal constitute the new material in the new Chapter 20 titled Auxiliaries to Processing. Chapter 27, 10 pages, on Solvent Treating is entirely new.

Perhaps the most important additions are the inclusion of more modern relationships in the physical properties of petroleum and the abbreviated petroleum tables included as an appendix. These additions greatly improve the book as a text and make it far more useful to the practicing engineer.

Other charts have been revised with corresponding improvement in accuracy. The inclusion of a rather complicated procedure for calculating fractionating towers operating on petroleum is interesting in view of the complete omission of any method for calculating the columns operating on complex volatile hydrocarbons, widely used in the natural gasoline industry and in the production of the pure compounds required for alkylation and similar reactions.

Nelson's is the only book of its kind—a proved complete text and reference book brought up to date in the second edition. It should find as wide use as the first edition which set a new standard for petroleum-refining texts.

GEORGE G. BROWN

Price, Priority Index Published

OFFICIAL texts of over 600 OPA and WPB price schedules, limitation orders, allocation rulings, preference ratings, amendments, and interpretations have been made available by the *New York Journal of Commerce* for distribution. A "Price and Priority Index" of all existing government regulations covering a wide product range from acetone to zinc has been compiled for handy reference purposes.

OPA price schedules were inaugurated in the machine tool industry over a year ago and are now in effect on well over 100 products. "M" orders regulating the flow of materials came along shortly afterward and remain in effect despite the abolishing of OPM. Limitation orders restricting the output of manufactured goods were first applied on motor trucks in August 1941. Adjustment to a wartime economy hit its peak in mid-February when as many as 18 different orders were issued by the various government agencies on a single business day.

Individual texts as published in the columns of the *Journal of Commerce* are available in single copies or bulk quantities. Copies of the complete index may be had without charge by addressing the *New York Journal of Commerce*, 63 Park Row, New York, N. Y.

Priorities as Related to the Chemical Industry

A NEW technical bulletin, "The Priorities System as Related to the Chemical Industry", has been issued by the Calco Chemical Division, American Cyanamid Co. The bulletin summarizes the various controls which have been established by the War Production Board, and contains an index of the commodities on which M, P, L, and price schedule numbers have been issued.

Copies of this bulletin may be obtained by writing Calco's Advertising Department, Bound Brook, N. J., and asking for Technical Bulletin 648.

Journal of Physical Chemistry for March

THE *Journal of Physical Chemistry* for March contains the following articles:

Annual Report of Explosives Division

SINCE the mineral industries consume approximately 72 per cent of all industrial explosives manufactured in the United States, prevention of mine accidents involving explosives has been a chief concern of the U. S. Bureau of Mines since 1910, according to the annual report of its Explosives Division. The scope of such investigations has been widened in the past two or three years to include many factors directly connected with national defense and the war program. Report of Investigations 3602, "Annual Report of the Explosives Division, Fiscal Year 1941" by W. J. Huff, may be obtained by writing to the Bureau of Mines, Washington, D. C.

Conservation of Journals

THE American Library Association has created the Committee on Aid to Libraries in War Areas, headed by John R. Russell, librarian of the University of Rochester.

One of the most difficult tasks in library reconstruction after the first World War was completing foreign institutional sets of American scholarly, scientific, and technical periodicals. The committee is now endeavoring to avoid a duplication of that situation.

Many sets of journals will be broken by the financial inability of the institutions to renew subscriptions. As far as possible they will be completed from a stock of periodicals being purchased by the committee. Many more will have been broken through mail difficulties and loss of shipments, while still other sets will have disappeared in the destruction of libraries. The size of the eventual demand is impossible to estimate, but requests received by the committee give evidence that it will be enormous.

With a paper shortage imminent, attempts are being made to collect old periodicals for pulp. Fearing this possible reduction in the already limited supply of scholarly and scientific journals, the committee hopes to enlist the cooperation of subscribers to CHEMICAL AND ENGINEERING NEWS in preventing the sacrifice of this type of material to the pulp demand. It is scarcely necessary to mention the appreciation of foreign institutions and scholars for this activity.

Questions concerning the project or the value of particular periodicals to it should be directed to Wayne M. Hartwell, Executive Assistant to the Committee on Aid to Libraries in War Areas, Rush Rhees Library, University of Rochester, Rochester, N. Y.

Manual on Phosphates

FOR those interested in superphosphates and other phosphorus carriers, "A Manual on Phosphates" by Vincent Sauchelli presents facts and data from many reliable authorities in nontechnical language.

The 94-page booklet contains a brief discussion of phosphorus as plant food, sections on mineral, organic, and by-product phosphates, reviews of experiment station results showing the importance of phosphorus in high value crops, a section on granulation which quotes several leading agricultural authorities on the subject, and three articles on practices and processes of the fertilizer industry reprinted from trade journals. The book concludes with miscellaneous information supplied in question-answer form.

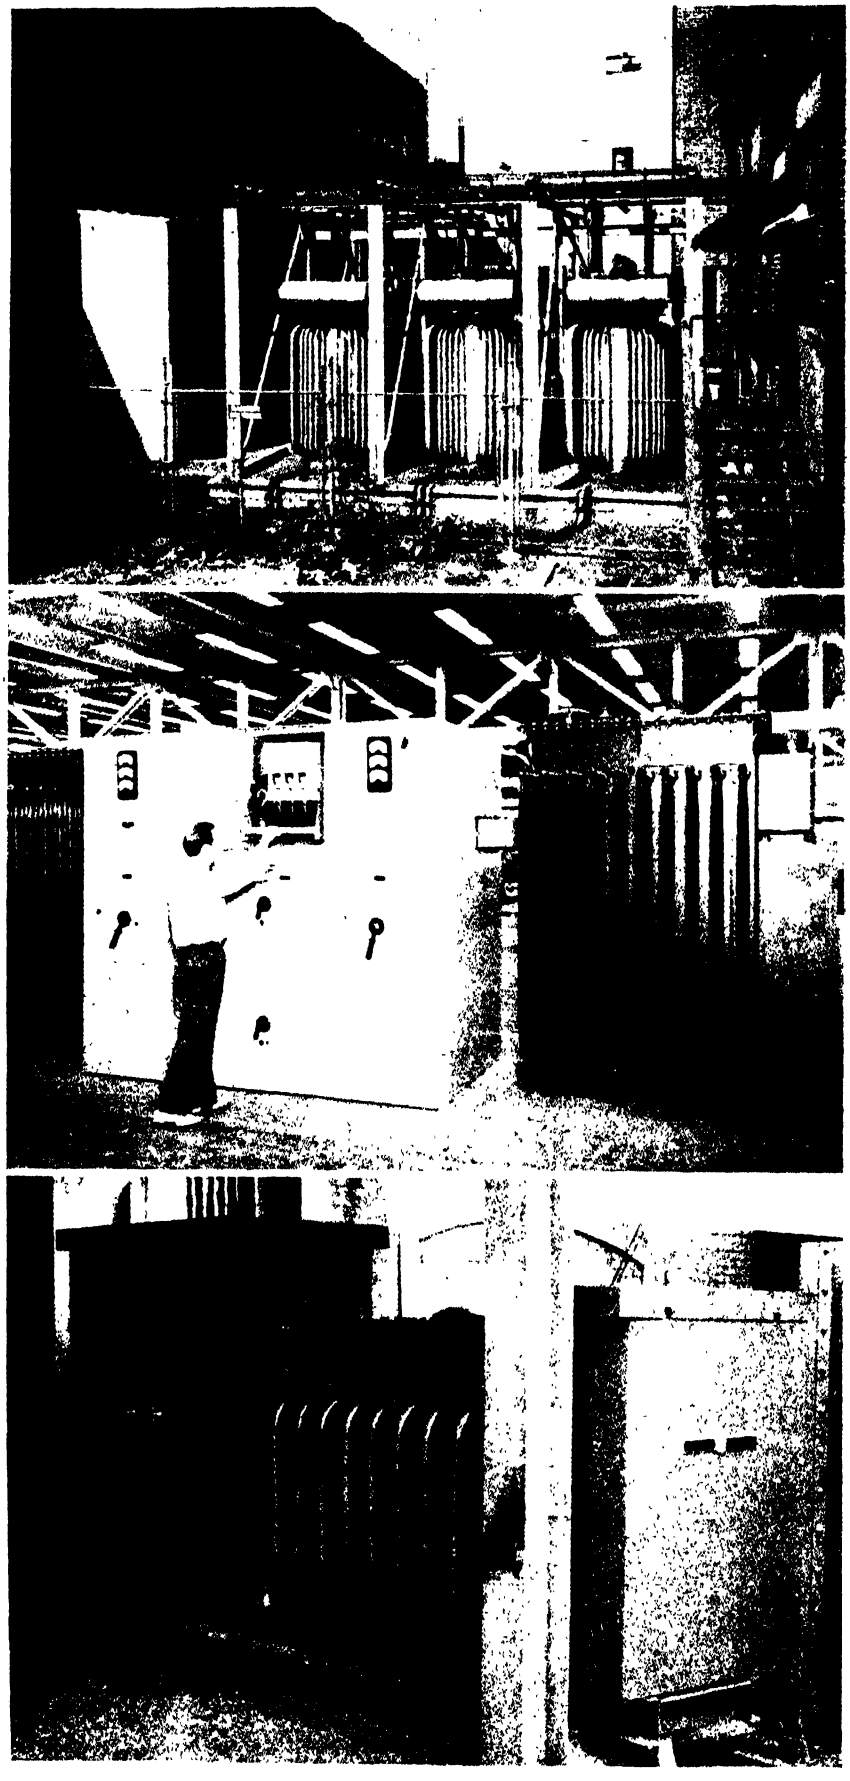
Originally compiled for its own organization, the manual has now been published by the Davison Chemical Corp., Baltimore, Md., for complimentary distribution.

G. E. Introduces New Power Distribution System

A NEW electric power distribution system for industrial plants which will save the Nation many tons of vital copper and other strategic materials and enable defense plants to make speedier installations of power equipment was announced by the General Electric Co. at a meeting of business paper editors in New York, January 23. The new system, named the load-center power distribution system, would save the Nation upwards of 5,000,000 pounds of copper and steel if it were installed in all expansions proposed and underway for 1942.

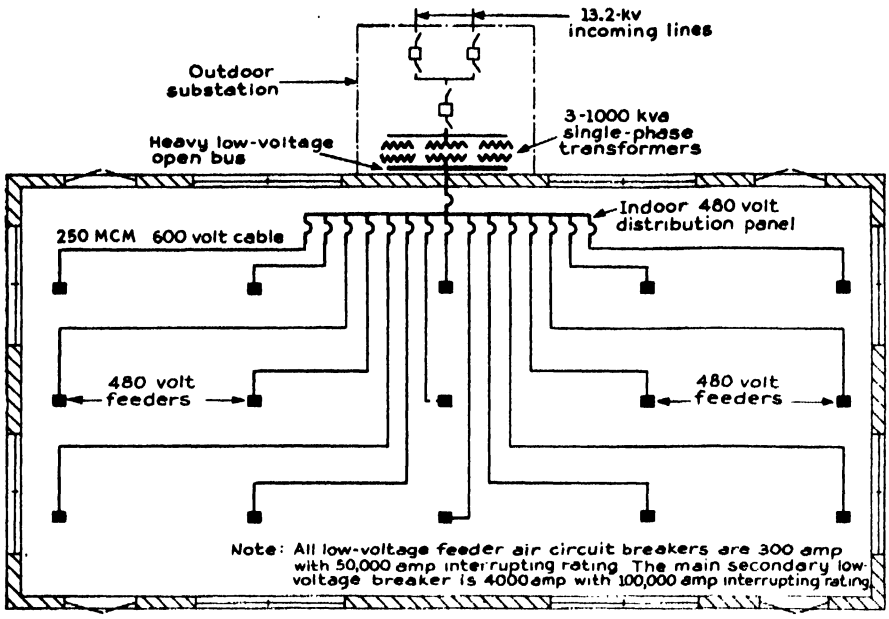
On a medium-size factory with a power demand of 3,000 kv.-amp., using its voltage at 480 volts supplied from two utility 13,200-volt lines, it has been estimated that 7,800 pounds of steel, 11,500 pounds of copper, and 1,300 pounds of other materials can be saved—all vital to the war program. This means a saving of $12,000, or 21 per cent over the more complicated, outmoded systems.

The load-center power distribution system is characterized by the distribution of electric power directly to the production area, or load center, and is there stepped down to the voltage at which it is used. Short secondary cables then feed power to motors, lamps, and other equipment.



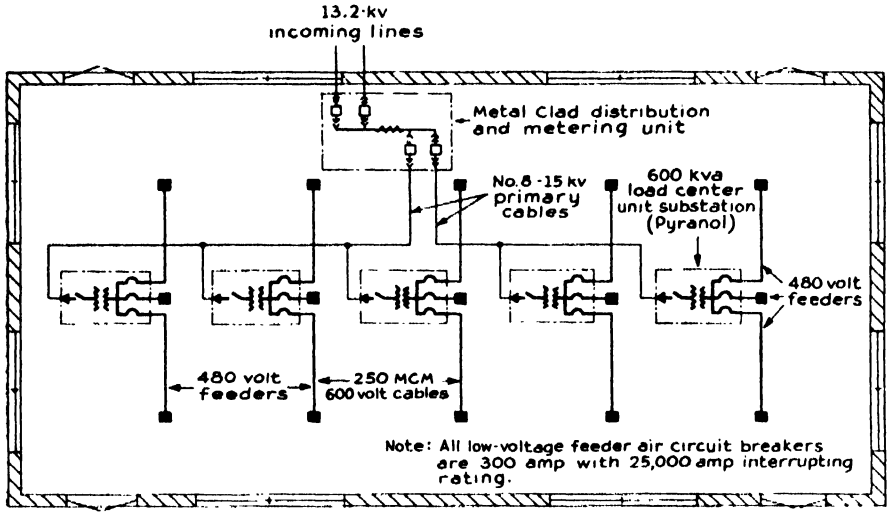
Other distribution systems usually employ a large substation to transform power from high voltage, ranging from 2,300 to 15,000 volts, down to the voltage at which it will be used. Long, heavy, low-voltage power cables then distribute the power throughout the factory to where it is to be used.

With the new system, a plant in which the total power load exceeds 1,000 kv.-amp. has several small load-center unit substations distributed throughout the plant, each near the center of its load area. This arrangement does away, largely, with the high cost and the voltage drop incidental to long, heavy, low-voltage circuits.



The two outstanding fundamental principles of load-center power distribution therefore are:

Power is distributed at high voltage to the load centers. There it is stepped down to utilization voltage and distributed to the load via short secondary feeders.



When the total load exceeds 750 to 1,200 kv.-amp., several small unit substations are used rather than a single large substation. Each small substation is located near the center of the load area, thus

Top. Old substation design, such as this installed outside industrial plant, frequently requires long secondary feeders of heavy copper originating at a considerable distance from the load center. *Center.* Load-center unit substation installed in an ordnance plant. Easily removable draw-out type secondary air circuit breakers are shown. *Bottom.* Even in outdoor installations, compactness of equipment has important advantages, as in the case of this 150-kv.-amp. load-center unit substation.

Floor plan of typical installation having a large outdoor substation in which large blocks of power are transformed from high voltage to distribution voltage and then are transmitted throughout the factory through the long, heavy, low-voltage feeders.

Floor plan of a load-center power distribution system

largely eliminating the high cost and voltage drop of long, heavy, low-voltage circuits.

Though load-center power distribution as such is not new, having been used successfully in the utility field, the recent development of standard fully enclosed and protected substation equipment, specially designed for installation in production areas, has opened the way for industrial use of this flexible, material-saving system.

Several factors combine to effect material savings. Because the low-voltage feeder runs are short, less secondary cable is needed. The transmission of power from a large substation to the production area by low voltage, as in the old system, requires many times the copper needed to supply the same amount of power by high voltage to the load-center unit substations. Since the smaller transformers of the load-center unit substation need less secondary short-circuit current, smaller feeder breakers can be used. Instead of an outdoor switching station, a small, compact, metal-clad structure is used.

In times of rapid plant expansion, as characterized today, it is often necessary for the power system to be in and working before expansions or new plants are completed. In the new system unit substations are completely wired and built in the factory and reach installation sites practically ready for operation. The old power systems require accurate forecasting of the location and magnitude of the load, to determine the best location for the large outdoor substation. It is also necessary to provide a "cushion" for future load growth. With the new load-center equipment, units can be placed right on the production floor where needed and additional units added when and where wanted disturbing the operating system. The load-center unit substation can be moved easily from one location to another to cope with changes in electrical demands which accompany changes in manufacturing technique.

Savings in Material with Load-Center Distribution

	Apparatus	Cable	Total
	Pounds		
Steel	4,800	3,000	7,800
Copper	400	11,100	11,500
Others	−1,200	2,500	1,300
Total	4,000	16,600	20,600

Savings in Cost with Load-Center Distribution

	Old	Load Center	Load Center Savings
Primary switchgear	$12,000	$13,100	−$1,100
Substations	34,400	27,500	6,900
Cable[1]	10,100	3,900	6,200
Total	$56,500	$44,500	$12,000

[1] Includes primary cable.

Substitute for Chlorinated Solvents Developed

An improved wetting and emulsifying agent, Dresinate, for use with all types of alkaline metal cleaners has been developed by the Research Department of Hercules Powder Co., Wilmington, Del. The new material assists aqueous alkaline solutions in certain applications to replace some of the chlorinated solvents, now scarce because of the chlorine shortage, and is cited by the company as a possible response to WPB's recent request that metal fabricators investigate cleaning methods which use no chlorinated solvents.

The penetrant, a finely divided, uniform powder, is available in practically unlimited quantities at a lower cost than the common emulsifying agents used by the metal cleaning industry, the company says. Addition of 3 to 15 per cent of Dresinate to an alkaline cleaning solution, while it reduces the alkalinity slightly, nevertheless increases the detergency of the solution. The material can be mixed with alkaline cleaners without special equipment since it is a dry powder, readily and completely soluble in water. Alkaline solutions containing the material are rapidly rinsed from metals, speeding the time required for the cleaning operation, according to Hercules.

Business Statistics

We are indebted to the Manufacturing Chemists' Association, 608 Woodward Bldg., Washington, D. C., for the following figures showing business conditions.

Monthly Statistical Report on Business Conditions

Cuba Exports Crude Glycerol, Imports Refined

Cuba exports crude glycerol to the United States and imports the refined product from this country, Argentina, and Mexico. The largest consumption in Cuba is in toothpaste manufacture.

Although no official Cuban import figures on refined glycerol are available, exports of the crude product to the United States showed an annual average of 1,272,600 pounds for 1937-40. In 1940 such imports from Cuba by the United States amounted to 2,950,700 pounds valued at $219,600, while for the first nine months of 1941 imports stood at the same figure as for the whole of 1940 and had a value of $223,100.

The board of directors of the Swedish Norrbottens Jarnverk AB has recommended erection of a basic slag plant to produce approximately 10,000 metric tons annually.

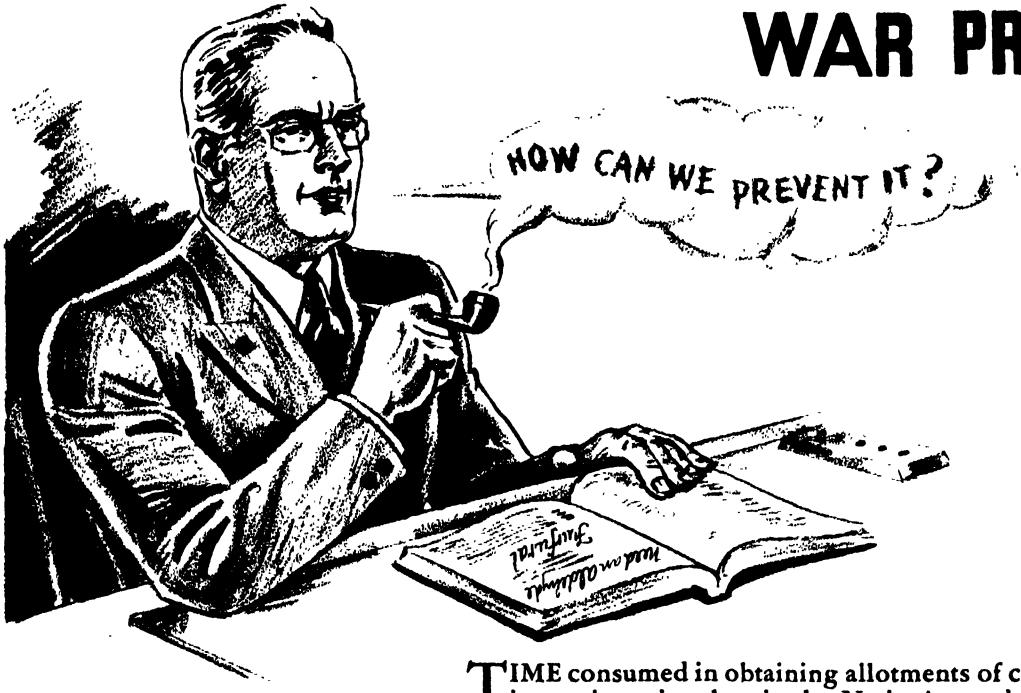
Chemical imports valued at $275,000 were reported from the Gold Coast of Africa for the first eight months of 1941, compared with $288,700 for the same period of 1940, according to the U. S. Department of Commerce.

Sulfuric Acid Used Widely by Industries of Ecuador

Wide use of sulfuric acid in the industries of Ecuador is reported by trade advisors in that country, who add that formerly Germany and the United Kingdom supplied all imports. The acid is used in tanning, shoe manufacture, bleaching and dyeing cotton cloth, dyeing woolen yarns, drug manufacture, deoxidation baths for metal plating, and manufacture of small tin and other metal objects.

U. S. Is British Kenya's Top Pyrethrum Customer

Kenya, British African colony, shipped 620 tons of pyrethrum flowers in October 1941. Only about 40 tons went to destinations other than the United States. Shipments during July through October amounted to 2,246 tons, of which 1,880 were exported to the United States.



New Plaskon Laboratory

Newest among laboratories in the plastics industry, the research and engineering building of the Plaskon Co. was formally dedicated in Toledo on February 27, in the presence of 165 leaders of the industry. E. R. Weidlein, director of Mellon Institute, made the principal opening address.

The laboratory, which is under the direction of A. M. Howald, sets several new standards. The proportion of its space, 42.5 per cent, which is devoted to engineering and pilot plant is unusually large. Separate laboratories all open directly off the central engineering space. Special accommodations have also been built for engineering on customer problems. Pure research will be prosecuted in its own department. The technical library of many thousand volumes is the only one in its field in this region. The laboratory has 15,000 square feet and 250,000 cubic feet. Twenty-five technologists will staff it.

ARE MATERIAL SHORTAGES HINDERING YOUR WAR PRODUCTION?

TIME consumed in obtaining allotments of critical and strategic materials is precious time lost in the Nation's production effort. Your patriotic duty is to bend every resource to ease the strain on those strategic materials. So it is time to get acquainted with —

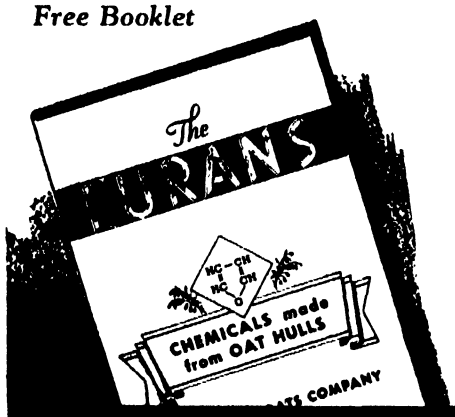
Furfural

The Furans

FURFURAL
FURFURYL ALCOHOL
TETRAHYDROFURFURYL ALCOHOL
HYDROFURAMIDE

Here is a ***plentifully available*** aldehyde made in the center of the Nation from domestic raw materials. In many cases it proves to be more than a mere substitute. For example, enterprising resin manufacturers find that in phenolic resins, Furfural makes a pound of phenol go further.

Typical properties of this compound include:



Boiling point	157–67 °C.
Specific gravity	1.161 (20/20)
Freezing point	—37 °C.
Flash point (open cup)	56 °C.
Color	Straw yellow to amber

It is miscible with most organic solvents except petroleum hydrocarbons and glycerol. Water solubility at 20 °C. is 8.3%. It disperses cellulosic derivatives such as nitrocellulose and cellulose acetate.

Properly handled Furfural is amazingly stable. To many individuals it comes as a surprise that in at least one field of application it is heated repeatedly to temperatures of 400 °F. and above without decomposition of consequence.

As a selective solvent, resin ingredient, preservative, general solvent, light sensitive agent, adhesion improver, wetting agent, stain, and resin dispersent you must not overlook Furfural.

CHLORAMINE-B

Sodium N-chlorobenzenesulfonamide

PROPERTIES:

White flat glistening plates, free flowing, and containing 29+% available chlorine. The solid material is stable to light, air, and moderate heat.

The water solubility at 20°C. is 20%, and solutions are stable if protected against direct sunlight. Chloramine-B is almost neutral in character, but is compatible with alkalies, both as solid mixtures and in solution.

Highly effective as a germicide, but not appreciably toxic or irritating to living tissue. Adapted for use in aqueous solutions, particularly at temperatures above 45°C.

AVAILABILITY:

At the present time Chloramine-B can be furnished from our pilot plant in small quantities for use in research and development work. Commercial quantities are expected to be available in the future.

SAMPLES AND INFORMATION:

We will welcome the opportunity to furnish samples and additional information. Write to:

[a] Loss.

The **Air Reduction Co.** reports the largest sales in its history, amounting to $53,566,687 and a 47 per cent increase over 1940. Federal, state, and local taxes aggregated $8,923,715 ($3.29 per share), compared with $3,607,861 ($1.33 a share) in 1940. In March 1941 the company and the U. S. Industrial Alcohol Co. joined with the Continental Oil Co. in forming Petroleum Chemicals, Inc., which has erected a research and development plant in Baltimore. In view of the large cash requirements for the company's expanding volume of business, on February 10, 1942, the company borrowed from four banks a total of $10,000,000, of which $2,500,000 is payable in four annual installments, and the remaining $7,500,000 is due at the expiration of the fifth year.

Sales of the **American Rolling Mill Co.** for 1941 amounted to $169,178,239, the largest in the company's history. Sales in 1940 totaled $112,363,529. Shipments of steel were 44.5 per cent above 1940. Cost of enlargements and new plants financed by Armco and the Defense Plant Corporation for war production will be $51,000,000.

The **Blaw-Knox Co.** reported a new high record in sales, mostly to meet demands of the war effort. Net sales were $30,799,560 in 1941, compared with $18,481,802 in 1940. Working capital was increased during the year by $1,229,355 to a total of $6,376,153, while the funded debt was reduced by $283,000, leaving a total of $2,717,000.

Sales of the **Columbian Carbon Co.** for 1941 established a new high record, an increase of 30.8 per cent over 1940. Earnings before taxes were at a peak, but there was a 146 per cent increase in federal taxes. Total sales for the first two months of 1942 have exceeded the corresponding months of 1941. Capital expenditures of $4,555,441 in 1941 exceeded those of any previous year except 1929.

The net sales of the **Fansteel Metallurgical Corp.** increased 216 per cent over 1940, while the sales of the **Vascoloy-Ramet Corp.** rose 368 per cent over the same period.

Merck & Co., Inc., during 1941 split stock 3 for 1. Production at all the company's plants reached an all-time peak by the end of the year. Consolidated net sales amounted to $39,615,121, compared to $23,766,375 the previous year. In June 100,000 shares and in December 53,690 shares of 4.5 per cent preferred stock were sold; company used $3,000,000 of proceeds to pay off bank loans.

VINSOL* RESIN

A LOW-COST EXTENDER FOR SHELLAC

The recent O.P.M. order controlling shellac sales has focused unusual interest on Vinsol Resin—a dark-colored, hard, high-melting, rather insoluble resinous material which is currently available in very large quantities at an attractive price.

Vinsol Resin is a true thermoplastic, with a melting point between 112° and 115°C., an acid number of 93, and is available in three forms: as a fine, non-caking powder, in lamellar flakes, and in lump form.

Blended with reduced quantities of shellac, in existing formulations, Vinsol Resin is already functioning to conserve shellac and to reduce over-all material costs for a few makers of plastic objects. Present limitations on purchase of shellac call for consideration of a similar step on the part of all who use this material in molding.

Vinsol Resin may provide the answer in your case. You can readily find out by mailing the coupon below. You will incur no obligation, since we feel that one vital part of our present-day responsibility to all industry is the most effective use of our materials and knowledge.

A Story—

WE DARE NOT TELL!

The scene might be in the Western Plains Country, or it might be somewhere near sea water, but regardless of location, it is a story that can't be told now. Never have such water systems been constructed. The idea is entirely new and is of major importance to the armed forces.

One fact worthy of note is that Layne was called on to drill the wells, furnish and install the pumps and to fulfill other important missions. In record time, everything has gone through on schedule. The task, though entirely new and very complicated, was handled by Layne engineers as if their usual methods had been employed.

It is characteristic of Layne to meet and conquer unusual well water supply problems. Layne engineers are trained for unforeseen eventualities. To fulfill the requirements of the Government was difficult, but promptly and satisfactorily accomplished.

Your water supply system may not involve any such highly secretive plans, but whether in the conventional or of an entirely new nature, Layne can serve you. For literature address

INDUSTRIAL PRODUCTS BY FERMENTATION PROCESSES

NOAH has received credit for one of the earliest recorded chemical discoveries. He found that under some conditions grape juice underwent a change and the resulting product, when imbibed, produced a pleasant physiological effect entirely different from that which the original juice gave. Unfortunately, as a result of continuing his testing "not wisely but too well", he has received some undesirable notoriety.

It was also observed at an early date that sometimes fruit juices underwent another type of change which resulted in the development of sourness. Milk was also found to become sour on storage. Since the resulting products found practical use, empirical methods of regulating these alterations were developed.

Not until the investigation of Pasteur was it recognized that these changes were due to the growth of various microscopic organisms. It had been noticed earlier, however, that the development of visible organisms, termed molds, also resulted in changes of the medium on which they grew.

Since Pasteur a large number of experimenters have developed methods not only of preventing, but also of encouraging, the growth of these organisms, both visible and microscopic. Others have studied the chemical changes brought about by them. It is now recognized that these reactions are similar to, or in many cases the same as, those occurring during the development of a fruit or vegetable and are natural vegetative processes.

As a result of some of these researches a considerable variety of products of industrial importance is now being manufactured by the careful cultivation of a number of these organisms. Since this is a comparatively new field, it can safely be assumed that with time the number of compounds produced by such methods will be greatly enlarged. The probability of this is increased by the fact that the raw materials for such processes are generally of American agricultural origin, thus removing any dependence on foreign products.

Chas. Pfizer & Co., Inc. has been one of the leaders in this field and is at present producing Citric Acid, Gluconic Acid, Fumaric Acid, and Oxalic Acid by such methods. From these acids a wide variety of derivatives is being manufactured. A well-trained research staff is engaged in the improvement of present processes and in the development of new products. Results in many of these latter investigations indicate that products of possible importance in a variety of fields will in time be made available.

UPPER LEFT, process piping for oil refinery
RIGHT, important links of a steam power installation

THREE different industries – a power plant, an oil refinery and a mining operation – escaped the "headaches" of new piping installation when they *sub-contracted* the prefabrication to Grinnell!

Grinnell engineers are specialists, qualified by long experience to interpret any piping problem. Grinnell plants, strategically located to serve all industries, are equipped with every last facility to prefabricate the most complete subassembly and deliver it on the job ready for fast assembly.

Save yourself a big part of the worries connected with extensions in power or process piping . . . "Give the Plans to Grinnell". That's how leading manufacturers, utilities and process plants are meeting boosted wartime demands. Write for Data Book, "Grinnell Prefabricated Piping". Grinnell Company, Inc., Executive Offices, Providence, R. I. Branch offices in principal cities.

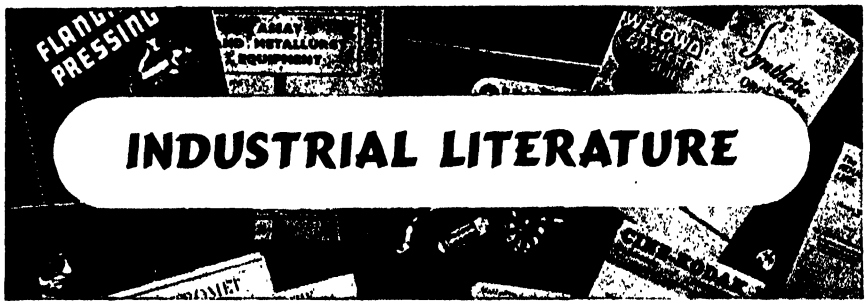
Reclamation is the clarion cry of today ... reclamation and conservation of the nation's resources vital to war production.



The illustration shown here is that of an unusual reclamation job carried out by the City of Milwaukee, Wisconsin—salvaging iron and other worthwhile materials from the refuse collected in the city's alleys. In one year 18,000 tons of iron, 6,250 tons of glass and 3,000 tons of paper can be reclaimed.

To make the job easier, faster, cheaper and more positive, a Dings High Intensity Magnetic Pulley was installed to automatically remove the iron.

If you have an iron-removal problem, no matter how difficult, submit it to Magnetic Separation Headquarters. Write today.

Dings MAGNETIC SEPARATION HIGH INTENSITY

THE DINGS MAGNETIC SEPARATOR CO., 514 E. Smith St., Milwaukee, Wis.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Acidproof Piping. This 12-page booklet contains complete data on Bell and Spigot pipes and fittings, drains, traps, and pumps. Methods of installing and caulking are given. *Bulletin 550 CEN.* U. S. Stoneware Co., Akron, Ohio.

Boiler Mounting and Insulation. This 16-page illustrated booklet is devoted to the installation of horizontal return tubular boilers. Various methods for laying firebrick are discussed. *Form 20E4 CEN.* Ramtite Co., Division of S. Obermayer Co., 2563 West 18th St., Chicago, Ill.

Brass and Bronze Castings Data. A 20-page bulletin gives physical and metallurgical properties related to various casting formulas. *Practical Data on Brass and Bronze Castings Bulletin CEN.* Hammond Brass Works, 1844 Summer St., Hammond, Ind.

Centrifugal Castings. A 4-page pamphlet discusses centrifugally cast products of ferrous and nonferrous alloys. The effect of casting centrifugally is somewhat the same as that obtained through hot-forging or rolling. Among the products covered are heat-transfer tubes, conveyor rolls, digester tubes, and pump plungers. *Bulletin 4227-C CEN.* Duraloy Co., Scottdale, Penna.

Centrifugal Pumps. A line of single-stage, double-suction pumps is described in two 6-page pamphlets. These pumps are available in capacity ratings of 50 to 5,000 gallons per minute. *Bulletins 225-1 and 227-1 CEN.* Warren Steam Pump Co., Inc., Warren, Mass.

Control Instruments. A small 16-page booklet lists the ways in which 61 industries and government bureaus are using control instruments. *Solving Industrial Crimes Booklet CEN.* Esterline-Angus Co., Inc., Indianapolis, Ind.

Fine Chemicals. A 19-page booklet briefly describes properties and uses of 39 chemicals. *Fine Chemical Products Booklet CEN.* Seydel Chemical Co., 225 Mercer St., Jersey City, N. J.

Freight Cars and Fabricated-Plate Equipment. This 32-page brochure describes the products and activities of this manufacturer of freight cars and welded-plate equipment. Among the various features discussed is the method of making pressure vessels out of hot-formed rings that require the welding of a single joint, a process said to reduce internal strain. *General American Transportation Brochure CEN.* General American Transportation Corp., 135 South LaSalle St., Chicago, Ill.

Homogenized Milk. This 24-page booklet is virtually a treatise on homogenized milk. A line of homogenizing equipment is described. *Bulletin F4000 CEN.* Cherry-Burrell Corp., 427 West Randolph St., Chicago, Ill.

Hypochlorination of Water. A series of 4 data sheets illustrates different installations of equipment which automatically injects sodium hypochlorite into the system. This equipment is operated entirely by the flow of the water. *Drawings SD-460-1, 534, 571, 495-A CEN.* % Proportioneers, Inc. %, 9 Codding St., Providence, R. I.

Metal-Cleaning Compounds. A 32-page leaflet describes a line of cleaning, degreasing, and stripping compounds for the metal industries, cleaning compounds and solvents for the automotive industry, and cleaning compounds for maintenance, etc. *Leaflet CEN.* Fidelity Chemical Products Corp., 430 Riverside Ave., Newark, N. J.

Pneumatic Differential Pressure Transmitters for indicating, recording, and controlling meters are the subject of a 4-page pamphlet. Principles of operation, construction details, capacity, applications, and prices are given. *Pneumatic Differential Pressure Transmitter Bulletin CEN.* Moore Products Co., H and Lycoming Sts., Philadelphia, Penna.

Pyrometers. Greater sensitivity is said to be attained within these pyrometers by use of photoelectric cells and mirror galvanometers for both recording and controlling. This 36-page catalog illustrates construction of the instruments and many typical cases of installation. *Catalog 1101 G CEN.* C. J. Tagliabue Mfg. Co., Park and Nostrand Aves., Brooklyn, N. Y.

Quick-Operating Valves. A line of weight-operated, gate-type valves are described in a 4-page pamphlet. These valves find use in sprinkler systems, dip tank discharge, fuel line shut-off, and similar services. *Bulletin E-52 B CEN.*

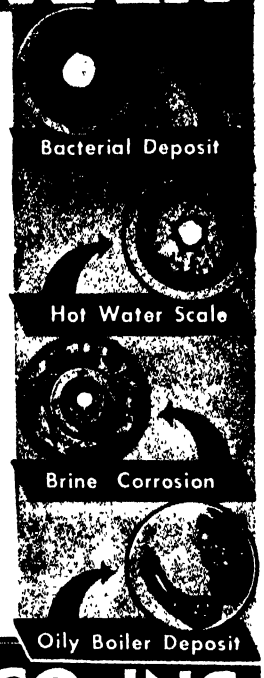
what WE READ in WATER



There are a great many stories that can be read in the various samples of water we receive. They tell of scale and corrosion in varying degrees of destructiveness. Water for cooling systems, steam and return systems, refrigerating brines . . . each has its particular story. Power plants, petroleum industries, process industries, public buildings and transportation industries . . . all have their problems.

Let us study these problems for you and tell you how Chrom Glucosate, Phospo Glucosate, and many others of our Haering products can correct these conditions, saving your materials and increasing the production of your plant.

Write for these interesting booklets:

"Organic Methods of Scale & Corrosion Control"
"Cooling Waters" • "H-O-H Lighthouse Reprints"
"The Solution of Your Proportioning Problem"

and other booklets on water treatment for Power Plants, Refrigeration Plants, Petroleum Industries, Process Industries, Public Buildings, and Transportation Industries.

CHICAGO, ILLINOIS

WE'RE WORKING FOR *HIM...*

BUT WE HAVEN'T FORGOTTEN *YOU!*

Because defense industries come first, it is becoming increasingly difficult for us to fill your orders. We are sure you understand and appreciate the problems we are up against.

But there is a bright side of the picture — for *you*. Now that we are working at top speed — day and night — we are quickly learning many new and better methods of manufacture and are steadily improving the quality of our products.

When Victory is won, our regular customers should most certainly benefit from the new standards of quality which our accelerated war effort will have produced.

Second Edition—Thoroughly Revised and Enlarged

MANUFACTURE OF SODA

by TE-PANG HOU, Ph.D.

A. C. S. Monograph No. 65

THE present acute shortage of soda ash and the consequent rapid expansion of existing plant facilities make the publication of this volume an event of the first importance not only to the soda industry itself, but to others closely related to it. New plants will be brought into production, older ones enlarged, and every effort will be made to attain maximum operating efficiency from all. It is in this connection that this book will be of particular value, for it constantly stresses the importance of efficiency, and explains precisely the best methods of attaining it.

Since the first edition was exhausted, there has been a constant demand for its revision and enlargement. With this in mind, the author has not limited himself merely to bringing it up to date, but has expanded it to embrace the entire field of soda manufacture, to such an extent that the second edition is in reality a wholly new book. This is evidenced by the fact that the revised edition contains nearly twice as many pages as the first.

No effort has been spared to include the fullest details about all the methods of soda manufacture—LeBlanc, Trona, Solvay, and electrolytic. Production statistics, analytical methods, and detailed calculations are given in such form that they will be of ready use to plant engineers, production supervisors, and industrial executives. Special attention has been given to the mechanical requirements of the modern soda-ash plant, including one entire chapter on their layout and design, and another on the use of centrifugal pumps in the industry. Such important operating details as conditioning and control of boiler feed water and generation of power are thoroughly treated.

Dr. Hou has supervised the installation of many soda-ash plants in China, and is largely responsible for the development and modernization of the industry in that country.

Chapters

Introduction. Historical Survey of Alkali Industry and Relation of LeBlanc Soda Industry to Development of Other Chemical Industries
Natural Soda
History of Ammonia Soda Process: Statistics
Preparation of Brine: Rock Salt and Sea Salt
Purification of Brine
Burning of Limestone
Ammoniation of Saturated Brine
Carbonation of Ammoniated Brine
Working of Carbonating Towers or "Columns"
Filtration of Crude Sodium Bicarbonate (Ammonia Soda): Composition of the Bicarbonate
Composition of Mother Liquor From Carbonating Towers
Phase Rule in Tower Reactions: Graphical Representation of Ammonia Soda Process
Decomposition of Sodium Bicarbonate by Calcination
Recovery of Ammonia—Efficiency of Operation in Ammonia Still
By-Products From Distiller Waste
Allied Products of Ammonia Soda Industry
Position of Ammonia Soda Industry
Manufacture of Refined Sodium Bicarbonate
Manufacture of Caustic Soda—Chemical Process
Manufacture of Electrolytic Caustic, Chlorine, and Chlorine Products
Wet Calcination of Sodium Bicarbonate
Generation of Power for Ammonia Soda Plants
Boiler Operation and Conditioning of Boiler Feed and Cooling Water in Ammonia Soda Plant
Special Requirements of Ammonia Soda Industry
Control in Ammonia Soda Process
Losses and Consumption of Raw Materials in Ammonia Soda Process
Modifications and New Developments of Ammonia Soda Process
Chemical Analyses and Tests in Alkali Industry
Behavior of Soda Ash in Storage
Layout, Design and Location of Ammonia Soda Plant
Centrifugal Pumps Applied to Ammonia Soda Industry
Appendix, Index

REINHOLD PUBLISHING CORPORATION, 330 W. 42nd Street, New York, N. Y.

Tin Recovery

A process for recovering tin and steel from used tin cans, requiring no preparation of the cans on the part of the householder or other users of canned commodities, can now be applied to large-scale production, according to an announcement by the Metal & Thermit Corp., 120 Broadway, New York, N. Y. This company has been operating a test plant at San Francisco for the past five years.

The pilot plant is a complete unit with a capacity of over 6,000 tons. From its operations, suitable methods have been worked out for the recovery of about 24 pounds of tin oxide and almost a ton of scrap steel per ton of discarded cans. The tin oxide is readily smelted to a grade equivalent to Straits tin, the grade formerly secured from the Malay Peninsula, now in Japanese hands.

The San Francisco plant handles cans collected from the city of Oakland and nearby communities. The processing unit comprises unloading equipment, inspection station, rotary screens for dirt removal, incinerator for charring cans to destroy fat, paper, lacquer, and other combustibles and to separate the carbonaceous residue, shredding and pre-washing equipment, storage facilities, and complete equipment for continuous detinning by the alkali process.

Rough estimates indicate that about 2,500,000 tons of tin cans are discarded annually in this country and that about 1,000,000 tons of these could be economically collected and detinned, yielding about 11,000 tons of tin and 900,000 tons of scrap steel.

Detinning of tin plate clippings obtained from can companies and other sources has been a well-established industry for more than 30 years, but detinning of used cans has been impractical in peace times. The principal problems involved are those of collection, preparation, and transportation of cans.

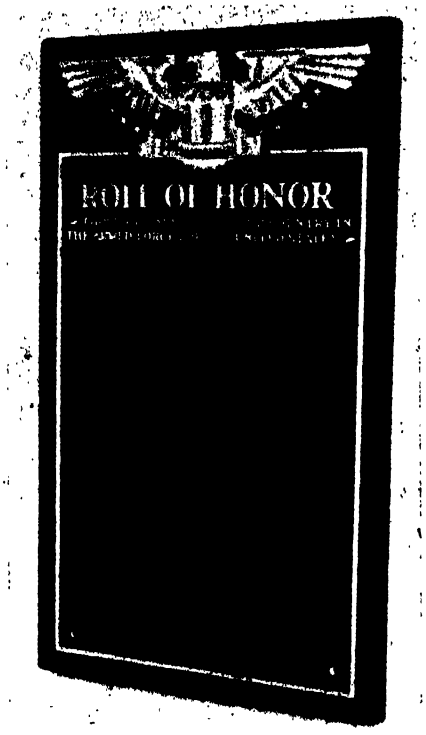
Texas Gulf Sulphur Co. Announces Record Year

According to the United States Bureau of Mines, production of crude sulfur in the United States in 1941 attained a new record of 3,139,253 long tons, a 15 per cent gain over 1940. Mine shipments increased about one third and were the largest on record—3,401,410 long tons compared with 2,558,742 tons in 1940.

With reference to operations of the Texas Gulf Sulphur Co. during 1941, Walter H. Aldridge, president, in his annual report says:



Notwithstanding shipments of more than 2,000,000 tons of sulfur during 1941, the largest in the history of the company, the stocks of sulfur above ground at the mines today are at virtually the same tonnage as a year ago. Total stocks of the company at all points, including the mines, remain in excess of 3,000,000 tons, and exceed by about 5 per cent the corresponding figure at the beginning of 1941. The Texas Gulf Sulphur Co. is prepared to produce sulfur at a materially higher rate than that of 1941, if the demand should make such an increase necessary.

Motion Pictures on Arc Welding

Six one-reel, all-color sound motion pictures designed to help speed war efforts through the faster and better training of welding operators are now under way for the General Electric Co., Schenectady, N. Y. Titled "The Inside of Arc Welding", the films are being produced by the Raphael G. Wolff Studios, Hollywood, which have evolved a new technique for picturing this difficult subject.

When completed the pictures will be made available to public, private, and industrial welding schools, as well as to other interested groups. The first of the pictures, covering the fundamentals of arc welding, is scheduled for general release about April 20. The other pictures will be available about June 1, and will deal with technique of arc control and electrode manipulation for all welding positions, using both direct- and alternating-current equipment.

Glass Used for Roll of Honor Plaque

THE new Roll of Honor plaque designed by the Pittsburgh Plate Glass Co. for plants, offices, and other organizations having employees or members serving in the armed forces of the United States provides both a temporary and permanent record of names of those serving their country.

The plaque is made of polished black Carrara glass on which the emblem is sand-carved and painted with varnish-protected gold leaf. The name of the individual company or organization is inscribed at the bottom. As employees or members depart for service their names are painted on the plaque with white or gold paint. When the list is complete, the names can be inscribed permanently by sand-blasting, rearranging them in alphabetical order if desired.

Use of glass instead of metal releases critical metals for more important war needs. The glass provides a permanent memorial that is impervious to the elements, retains its sparkling finish, does not craze, and cannot tarnish.

Anthracene Output in United Kingdom Tripled

A RAPIDLY strengthening industry based on anthracene is reported for the United Kingdom, where the output is expected shortly to triple the prewar level. Extensions under way are expected to bring production to four times the peacetime rate, with developments in the intermediate industry which will make it a competitive influence even when Continental products are again available.

Does BECKMAN pH CONTROL Pay?

Does it!

Read What Happened in Chicago!

Today minutes are priceless . . . *and so are materials!* So anything that will speed up production . . . anything that will save time in process operations . . . anything that will reduce waste and increase output, merits your immediate investigation. Beckman pH Control is doing these things—NOW . . . in thousands of different fields, ranging from electroplating aircraft parts to refining sugar . . . from speeding up chemical processes to reducing costs of waste disposal.

Trial

Sometime ago the Sanitary District of Chicago made a trial installation of Beckman Automatic pH Control in their large Stickney Plant. Months of rigid testing proved, conclusively, that Beckman pH Control makes important savings in chemicals, increases plant efficiency, reduces waste, saves time!

Repeat

So profitable was the initial Beckman installation, that the Sanitary District ordered a second Beckman Automatic pH installation for its Calumet Plant to control pH of the treating operations there.

Repeat

And now the District has ordered a THIRD Beckman Automatic pH installation for still another location in its large municipal system. There's no mistaking conclusive evidence like that!

And it is doing its job so well that one installation leads to another. For example, the Sanitary District of Chicago tried Beckman Automatic pH Control on the chemical end of its sewage-treating operations . . . found it saved not only time and chemicals, but increased plant efficiency and decreased operating costs so successfully that a *second* installation was ordered for another plant . . . and now a THIRD installation has been ordered for still another location. *Clear-cut evidence like that tells its own story!*

WHAT ABOUT *Your* PLANT!

Do you use water or water solutions *anywhere* in your plant? . . . in chemical or electro-chemical processes? . . . in boiler feed? . . . in waste disposal? . . . *anywhere?* Then investigate NOW what Beckman pH Control can do toward helping you do your job better — faster — with less waste! Our research staff will gladly study your problem and can perhaps suggest how others in your field are now using Beckman pH Control to cut costs . . . *save time!*

Beckman THE LEADING NAME IN pH

Acoustic Fences Aid Guards

TINY robot sentries, many times more efficient than men in weather where visibility is low, are aiding human guards along the miles of high wire fences that enclose some of the country's greatest war production plants. In addition to extending the hearing range of guards, the acoustic fence apparatus provides an ever-ready checking-in system. A watchman need only step up to the fence and report in an established code by tapping. The messages can be received through a loud speaker, made to record themselves silently on moving tape or drum showing the exact time, arranged to ring a bell, or relayed automatically to police or military headquarters. The system, invented by a du Pont engineer, is being manufactured for general use by Automatic Alarms, Inc., Youngstown, Ohio, where all inquiries should be sent. Its cost is said to be such that even small factories may install it.

New Chemicals Manufactured

MANUFACTURE of thioglycolic acid and its salts in quantity at commercial prices is announced by Martin Laboratories, Inc., 117 West 63rd St., New York. The chemicals, made by an entirely new process, patents applied for, are thioglycolic acid, sodium thioglycolate, monoethanolamine thioglycolate, and calcium thioglycolate.

Foster D. Snell, Inc., Expands Laboratory Facilities

INCREASING laboratory space by more than 50 per cent in the past year, Foster D. Snell, Inc., Brooklyn, N. Y., has added substantially to its facilities for consulting and research services. Aside from additional unit laboratories, the space is devoted to an enlarged constant-temperature room, additional photographic and photomicrographic equipment, another animal room which permits the handling of almost double the number of experimental animals, an enlarged library, and additional facilities for handling sensitivity tests on human subjects.

Present plans call for another laboratory outside of New York devoted solely to furniture and furniture finishes.

New Invention Permits Tight Seal between Iron and Glass

NEED for nickel and cobalt, critical war metals, is eliminated by a new development for making tight seals between iron and glass, patented by Albert W. Hull and Louis Navias of the General Electric Research Laboratory, Schenectady, N. Y.

Platinum was used in the first electric lamps, since it has nearly the same rate of expansion as the glass then employed. Various substitutes for platinum were devised, satisfactory for lamp seals although not adapted to the large seals used for powerful vacuum tubes. Dr. Hull and others developed special nickel-iron-cobalt alloys for this latter application.

The new invention of the G. E. scientists permits tight seals to glass without drawing on the limited supplies of nickel and cobalt. They have devised a series of glass compositions which can be used with iron and certain iron alloys. One consists of 45 per cent silicon dioxide, 14 per cent potassium oxide, 6 per cent sodium oxide, 30 per cent lead oxide, and 5 per cent calcium fluoride. The rate of expansion is very close to that of iron.

In seals using this series a further and separately patented invention of Dr. Navias also proves useful. When a glass containing lead is sealed in contact with iron, some of the lead atoms migrate from the glass into the metal. This weakens the joint and may let air leak into the tube. Dr. Navias proposed placing a thin layer of lead-free glass directly over the metal, then sealing the lead-containing glass to that. The thin glass layer prevents the lead from reaching the iron, yet it is not thick enough to crack.

THESE two tanks in the plant of Carnegie-Illinois Steel Corp., Duquesne, Pa., were lined with two courses of acid-proof brick laid entirely in Penchlor Acid-Proof Cement.* They are used for pickling steel bars where the mechanical as well as the chemical action is especially severe.

Due to their large size—45′ x 5′ x 4′—both tanks were built with expansion joints in their lining. Inspection after a year's constant use showed absolutely no signs of permanent expansion of the lining. Both bricks and cement are still in perfect condition.

This is typical of the way Penchlor Acid-Proof Cement stands up in tough service. It is inert to all acids except hydrofluoric. It adheres strongly to such materials as brick, steel, glass, carbon, lead, and rubber. Quick-setting and self-hardening, it speeds up acid-proof construction.

For extremely abrasive conditions, or where thermal shocks are extreme, Asplit Cement* provides utmost durability and prevents spalling of bricks. It is a synthetic resin that far outlasts other types of acid-proof construction.

Penn Salt has been engaged for a great many years in the manufacture of acids and alkalies. We have naturally had considerable experience in the use of cements to resist corrosion, and are in a position to give technical advice. We will welcome inquiries on your problems.

Dangers of Blasting Caps Emphasized

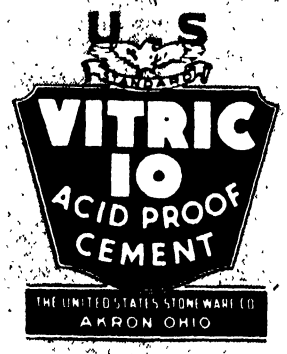
ALL users of explosives are asked to cooperate in protecting children from the dangers of playing with blasting caps. Although warnings against allowing these caps to fall into the hands of children are contained in each box of caps, records show that many of them are left lying carelessly about. Those who use explosives can make themselves the most important factor in the movement to save children from injuries and sometimes death by making sure that the caps are carefully stored where boys and girls cannot get them.

Accidents to children from playing with blasting caps decreased in 1941 as compared with 1940. The desire this year is to eliminate these dangers as completely as possible. A limited number of posters and explanatory folders are available from the Institute of Makers of Explosives, 103 Park Ave., New York.

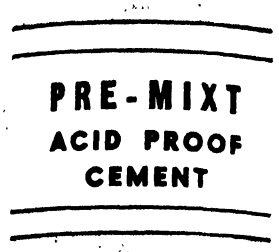
General Motors War Program

THE General Motors Co., Detroit, Mich., has announced a three-point program to keep the planes, tanks, and guns of the United Nations at the highest possible efficiency. The company will help train mechanics required to keep the force in action by maintaining schools for Army and Navy instructors, place its own engineers in the field to expedite reports on operating experience, so that its war products can be improved constantly, and assist the Army and Navy in having replacement parts on the spot when needed.

The training job calls for expenditures totaling not less than $5,000,000 for the current year and will involve training thousands of instructors throughout the country.



New Process for Latex



A NEW method of processing is said to extend the volume of latex from 50 to 300 per cent (depending upon the use to which it is to be put), while retaining the major characteristics of the original product as well as a good proportion of its natural strength. After being extended by this new process, normal (38 per cent) latex is returned to its owner in the form of a 37 per cent concentration, and concentrated (60 per cent) latex is returned in the form of a 55 per cent concentration.

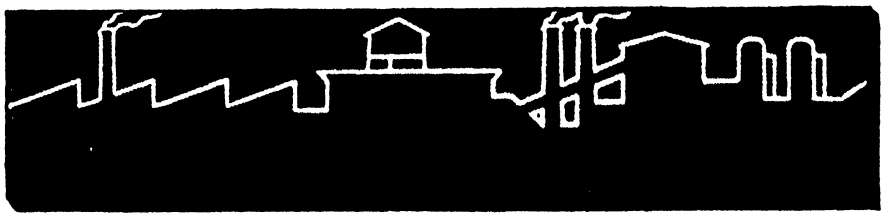
Developed in the laboratories of the Union Bay State Co., 50 Harvard St., Cambridge, Mass., the process makes use of a filler material of fine size that blends extremely well with the rubber particles. This, together with the filler material's many points of similarity to latex, makes the extended product readily adaptable to most cementing, impregnating, and coating operations.

ACID-PROOF CEMENTS

Save You Days

"Vitric-10" Quick-Setting Acid-Proof Cement hardens by internal chemical set into a strong, acid-proof, granite-like structure of permanent durability. Initial set occurs in 25-30 minutes.

All Are Self-Hardening



"Pre-Mixt" comes in powder form and requires only mixing with water on the job. From the standpoint of convenience and general utility, "Pre-Mixt" is without equal.

All Are Quick-Setting

"Super-Vitric" hardens thruout the mortar joint by chemical reaction rather than evaporation. Forms dense, porcelain-like structure of minimum porosity.

"U. S. Stoneware" Acid-Proof Cements adhere strongly to brick, steel, glass, lead and rubber.

THE U. S. STONEWARE CO.
WORKS (SINCE 1865) AKRON OHIO

Diglycol Stearate S

NICKEL alloys can be drawn, stamped or formed, and annealed without cleaning by using a dispersion of Diglycol Stearate S in water, reports the Glyco Products Co., Inc., 230 King St., Brooklyn, N. Y. Diglycol Stearate S is a white, waxlike solid, dispersible in water, with a melting point of 51 to 54° C. It will fire off completely at any annealing temperature (400° F. minimum) in an atmosphere of oxygen or hydrogen.

For example, an alloy composed of 78 per cent nickel, 4 per cent manganese, copper, and iron was drawn with a 2 per cent dispersion of Diglycol Stearate S, as follows:

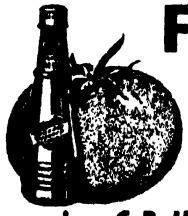
Flat plate approximately 5 inches square
First draw: 2 inches deep, 1 1/2 inches in diameter (anneal)
Second draw: 3 inches deep, 1 inch in diameter (anneal)

For drawing and stamping, a 1 per cent concentration sprayed is usually sufficient as a lubricant. Even lesser concentrations can generally be used to replace sulfonated oils which are used as coolants in stamping. In all cases there was no residue on firing.

Solenoid-Operated Butterfly Valve

AN APPLICATION of the butterfly valve for emergency duty is announced by the R-S Products Corp., 4530 Germantown Ave., Philadelphia, Penna. This solenoid-operated valve provides two-position control, either automatic opening or wedge-tight shut-off in case the electric power fails or is turned off in any war emergency. In an open position the butterfly vane is held open by the magnetic action of the solenoid. In case of fire due to incendiary bombing, for instance, the valve in a gas or chemical line would be set for automatic closing. Should explosive or poisonous gases escape, automatic opening of an air-pressure line would minimize the danger of personal injury or property damage. The valve itself can be constructed of any metal alloy and in various sizes for air, gas, steam, oil, hydraulic, and other services.

Motors and Control Slide Rule



A POCKET-SIZE "slide rule" selector for electricians, plant maintenance men, and others interested in the selection of electric drive equipment has recently been announced by the Westinghouse Electric and Manufacturing Co., East Pittsburgh, Penna.

To guide in the selection of the proper type of motor for each of 44 industrial applications, a convenient table lists the various uses and indicates which of the four principal types of alternating-current motor should be selected. The specifications, performance ratings, and control classes for the required type are readily determined by making the corresponding setting on the slide.

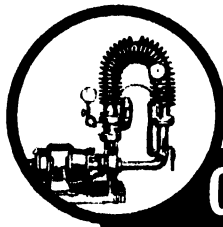
Tung Oil Substitute for Wrinkle Finishes

ADAPTATION of Kellin, new tung oil substitute, by New Wrinkle, Inc., makes it feasible and economically possible for the first time to produce a satisfactory commercial wrinkle finish from a linseed oil base. This new formulation was developed and tested within two weeks following announcement of Kellin by Spencer Kellogg & Sons, and in the face of years of varnish manufacturing practice and a general opinion in the paint industry that linseed oil was inferior to tung oil as a base for wrinkle finish. The new formula was developed by William A. Waldie, technical director, New Wrinkle, Inc., in the laboratory at Dayton, Ohio.

Use of Kellin for the production of wrinkle finish is particularly significant at this time because wrinkle is specified as standard for many pieces of war equipment. Thus thousands of gallons of tung oil, a critical material now that importations from the Far East have been discontinued, can be released for other purposes. The new Kellin-Wrinkle formula has been announced by New Wrinkle, Inc., to its more than 160 manufacturing licensees.

Faster Heat Speeds Catsup Processing at P. J. RITTER plant

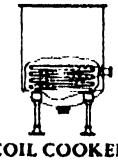
using C-B High Pressure Condensate Return



The P. J. Ritter Co., of Bridgeton, N. J., produces a well known line of catsups, tomato products and other foods. The recent application of two Cochrane-Becker high-pressure condensate return systems to their coil cookers has resulted in (1) saved process time; boil reached in half the time and concentrating time reduced 15 percent (2) improved color and better quality control (3) more even boiler operation (4) higher steaming capacity of boilers (5) 13 percent less fuel.

Write for publication on 3025

Two C-B units installed at P. J. Ritter Co. plant at Bridgeton, N.J.



The Cochrane-Becker System is based on the action of an eductor, which is constantly energized by a jet from a specially designed pump and given balance and continuity by a loop, forming a closed circuit to insure positive priming. Condensate is therefore returned to boiler at high pressure and temperature.

Pneumatic Differential Pressure Transmitter

A PNEUMATIC differential pressure transmitter has been developed by Moore Products Co., H and Lycoming Streets, Philadelphia, Penna., to provide a simple method for accurately measuring and amplifying small differential pressures and pneumatically transmitting this amplified value to a receiving meter calibrated in the units measured. The most important characteristic of the method is the true linear function and constant ratio of amplification. The ratio may be varied to suit specific requirements, but depends only on a fixed ratio of bellows areas and does not use any levers or sliding members which might cause friction errors.

The differential sealed-in unit is made with phosphor bronze or stainless steel welded bellows. A separate pilot is provided where long distances of transmission are required.

In operation a high pressure tap connects with the inside of a large bellows and a low pressure tap connects to the opposite side. Regulated and filtered air is admitted through a removable restriction screw into a small bellows chamber inside the large one, and this air discharges through the exhaust nozzle in the small bellows. Any increase or decrease of differential pressure across the large bellows moves it to or from the exhaust nozzle, causing an increase or decrease of the air balancing pressure in the small amplifying bellows. This pressure automatically maintains all the bellows in a position of

INVESTIGATE *Resin and Lacquer Emulsions* as LATEX SUBSTITUTES

—Extenders and Modifiers

Resin and Lacquer Emulsions have been finding an ever-widening use in many industries. They have proved invaluable in replacing other materials in adhesives, modifiers, binders and fillers, grease proofing, waterproofing, sizing, impregnating, coating, color dispersions and innumerable other uses.

In the Rubber Industry these emulsions are being used today as *Latex Modifiers* and *Complete Latex Replacements* to extend, thicken, stabilize, increase penetration, improve resistance to acids, oils and solvents, and to mechanical coagulation, etc.; *in Coatings* to produce adherent pigmented coatings and as intermediate coats for lacquer on rubberized cloth; in *Rubberizing* textiles; in *Latex Treated Papers* to increase strength and improve ageing; in *Adhesives*, for paper, for leather to cloth, and cloth to cloth.

These are just a few of the known applications in the rubber field. Undoubtedly in your own plant you will find many uses for these emulsions to improve your products and extend the supply of the vital materials, LATEX and RECLAIMS.

Our Technical Staff will be glad to make recommendations to meet your specific problems. Write today for additional information.

AMERICAN RESINOUS CHEMICALS CORPORATION

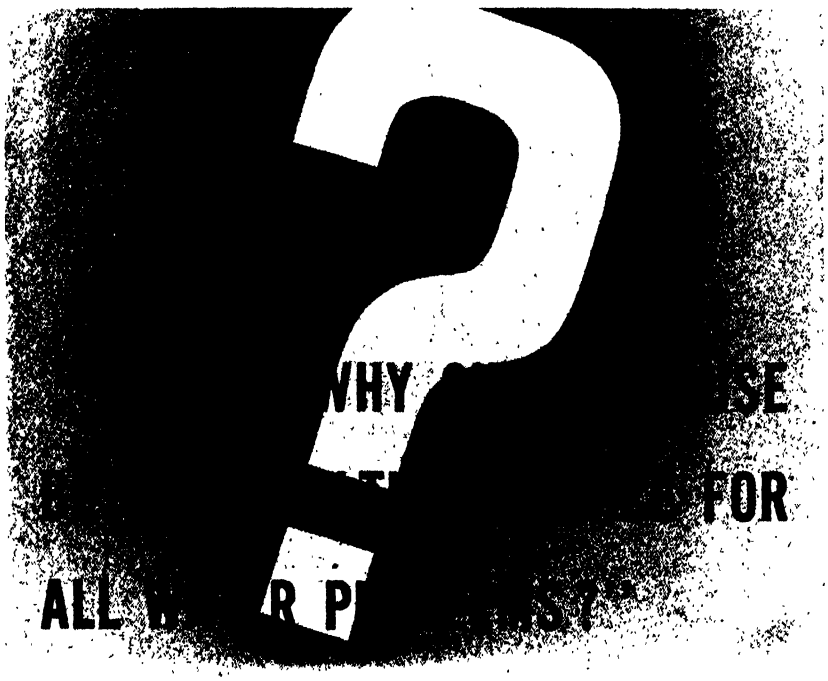
MAIN OFFICE and LABORATORIES, PEABODY, MASS.

Factory Branches: Newark, N. J. and Chicago, Ill.

A Few of Our Products of Interest to the Rubber Industry

•



ALKYD 17-B A permanently tacky, alkyd type resin emulsion containing 40% solids. When mixed in equal proportions with normal latex, the mixture for all practical adhesive purposes is indistinguishable from latex.

ALKYD 18 An alkyd type resin emulsion which is non-yellowing and non-oxidizing. Film is water-white and non-tacky. Preferred where slight oxidizing action may be considered harmful to rubber. Extender for latex in coating, combining and impregnating processes.

EMULSION 58-8 A series of emulsified elastometers containing up to 65% solids. Recommended for use as full latex replacements in impregnation and combining.

PIGMENT BASES Concentrated aqueous dispersions of pigments in resin bases, available in all shades and viscosities, suitable for spreading, spraying, etc.

Also Acrylic, Vinyl, Maleic, Phenolic, Hydrocarbon, Ethyl Cellulose, Cellulose Acetate and Nitrate emulsions and solutions for various applications.

THAT is a fair question to which we give this answer. Water is neither a standard raw material nor a standard product. It is rarely suitable for either power or processing needs without conditioning before use. The solution of all problems relating to the conditioning and use of water is the business of the Betz Consulting Division whose services include:

- **Analysis of requirements**
- **Plant design**
- **Preparation of Specifications**
- **Procurement of bids**
- **Supervision of erection**
- **Acceptance test runs**
- **Operating instruction for plant personnel**
- **Service maintenance**

Chemical engineers and others normally concerned with the problems of water requirements for power, plant and process are now confronted with extraordinary demands upon their time. The Betz Consulting Division will assume entire responsibility for this part of their work. Betz service is available for a complete plant or for any single step in design or operation.

Write for information, giving us details of your specific water problems.

WITH
HOMO-MIXER'S
ADVANCED PRINCIPLE

INDUSTRY must win the race against time! But more than a great time-saver is the Eppenbach HOMO-MIXER. It's also engineered for finer diffusion.

Its principle is wholly different. There is no vortex, no air to affect the mixture. Only a fraction of the mass is worked at one time, creating more uniform dispersion. The material is rapidly forced up from the air-free bottom by the stationary turbine fins. With tremendous pressure and turbulence, the flow surges upward, outward and down. The entire batch completes this cycle in just a minute or two. No clamping to tank, no setting at angle, no vibration.

HOMO-MIXERS are doing a big job in process plants today—batteries up to a hundred! Write us!

equilibrium with respect to the exhaust nozzle. This pressure is transmitted to the indicating, recording, or controlling meter which may be located at a remote point.

Stainless-Clad Steels Replace Sheet Brass

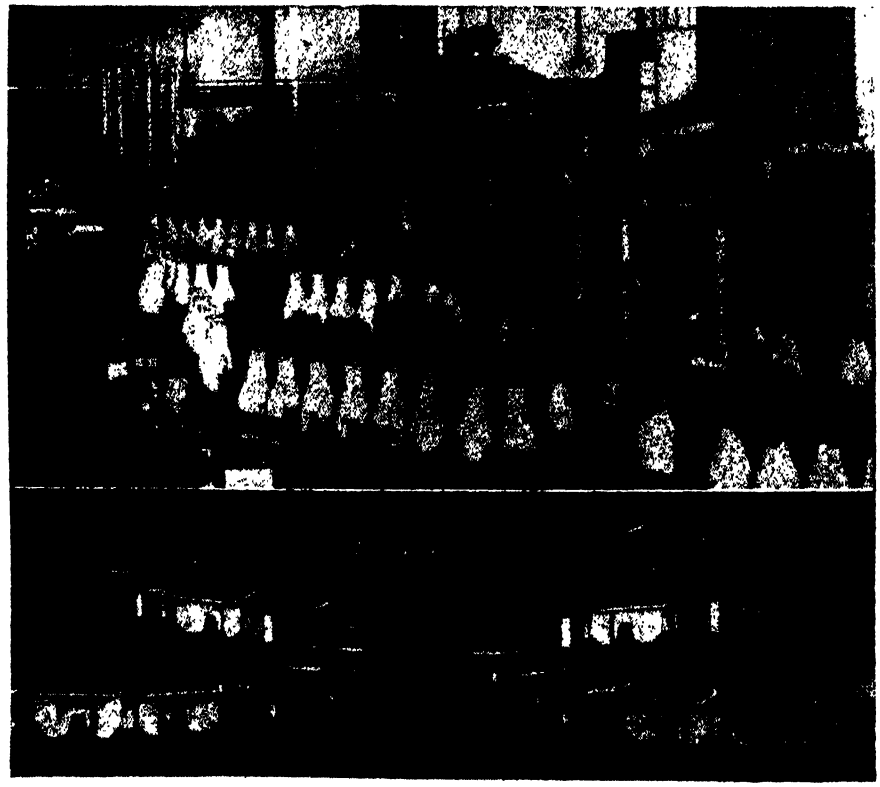
How stainless-clad steels are helping to relieve shortages in certain types of metals is illustrated by the case of the Cherry-Burrell Corp., Chicago, Ill., manufacturers of milk-handling equipment. The Cherry-Burrell Corp. developed an ingenious conveyor chain at their Little Falls, N. Y., plant. Links in this chain were made from sheet brass, but when brass was classified as a critical material the manufacturer was forced to find a suitable substitute or discontinue its manufacture.

Tests on samples of Silver-Ply stainless-clad steel, supplied by the Jessop Steel Co., Washington, Penna., convinced engineers at Cherry-Burrell that this material was the solution. Stainless-clad steel was found to possess the nontarnishing and corrosion-resisting properties of the brass sheets formerly used, while at the same time it permitted material costs to be held to a reasonable figure.

Stainless-clad steel can be used extensively during the present emergency as a substitute for solid stainless because the relatively thin layer of stainless in the clad product requires less alloy and effects the desired corrosion resistance. A 20 per cent clad sheet or plate of stainless-clad steel, for example, saves four fifths of the stainless steel required in a comparable sheet or plate of solid stainless. Continued acceptance of stainless-clad steel during peacetime is predicted by Jessop Steel because of its lower costs as compared to solid stainless steel.

Dynamite Cartridge

A new dynamite cartridge which will expand under tamping to fill the bore hole and concentrate the charge has been developed by the Explosives Department of Hercules Powder Co., Wilmington, Del. The new cartridge, called "Tamptite", eliminates the necessity of slitting cartridges, and permits concentration of a charge within the hole with little or no spillage of powder.



The dynamite is packed in a waxed paper shell having a line of perforations spiraled around the dynamite stick. The line of perforations is located between inner and outer layers of paper so that there is no direct track through which moisture might enter or ingredients leak out. When tamped in a bore hole, the cartridge does not open as a slit cartridge does, but unwraps slightly as it expands to fill the hole. Splitting along the perforated line permits the dynamite to be telescoped to a shortened length while it expands to the diameter of the hole. Even in upper holes where dynamite in slit cartridges often spills, little or no spillage occurs with the new cartridge.

All the Hercules brands and grades commonly used in mining, quarrying, contacting, and underground work in sizes up to 1.75 inches in diameter are available in the new shell.

New Type of Asphalt Tile

The development of a new type of asphalt tile designed to prevent the accumulation of static electricity has been announced by the Building Materials Division of the Armstrong Cork Co., Lancaster, Penna.

The new material, which will be known

Links in this chain, formerly of sheet brass, are made from stainless-clad steel.

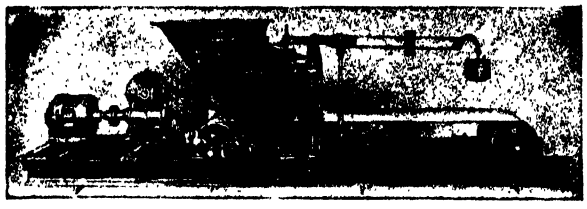
as Armstrong's conductive asphalt tile, provides a surface condition which results in less than 0.1 megohm resistance to static electricity under certain specific conditions. An additional safety feature of this flooring is that no open flames are required during installation or repair work.

Camouflage Paints

THE Truscon Laboratories, Detroit, Mich., announce a new product, Truscon camouflage coating, based on U. S. Army specifications for camouflage or visual deception for industrial areas.

The coating is put up in nine colors, plus black and white. Colors are dead flat and do not show any high lights even when viewed at sharp angles.

A new material devised by the Truscon Laboratories, given the name of VD glaze, has the useful property of immediately blotting out reflection from specular surfaces. It may be applied to glass, steel, concrete, brick, terra cotta, over paint, etc.



If applied to the outside of windows on a southern exposure, it keeps out the glare of bright sunlight where it is not wanted and reduces temperature within the work room.

Though the tints are translucent and admit daylight, when viewed from the outside the glass appears to be opaque.

Lanolin Substitute

LANOLIN for industrial purposes can in many cases be successfully replaced by Sublan, recently introduced by the Glyco Products Co., Inc., 230 King St., Brooklyn, N. Y. Sublan is made from domestic raw materials and is freely available for civilian use. In appearance it closely resembles lanolin, being a light-colored stiff paste. It has a melting point of 55° to 60° C., and a surface tack similar to that of lanolin. Sublan is insoluble in water, glycerol, and most water-soluble liquids. It is partially soluble in alcohol and vegetable oils. It is soluble in toluene and mineral spirits in the cold, and

Trichloroethylene, drums, wks., frt. allowed	lb.	.08
Tricresyl phosphate, tech., drums.	lb.	.25
Triethanolamine, drums, c/l., wks.	lb.	.19
Triphenyl phosphate, barrels	lb.	.31
Tungsten, tech., powder	lb.	2.60
Urea, dom., 46 + % N., bags, f. o. b. wks. or seaboard	ton	80.00
Vanillin, 25-lb. tins	lb.	2.35
Whiting, comm., dry-grd., bags, c/l., wks.	ton	18.00
Xylene, 10°, tanks	gal.	.30
Xylidine, drums	lb.	.35
Zinc ammonium chloride, bbls.	lb.	.0565
Chloride, tech., fused, drums	lb.	.05
Dust, bbls., c/l.	lb.	.1035
Metal slabs, at N. Y.	lb.	.0865
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.60

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

RESEARCH FELLOWSHIPS in Wood chemistry available September 1942 for M.S. candidate. Full time research and study. Stipend $50 per month for nine months. Bachelor degree in chemistry or chemical engineering required. Address applications to Dean D. S. Jeffers, University of Idaho, Moscow, Idaho

CHEMICAL ENGINEER, assistant to plant superintendent in organic chemical manufacturing, principally pharmaceuticals. Location—New Jersey. Age preferred—30 to 35 yrs., with 10 years' experience in production work. Furnish photograph, complete personal data including draft status, nationality, experience, education, and several references.
Box 42-N-3, Ind. & Eng. Chem., Easton, Pa.

PLANT CHEMIST wanted: Graduate chemist with plant experience in the manufacture of organic dyestuffs or dyestuff intermediates. Location, northern New Jersey. In first letter of application, state experience, education, marital and draft status, age, and give references.
Box 81-N-3, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMISTS, Ph.D's., with thorough training in laboratory research methods as well as in the fundamentals of organic or physical chemistry for positions as project leaders in research laboratory of major petroleum company of southwest. Recent graduates preferred. Give personal data and details as to scholastic training, salary expected, and references. Enclose recent photo. Advise if plan to attend Memphis meeting of A. C. S
Box 86-NP-3, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST wanted for bakery products control laboratory: Applicant must have college degree in chemistry and several years' experience in general food chemistry. Should have ability to supervise laboratory work and analyse flour, shortening, milk, eggs, and other products used by a bakery. Apply by written application only, giving personal and technical qualifications, experience, draft status, age, references, recent photograph, and salary desired. Application will be treated in strict confidence. The Great Atlantic and Pacific Tea Company, National Bakery Division, 420 Lexington, New York.

WANTED by CHEMICAL plant in Pennsylvania, draft exempt chemist for routine analytical and supervisory work. Please state age, training, experience, draft status, and salary expected.
Box 15-NP-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: At least ten years' diversified industrial experience. Take complete charge modern industrial research and development laboratory for small, well-known, well established manufacturer of organic chemical specialties. New York City district. Good salary and bonus. Work includes special war production problems. All replies should give full data and will be held in strict confidence. No discrimination because of race, creed or color.
Box 17-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST

to conduct investigations for well known manufacturing organization involving further development of its product for emergency use and post war expansion as well as problems relating to war contracts in process. Ph.D. or other graduate training in chemical engineering and several years' chemical research experience in electroplating or electrochemistry preferred. Send resume of experience including age, place of birth, education, earnings record and salary desired.
Box 21-NP-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST with at least 3 years' experience in plant production of fine organic chemicals. Please state past experience and qualifications in detail. Permanent position with a growing concern. Plant located near New York City.
Box 22-NP-4, Ind. & Eng. Chem., Easton, Pa.

INSTRUCTOR in CHEMISTRY. South Dakota State School of Mines. Recent Ph.D. (or Master) with major in Physical Chemistry and minor in Organic (or reverse). Give educational history, scholastic grades, experience, age and other personal data including recent photo. State minimum salary acceptable for twelve month school year starting June 1.
Box 23-N-4, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS, Chemical Engineering, University of Rochester, beginning September 1, completing M.S. program in one year. Stipend $700 plus tuition. Request further information or apply by sending complete personal data, photograph, transcript and two reference letters to Howard S. Gardner, Dept. of Engineering, University of Rochester, Rochester, New York.

CHEMICAL ENGINEERING professor desired by accredited institution. Rank and salary dependent upon qualifications. Man desired with doctorate and teaching or industrial experience but others may be considered. Give photograph, references and complete details including rank and salary expected in first letter.
Box 27-N-4, Ind. & Eng. Chem., Easton, Pa.

WANTED
RESEARCH CHEMIST

as acting head of department for old established upstate New York Manufacturing firm whose research director has been called to national service. Company normally makes soaps, cleaners, automotive chemical service materials, and is currently converting to war production as rapidly as possible. Good after-the-war possibilities for able man. Give complete account of training, experience, salary requirements and position in respect to military service. If possible enclose phot.

Box 28-NP-4, Ind. & Eng. Chem., Easton, Pa.

SENIOR CHEMISTS and Chemical Engineers are required for responsible positions in Research and Process Development by an established firm engaged in the manufacture of organic chemicals. Candidates having M.S. or Ph.D. degrees, or 3-5 years' significant experience are preferred. Please make a detailed application and include a small non-returnable photograph. Applications will be held confidential; our employees have been notified of this advertisement.
Box 50-NP-4, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST with training in Organic and Biochemistry for library position in New Jersey company. Duties include abstracting, indexing and searching of literature and patents. State courses taken, typing ability, languages, experience.
Box 49-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERS. Positions open for young M.S. or B.S. well grounded in chemistry or chemical engineering for development work with major oil company. Applicant should submit details concerning education, scholarship, experience, personal data, references, and recent photograph. State salary expected.
Box 54-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for process development, work on present and proposed plant operations. Inorganic pigment production. Plant location Virginia. Prior experience not essential. State age, experience, education, and enclose photograph if available.
Box 57-NP-4, Ind. & Eng. Chem., Easton, Pa.

COLLOID CHEMIST, Ph.D. and several years' experience in this field. Particular consideration will be given to a man with knowledge of surface chemistry. Knowledge of organic chemistry desirable. In reply give full information regarding training and experience, draft status and salary that you would consider. Mid-western location.
Box 60-NP-4, Ind. & Eng. Chem., Easton, Pa.

YOUNG PHYSICIST or engineer with detailed knowledge of applied physics wanted by Rayon manufacturer for research work. Woman, or man with deferred draft classification. Not over about 30 years of age. Give summary of education, experience, personal data, salary required. References and recent non-returnable photograph or snapshot. Location southeast.
Box 62-NP-4, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST wanted. Experienced Analyst who can handle bacteriological examination wanted for Mid-Western food concern. In replying state previous positions held, exact nature of duties performed, and salary desired.
Box 73-NP-4, Ind. & Eng. Chem., Easton, Pa.

AN EXPERIENCED petroleum chemist-engineer is wanted to carry on marketing research and development activities for a chemicals manufacturer with Eastern head offices. Sound technical training, wide industrial acquaintance, specialized knowledge of chemical additives, and ability to assist in the direction of related laboratory investigations are essential. Submit full particulars, including salary requirements, and an inexpensive photograph. Application will be treated in confidence.
Box 74-NP-4, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIP in woman's college of southern university. Work for M.S. degree. Qualifications: B.A. or B.S. with adequate training in physics and mathematics as well as in chemistry.
Box 99-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Patent work: Chemical graduate well grounded in organic chemistry, as Junior Assistant to Patent Attorney connected with reasonably large chemical manufacturer. Excellent opportunity for young man interested in learning Chemical Patent work, particularly patent searches and analyses, with a view to permanent specialization. Previous patent experience not essential but applicant must have some imagination. Deferred draft position necessary.
Box 102-NP-4, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 514)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

CHEMIST-ENGINEER is wanted to carry on marketing research and development activities in the West Coast area for a major chemical manufacturer with Eastern head offices. Applicant should have a few years' experience and fairly wide industrial acquaintance, particularly on the West Coast. Submit full particulars, including salary requirements, and an inexpensive photograph. Replies will be treated in confidence.
Box 103-NP-4, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

WOMAN Ph.D. (Physical) with eight years' successful teaching experience in General, Analytical, Organic, and Biochemistry. Desires responsible teaching or industrial position. Now teaching. Excellent references. Interviews at Memphis meeting.
Box 15-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., with some engineering training, age 35, married, Protestant, Anglo Saxon, 10 years' research experience, naval stores, terpenes, resin acids, olefin polymerisation and hydration, catalytic vapor phase oxidation. Wishes position teaching, research, development, plant operation.
Box 33-N-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST — PLANT Executive. 25 years' experience. Full responsibility for plant operation, maintenance, chemical control and pilot plant development. Experience covers wide variety of chemical processes and equipment. Developed two new products now being marketed. Expert analytical chemist. Interested in supervision of manufacture or laboratory.
Box 52-N-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Austrian Ph.D. 1933, post graduate work, 8 years' industrial experience, 2½ years in synthetic resins and waxes, emulsions, surface active agents, oils and fats. Literature research in French, Italian, German, 3 years' in U. S. A. and here employed. First citizenship papers, age 33, married, references.
Box 63-N 3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1939. Desires research position in the middle-west, in the field of synthetic organic chemistry. Resin experience. Presently employed, available within reasonable time. Draft deferred. Single.
Box 68-N-3, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1928, with ten years' experience in teaching general, inorganic, analytical chemistry. Publications. Abstractor for the encyclopedia of chemical reactions. First rate references. Age 37, single. Ex-Austrian. Employed. Available within reasonable notice. Location immaterial.
Box 69-N-3, Ind. & Eng. Chem., Easton, Pa.

ENGINEER with exceptional training and ability. Degrees in chemical and industrial engineering leading universities. Successful record in research and development on plastics, cellulose paper, lignin, extraction and engineering economics; would prefer production. Fluent French, Spanish. Single, 24, draft deferred, immediately available.
Box 11-T-3, Ind. & Eng. Chem., Easton, Pa.

KNOWN INDUSTRIAL Biologist, for many years active in the food and fermentation industries in his former research laboratories. Wishes to contact progressive concern which is interested in the development of new products and the utilization of by-products. The connection should be consultant and advisory based upon mutual understanding.
Box 12-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.I.T. graduate plus business training with twenty years' diversified experience directing (often as consultant) research and development on products, processes, equipment; cooperating in design and initial operation of million dollar plants; solving production problems; increasing morale and efficiency of men. Recently in pulp and paper; earlier in rubber chemicals, varnishes and heavy coatings, gas and by-products.
Box 34-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1940 research in Friedel-Crafts alkylation. Thesis and publications. Sigma Xi and Phi Lambda Upsilon. Research experience in petroleum chemistry, manufacture medicinal white oil and petroleum sulfonates. Employed, draft deferred.
Box 15-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Experienced in industrial research and organic synthesis. Also thorough and practical background in analytical and physical chemistry. Honor societies. Publication. Now profitably employed but seeking responsible position which offers greater opportunity for advancement.
Box 19-T-3, Ind. & Eng. Chem., Easton, Pa.

PROFESSORSHIP, by Ph.D. Ten years' teaching experience, chiefly general, some physical, organic, analytical. Five years' experience in industrial research laboratory where now employed. Age 36, married, four children, Protestant, honorary societies. South preferred.
Box 24-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.SC. in Chemistry, May 1942 prefers employment within 100 miles of Philadelphia, but will go anywhere. Scholarship student (I.Q. 150), with summer experience in control laboratory. Basically trained in inorganic, organic, analytical and physical chemistry, also in microanalysis.
Box 38-T-3, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, B.Sc. May, 1942. Standard training in main divisions of chemistry, including microanalysis and chemistry of foods and drugs. Scholarship student, college laboratory assistant, summer experience in petroleum industry.
Box 40-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, research, development. M.A. eastern university 1942. Teaching fellow. B.A. far western university 1938. Two years' experience in mid-west in synthetic resins, coatings, plastics, and related products. Persistent worker. Age 25. Selective service 2-A. Available June.
Box 58-T-3, Ind. & Eng. Chem., Easton, Pa.

THOROUGHLY TRAINED chemist. M.S. Iowa State; B.S., Ph.D. Cornell. Research: plant pigments, vitamins, bioassays, balance studies, feed and food analyses, mineral nutrition. Experience; two years' industrial, one year head of chemistry department small college. Phi Kappa Phi. 26, married. Desires teaching with opportunity for research.
Box 66-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Ph.D. Industrial experience in synthetic medicinal research, hydrogenation. Working knowledge of pharmacology. High scholastic standing, fellowships, college teaching. Patents, publications. Young, married, draft deferred. Desires pharmaceutical research position in East.
Box 67-T-3, Ind. & Eng. Chem., Easton, Pa.

NUTRITIONAL CHEMIST. Assistant Professor of Biological Chemistry in large University desires new position, either academic or industrial. Numerous research publications. Location immaterial. Available immediately.
Box 69-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Ph.D. Wide experience in theoretical and synthetic organic chemistry. Undergraduate and graduate study, academic and industrial Post-doctorate appointments, and instructorship, at large Eastern University. Phi Beta Kappa, Sigma Xi. Publications, independent research. Employed. Desires industrial or academic position.
Box 76-T-3, Ind. & Eng. Chem., Easton, Pa.

NEW PRODUCT? Could I suggest or work out with you that new product? Biochemist, Ph.D. with industrial plant and laboratory experience in vitamins and vitamin products, nutrition, foods and bioassays. Desires supervision of production or research with progressive company. Married.
Box 79-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D.; Sigma Xi; wishes part-time literature or laboratory work in New York City area; now employed; own laboratory; synthesis and analysis; prefers small active firm.
Box 82-T-3, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST CHEMIST: desires teaching or industrial connection. Five years' metallurgical and chemical college teaching experience; worked four years steel mills. Experience includes physical testing, analysis, melting, inspection. Age 34, married, now employed.
Box 10-N-4, Ind. & Eng. Chem., Easton, Pa.

PROFESSOR, PHYSICAL, inorganic, colloid, at an institution which encourages research; Ph.D., age 40, married; uninterrupted, wide experience research in above fields with some teaching; many publications and patents; administrative ability.
Box 11-N-4, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION and SALES increases constitute direct evidence of achievement in laboratory product development, factory installation, and sales engineering by head of small laboratory who desires a better opportunity. M.S., 6 years' experience.
Box 12-N-4, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist. M.S. leading University. Young, personable, responsible. Excellent organic training. Research and industrial experience. Desires organic research position in a metropolitan area, preferably New York or Chicago. Presently employed.
Box 14-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH chemist. Ph.D. 1937. Age 29. Employed, married. 5 years' industrial experience in synthetic, analytical, developmental aliphatic and aromatic chemistry. Good technician. Keen student of scientific literature. Vital defense development position sought. Salary $4500.
Box 16-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. (June), desires industrial research position. Ph.D. research on synthetic estrogenic substances. Publications, commercial fellowships. Draft deferred. Prefer location in East. Immediately available.
Box 19-N-4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST Ph.D. 1942 from large eastern university, desires industrial position. Minor organic chemistry. Four years' experience in college and university teaching. Thoroughly experienced in new physico-chemical techniques. Organic and physical publications. Age 25. Phi Beta Kappa, Sigma Xi, Phi Lambda Upsilon. Honors. Available June.
Box 25-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST and Metallurgical Engineer, D.Eng., 15 years' experience in research and control of fuels, oils, gas, water, metals, plastics, rubber. Desires research in corrosion of metals and its prevention. Prefer metropolitan area.
Box 20-N-4, Ind. & Eng. Chem., Easton, Pa.

ATTENTION — COLLEGES and Universities. Do you need chemistry instructors for your summer session? Here's one with five years' experience at a Grade A college. Ph.D. honor societies. Married. Available May 25 to Sept. 15.
Box 24-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.A. 1941, post-graduate work towards Masters (evenings). Desires position in organic chemistry with opportunity in research. Draft deferred; approximately one year experience. Location immaterial.
Box 29-N-4, Ind. & Eng. Chem., Easton, Pa.

SUPERINTENDENT or FACTORY Manager. Accustomed full responsibility. B.S., M.S., Ch.E. Plant design, pilot, layout, development, installation; operation, maintenance, production planning, costs, chemical economics, mass production, packaging, personnel and sales relations. Solvent recovery, distillation (including vacuum), oleum handling. Inorganic and synthetic chemicals, alcohols, alkaloids, plastics, solvents. Age forty, married, American ancestry, Protestant; consulting experience, patents, publications, references. Available immediately, war production preferred.
Box 30-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., 1935. Six years' industrial experience in enzyme and fermentation research. Married. Publications, Sigma Xi.
Box 33-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, M.S. in Physical Chemistry. Two years' graduate work toward Ph.D. with research in Ceramics and high temperature physical chemistry. Experience in physico-chemical measurements, refractories, electrode-potentials, use of petrographic microscope, X-ray, spectroscope. Excellent record, references. Favorable draft status.
Box 35-N-4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, M.S. Wide experience in analytical chemistry. Research in Agri. Ex. Sta. Major fields biochemistry and organic. Age 26, married.
Box 36-N-4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL ORGANIC Ph.D. 1935. Seven years' industrial and development research. Specialist in catalytic processes. Married and draft-deferred. Now employed. Desire academic opportunity or chance to apply knowledge in new industrial fields.
Box 37-N-4, Ind. & Eng. Chem., Easton, Pa.

LIBRARY CHEMIST, now so employed, several degrees, honors, seeks new connection. Experience in searches, translations, library organization, research. Interested in patents. German, French perfect. Several other languages. Young, efficient personality. Location immaterial.
Box 38-N-4, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST thoroughly trained in bacteriology and physical chemistry desires new connection. Now director of laboratories for a large concern manufacturing dairy products. Broad experience in laboratory control, sanitation, research and process development. Good personality. Executive ability. Publications in both food chemistry and bacteriology.
Box 39-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. with work toward doctorate desires research and development, able to organise and direct research; experience in: organic synthesis, literature search, patents, dyestuffs, inks, paints. Age 29, class 3A, employed, location south or midwest.
Box 40-N-4, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING. Ph.D. in June, midwestern university. Organic major, physics minor. Three years' experience teaching general, analytical and organic chemistry in junior college. Several years industrial experience. Married. Protestant. Age 32. Alpha Chi Sigma.
Box 41-N-4, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, 1940. Experienced in pilot plant operation. Wide knowledge of plastics including molding technique, plastic formulations, selection of molding compounds and production. New England location preferred.
Box 43-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. in Chemical Engineering, Columbia. Research experience: industrial synthetic intermediates, electrochemistry, vitamin extraction. Age 33, married. Member Phi Lambda Upsilon, Sigma Xi. Permanently employed, head college chemistry department. Available for summer months only.
Box 45-N-4, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 515)

(Situations Wanted Continued)

SYNTHETIC ORGANIC Chemist. 3 years' in academic research and over 4 years' in industrial research and development. B.S. Chemical Engineering, M.S. Chemistry. Now employed but wishes to change to position of more responsibility where abilities can be more fully utilised. A metropolitan area is preferable.
Box 46-N-4, Ind. & Eng. Chem., Easton, Pa.

DRUG RESEARCH and development. Ph.D. organic chemistry, registered pharmacist. 15 years' experience in all phases of industrial pharmaceutical research and manufacturing. Write leading ethical firms. Experienced Food & Drug rules. Many publications and patents. Produced several outstanding new synthetic and biological medicinals. Interested in executive position only.
Box 42-N 4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST-Chemical Engineer, Ph.D. Organic and Chemical Engineering, August 1942; B.S. 1939; M.A. in organic and analytical, 1940; Ph.D. course work complete in May. Research on Phenanthridine in progress. Excellent background in thermodynamics, theory of plastics, and organic synthesis. Possesses initiative, ambition, and ability to work with people. Want responsible position in industrial development or university teaching. Unmarried, good health, honor societies. Draft classification 2-A. Age 23. Available September 1942.
Box 47-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.A. in chemistry 1941. Will complete year of graduate work in June. Prefer organic position; rubber or plastics. Graduate studies and research in rubber chemistry at University of Akron. Single. Eastern location preferred.
Box 48-N-4, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT CHEMIST, M.S. Five years' successful experience developing photoengraving specialties. Can formulate surface coatings, metal sensitizers, acid resists, silver emulsions, and photographic chemicals. Age 32, married. Now employed.
Box 51-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST (organic and plastic) Ph.D. experienced in manufacture organic chemicals and molding powder from synthetic resins, pressing commercially available plastics, especially molding metal powder with synthetic resin. Have shown originality and obtained practical results. Married, 45, available immediately because restrictions on manufacture.
Box 53-N-4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, B.S. Chemical Engineering. Some graduate work completed. Experience in pulp and paper manufacture and control, clay and ceramic analysis, prefer inorganic, minerals, or control chemistry. Married, 24, draft deferred. Available for interview at Memphis meeting.
Box 55-N-4, Ind. & Eng. Chem., Easton, Pa.

SUMMER TEACHING position desired by assistant professor at accredited eastern college. Ph.D. 34 years' old. Will teach general, analytical or physical chemistry. Eastern location. Will consider permanent position with opportunity for advancement.
Box 58-N-4, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION in general, analytical or physical chemistry. 8 years' enjoyable teaching experience in liberal arts college and large university. Publications in educational analytical, and physical chemistry. Ph.D. degree. Employed. Family.
Box 59-N-4, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM TECHNOLOGIST, M.S., broad experience in supervising oil refining operations, manufacture of petroleum specialties and related operations; law graduate; extensive patent experience, also sales research and development; desire technical management work in petroleum or related chemical industry.
Box 63-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., with good background in organic and physical chemistry. Teaching and industrial experience. Three years' research in vitamins with publications. Now employed. Age 29, married. Research or teaching position desired in East. Available on short notice.
Box 65-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Available June 1. Graduate research with organometallics at leading midwest university. 3 years' teaching experience, desires to go into organic research in industry. Some experience with dyes, organic syntheses. Single, 23, Protestant, draft 2-A. Location immaterial. Now located in Iowa.
Box 66-N-4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. Ph.D. 1935, Midwestern University. Now employed. Desires change in position where opportunities in teaching and research are available. Six years' teaching experience in analytical, organic, general and physical chemistry. Chemical microscopy and X-ray crystallography are possible fields. Age 37, family.
Box 68-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, AGRICULTURAL, M.S. Age 32. Major—soil, plant and analytical chemistry. Seven years' experience. Also interested in fertilizer work. Location immaterial. Now employed. Protestant. Draft 3A. Available 30 days.
Box 70-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Chemist M.Ch.E., A.C.S. approved university, 27, single, 3-A draft, courses in analytical, organic, inorganic dyes and intermediates, physics, technology, engineering. E.S.M.D.T. course fuels and lubricants. Desire lab. or plant assistant, junior chemist position with chance for advancement. Preferably N.Y.C. or vicinity but consider anywhere. Available on short notice.
Box 64-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and DEVELOPMENT Chemical Engineer. Last five years' experience development and control fused magnesium oxide for calrod electrical heating industry, previous four in general analytical chemistry and special methods development. B.S. Ch.E. Purdue 1932. Graduate physical chemistry Union College. Age 35, married, three children.
Box 67-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1942 (June). Vitamins and nutrition Good foundation in organic and physical chemistry and physiology. Research on vitamin B complex and protein requirements. Publications. Five years' teaching biochemistry, general and physical chemistry. Desires research or teaching.
Box 69-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH or PRODUCTION executive. 13 years' experience in industrial research, chemical engineering development and production supervision. B.S. in chemical engineering. Ph.D. in physical chemistry. Now employed in executive capacity by large corporation. Desire broader opportunity to apply demonstrated ability in development and operation of chemical engineering processes and equipment.
Box 71-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC PH.D. Nine years' experience in research and development of synthetic medicinals, pharmaceutical specialties, food products and processes, control methods. Capable analyst, working knowledge of bacteriology, physiological chemistry, and pertinent medical sciences. Experience in arranging clinical trials of new medicinals. Understands commercial aspects of research work. Thorough knowledge of Food and Drug Laws. Administrative ability. Laboratory facilities available if desired. Publications. Employed. Married.
Box 72-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., June 1942 from large Eastern University, desires research position in medicinals, plastics or natural products. Thorough training in Organic, Physical, Colloids, and Bacteriology. Five years' teaching experience in technical school. Research experience in organic synthesis, nitrogen heterocycles, medicinals. Protestant, age 28, married. Attending Memphis meeting.
Box 75-N-4, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST & Chemical Engineer; extensive experience production, research, development, control work, specification writing. Employed by Government and Industrial companies. Experience in food, fuel and building materials industries. Good references, employed, available on short notice.
Box 76-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., desires research position. Research experience in organic synthesis, analysis, production of sterols, aminoacids, synthesis of phenols. Familiar with organic micro-technique, pH control, spectrophotometry, micro-biological methods. Draft deferred, dependency.
Box 78-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, ORGANIC, Ph.D. in 1942 from Eastern university. Available June 1. Desires position in research or development. Research on mechanism of organic reactions and organic synthesis. Publications. Well grounded in physical and analytical. 4 years' experience in teaching organic and inorganic. Age 26, single. 2A in draft. Sigma Xi. Will attend Memphis meeting.
Box 79-N-4, Ind. & Eng. Chem., Easton, Pa.

ACADEMIC POSITION in Biochemistry or Bacteriology desired by Ph.D. 1940, with two years' post-doctorate experience in vitamin and enzyme research. Publications. Sigma Xi. Married, Class 3. Currently employed, but desirous of position with opportunity for teaching. Available August 1942 or sooner if necessary. Attending meetings at Memphis.
Box 82-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, Bacteriologist. A.B., 16 years' experience in foods, biological and bacteriological products, plant management including production, maintenance, personnel, and accounting. Successful research and sales records. Patent experience. Age 39, married, Protestant. Continental U. S. preferred.
Box 83-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. Univ. of Penna. 1934. Experienced in supervision of production, handling union labor. Four years' experience fermentation, distillation of alcoholic beverages. Three years' experience soap, inedible oils, crude glycerine. Minor experience heavy chemicals, petroleum refining. Seeks position as superintendent of production operations. Salary proportionate to responsibility. Available on reasonable notice. Metropolitan location in North or East preferred but not essential. Native American, Protestant, age 30, married, draft status 3-A.
Box 87-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D. Age 35. Several years' experience process equipment design, pilot plant development, pilot plant layout. Familiar with organic and physical chemistry. Not an abstract theorist. Desire permanent position as development director or group leader. $5000. Draft deferred.
Box 88-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and INDUSTRIAL Chemist, Ph.D. in physical. Thoroughly trained and capable of organizing and directing research. Several years' industrial experience in high polymer chemistry, synthetic fibers, viscose rayon and nitrocellulose. Generally familiar and experienced with colloids, emulsions, surface chemistry, synthesis, literature and economic surveys and patents. Married, 33, Protestant. Draft deferred. Employed, available on reasonable notice. Desire broader opportunity in research, development or production.
Box 89-N-4, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION, College or University, for Ph.D. Successful experience in teaching Biochemistry. Organic and Inorganic. Married. Protestant. Now teaching but desire a position with greater future. Primary interest is teaching.
Box 92-N-4, Ind. & Eng. Chem., Easton, Pa.

CELLULOSE CHEMIST, M.S., 1937, age 34. Eight years' research and analysis cellulose and derivatives, production economy, analytical methods, detergents, water, plastics. Good scholastic and production record. Married. Attending Memphis meeting.
Box 93-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in Chemistry, Massachusetts Institute of Technology graduate. Two and half years' experience in textiles, some experience in dyestuffs. At present employed in industry vital to national defense but wish to change to research or development work. Necessary for position to be connected with national defense in order to be allowed to transfer. U. S. Citizen, unmarried, will go anywhere but prefer Northeastern or Middle-Eastern United States.
Box 94-N-4, Ind. & Eng. Chem., Easton, Pa.

INORGANIC CHEMIST. Ph.D. (1939). Seventeen years' University teaching experience. Honor societies. Publications. Age 40. Married. Employed but desires change.
Box 96-N-4, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED WOMAN vitamin and biochemist. B.S. & M.S. degrees. 2½ years' research experience in high potency yeast concentrates and fluorometric assaying of thiamin and riboflavin. Interested in research.
Box 100-N-4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A., 1942, large Eastern university. Physical chemists major; inorganic minor. Selective service classification, 4F; age 31, single, Phi Beta Kappa.
Box 106-N-4, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER, young, B.Ch.E. cum laude; M.S.Ch.E.; experience all phases petroleum refining and research and development; asphalts, road oils, fuel oils. Graduate research product development & agricultural by-product. Will consider any chemical engineering industry. Location immaterial. 1B classification.
Box 52-T-3, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST—CHEMIST. Graduate of large middlewestern college, with two years' of graduate work. Three years' of experience in industrial fermentations of EtoH; BuoH, acetone and EtoH. Have complete knowledge of most commercial fermentations, including chemical analysis. Both plant and laboratory experience.
Box 56-N-4, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE with broad experience in sales, development, export, financing, office management, purchasing, negotiating contracts. Desires to enter chemical field. Business degree. Native citizen, 43, married. Protestant. Speaks French and Dutch. References. Connection with progressive company manufacturing or distributing war products essential but one with good peacetime prospects.
Box 77-N-4, Ind. & Eng. Chem., Easton, Pa.

GRADUATE CHEMIST, female, age 33, languages, knowledge medical and engineering phraseology, with diversified business experience and solid scientific background, seeks active type of work. Combination of research with laboratory or business routine acceptable. Not interested in stenographic or straight literary research work.
Box 81-N-4, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED Ph.D. desires position as group research leader on project requiring thorough knowledge of organic and pharmaceutical chemistry. Capable of carrying suitable project into manufacturing stage.
Box 91-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. Organic and biochemical research, synthesis and analysis. Experience in foods, beverages, oils, pharmaceuticals, proteins, carbohydrates and blood chemistry. Knowledge of German, Russian and French. Married. Citizen, deferred. Good references.
Box 97-N-4, Ind. & Eng. Chem., Easton, Pa.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

INDEX MEDIA for Chemical Microscopists and Petrographers. Supplied to leading institutions throughout the world for many years. Research Set, Nd 1.41–1.78, steps .01, in applicator bottles with leatherette case $31.50. Everything practicable in liquid and solid media. J. T. Rooney, Box 358, Buffalo, N. Y.

NATIONAL MANUFACTURING and selling organization doing several million dollars annually, now catering to department and chain stores, is interested in acquiring patents and processes of products that do not require drastic equipment changes. Entirely open-minded, but especially interested in emulsions or dispersions as substitutes for rubber and/or latex and suitable for dipping on forms.
Box 44-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOLOGICAL ASSAYS of vitamins and hormones, some microbiological and chemical assays and related research projects. Prices moderate for the high level of precision and the limited amount of work that is undertaken at one time.
Box 98-N-4, Ind. & Eng. Chem., Easton, Pa.

ABBE TYPE Refractometer standard Bausch and Lomb, practically new, for sale $250 range 13,000 to 17,000. Heatable prisms, thermometer, case, standard test plate dispersion compensator and measuring scale. See Eimer and Amend No. 30400. Immediate delivery.
Box 18-N-4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal, abstracts, decennial indexes, English Chemical Society. 1890–1940 inclusive. Bound 1890–1921 (105 volumes). Unbound 1922–1940. As new $240. Delivered purchase's address; carriage, insurance, paid to quayside New York. Dr. Henstock, Theta, Exmouth, England.

WE OFFER: 10 kilos Indium Chloride, 5000 pounds Cerium chloride, 1000 pounds Sodium uranate, 1000 pounds Titanium carbide, 500 pounds Iron carbonyl, 2000 pounds Columbite, 500 pounds Samarskite, 150 tons Black Oxide Iron, 5000 tons Volcanic ash.
Box 80-N-4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Laboratory apparatus, Hanovia Quarts Ultra Violet lamps, B & L Colorimeters, Dubosq microscopes, Gaertner Spectrophotometer, Schmidt Haensch Polarimeter, Gaertner Cathetometer, L & N Potentiometer, Galvanometer, Eppley Standard Cells, Analytical Balances, Barnstead Water Stills, Edwards Gas Density Balance, International Centrifuges, Size 1, type SB, Horizontal Autoclaves, Laboratory Hydraulic 6 x 6 presses, Muffle Furnaces, Pyrometer, Drying ovens, Incubators, Water Baths, Beckmann Thermometers, etc. Write us your needs we cheerfully quote on all inquiries. The Laboratory Exchange, 24 E. 21st Street, N. Y. C.

FOR SALE: 50 laboratory balances, pulp, for general laboratory routine, 100 gr Capacity, in polished mahogany case with drawer, Counterpoised sliding door, sensitivity 1 mg. (Unused). We have obtained a quantity of these and are selling them very rapidly at $27.50. We suggest ordering promptly to assure delivery. The Laboratory Exchange, 24 E. 21st Street, N. Y. C.

FOR SALE: "American Chemical Society, Journal": Vols. 1–61 (1879–1939) bound (will not break set); "Chemisches Zentralblatt": 1890–1912, 1916–1923, 1928–1932; "Journal of Biological Chemistry": complete set, bound. A. Calvert, 221 Seaman Ave., New York, N. Y.

FOR SALE: Journal Society Chemical Industry years 1903 to 1935. Beilstein organische Chemie 3 edition, complete. Annalen Physik 1894 to 1904 Journal American Chemical Society 1914 to 1941. Friedlaender, Teerfarbenfabrikation 1 to 12.
Box 95 N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: Small quarts spectrograph (Hilger model 484 or similar) with sector photometer and accessories for ultraviolet spectrophotometry.
Box 31-N-4, Ind. & Eng. Chem., Easton, Pa.

WANTED: Liebigs Annalen der Chemie, vols. 1–524; Kolloid Zeitschrift, vols. 33–81; Kolloidbeihefte, vols. 25–48; Helvetica Chimica Acta, vols. 1–21; Textile Institute Journal and Transactions, vols. 1–15; Georgia School of Technology Library, Atlanta, Georgia.

WANTED

SALICIN

DAVID F. BIRCH

420 Lexington Ave., New York, N. Y.

LE. 2-3324

WANTED to BUY: We are very much in need of all laboratory equipment such as Polarimeters, Refractometers, Microscopes, Spectroscopes, Micrometer Microscopes and measuring instruments. We are able to offer very high prices for equipment in fine condition for prompt purchase. Offers immediately made. Send us your list of surplus apparatus. The Laboratory Exchange, 24 E. 21st Street, N. Y. C.

WANTED IMMEDIATELY, new or second-hand "High Frequency Ceramics" Albers-Schonberg.
Box 101-N-4, Ind. & Eng. Chem., Easton, Pa.

WANTED: desire to contact plant, Eastern States, for treating absorbent material, 22" wide, water solution, subsequent drying between steam rolls. Priority. II., P. O. Box 24, Station "O," New York.

WANTED: Mellor—Comprehensive Treatise on Inorganic and Theoretical Chemistry, Vols. 8–16 incl.; Journal American Chemical Society, Vols. 1–13, Incl. Wish to sell Journal American Chemical Society, Vols. 25, 50, 54, 55. Quote any volumes.
Box 107-N-4, Ind. & Eng. Chem., Easton, Pa.

soluble in mineral oil when heated. Mineral oil solutions form soft gels on cooling.

Because of its water insolubility, Sublan is suggested as a seal in lines carrying water and water-soluble liquids. It is also suggested as a protective coating for metals and as a grease and lubricant in most cases where lanolin is being used for industrial purposes.

Foundry Heating and Ventilating System

A NEW solution to the old foundry problem of free dust and sand settling into molds and causing casting rejects has been found by the American Magnesium Corp., Cleveland, Ohio, in a new heating and ventilating system. Regulation of amount, direction, and rate of air delivered prevents dusts from being blown about and dilutes the unpleasant smoke-laden atmosphere.

The equipment consists of 10 Thermadjust heat diffusers, manufactured by Carrier Corp., Syracuse, N. Y., supplying 135,000 cubic feet of outside air per minute to the foundry. Mounted in an inverted position along the side walls, the heating units are 9 feet above floor level. From long slotted outlets, a low-velocity flow of outside air is fanned downward and toward the center of the floor at the correct temperature to offset heat losses through the ventilators. Overblows, which swirl dust and other impurities around the foundry without forcing them toward the ventilators, are said to be eliminated by discharging the air at low velocity.

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

Industrial Development of Synthetic Vitamins[1]

RANDOLPH T. MAJOR Merck & Co., Inc., Rahway, N. J.

MUCH is written, both scientific and unscientific, in the papers and magazines of this country today about vitamins. In spite of this it might be well to define the word "vitamin" first. In the large unabridged dictionary in the writer's home, on the page where the word "vitamin" should be, may be found such words as "visitatorial", "vitaceae", "vitellarian", "vitelin", and "vitex"—but no word "vitamin". Later it was found listed in a separate place among new words. The front page of the dictionary shows that it was published in 1930. This observation gives some concept of the speed with which vitamins have become common knowledge.

As recently as two years ago, some people did not know the nature of vitamins. The purchasing agent of a large company which has a fine scientific laboratory visited us at that time. The discussion turned to vitamins. He said, "I am interested in vitamins, but I suppose no one has ever actually seen and handled a vitamin. Vitamins are something like electricity, aren't they?" He was taken into one of the laboratories and shown a bottle full of crystalline vitamin B_1. He was amazed.

For the purpose of this discussion vitamins might be defined as organic substances normally present in minute quantities in certain foodstuffs, the absence of which in the diet leads to well-defined morbid states.

The older so-called natural vitamins, vitamins A and D, will be mentioned very briefly. As you know, vitamins A and D, found in fish liver oils, are used in the treatment of rickets, especially in children and in the winter, for the development of proper teeth, for the treatment of night-blindness, and for building up resistance to infection. Tablets and capsules of concentrates of these vitamins in irradiated foods are available today. These vitamins have not been synthesized as yet, at least on a commercial scale. Certain individuals have claimed that they have synthesized concentrates of these vitamins, but they are not available generally.

Vitamin C or ascorbic acid was the first synthetic vitamin to be introduced commercially. It is used in the treatment and prevention of scurvy, some types of dental caries, and other disorders. It is available on the market in various pharmaceutical forms, and is put into beverages, confectionery, and certain special foods.

When interest was aroused in vitamin C a number of years ago, a little synthetic vitamin C was shown to a leading biochemist in an eastern university and he was asked, "What good do you think this will have?" His remarks, based upon his work in biochemistry over a good many years were as follows: "I think that it will find a place on the museum shelves of a number of universities, particularly of the biochemical departments. I think a few biochemists and a few pharmacologists will be interested in examining it. I do not think there will be any business in it. There is plenty of vitamin C available naturally in fruits, particularly in citrus fruits."

In contrast to this the United States Tariff Commission reports that in 1940 17 tons of vitamin C were produced synthetically in this country. From a reliable source comes the information that very shortly there will be 80 to 100 tons of vitamin C synthesized in this country annually.

In Figure 1 is shown what happened to the price of vitamin C from the time natural ascorbic acid became commercially available in 1934 at something like $213 per ounce to the present when synthetic ascorbic acid may be had for $1.65 an ounce. Figure 1 also shows the tremendous drop in price when synthetic vitamin C first became available in 1937.

Vitamin B_1 or thiamine is used in the prevention and treatment of beriberi, of lack of appetite in children, and of neuritis of various types. It is available in the various pharmaceutical forms, as well as in medicinal foods. Moreover, a new use for vitamin B_1 has developed which was not anticipated until recently. It is used in the enrichment of flour of which it is reliably stated that 40 per cent of the flour used in our homes and 35 per cent of

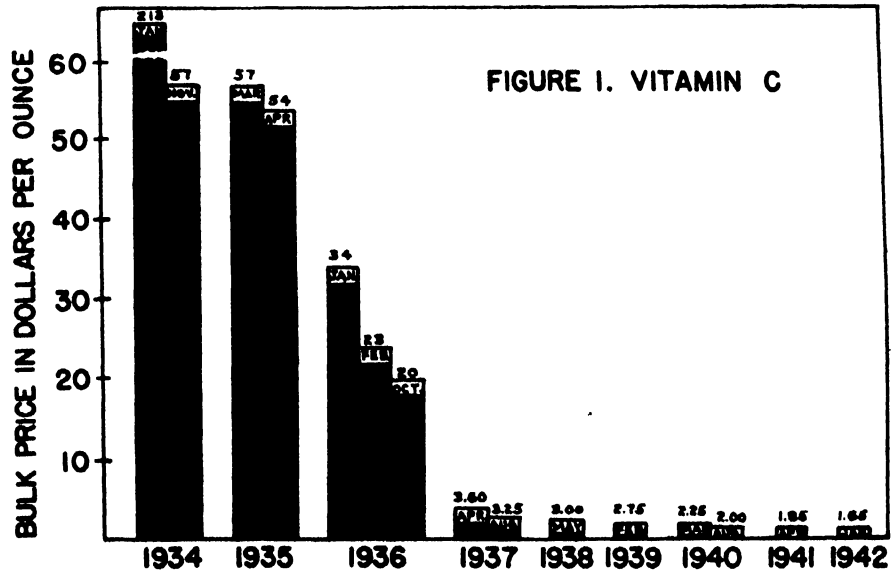

FIGURE 1. VITAMIN C

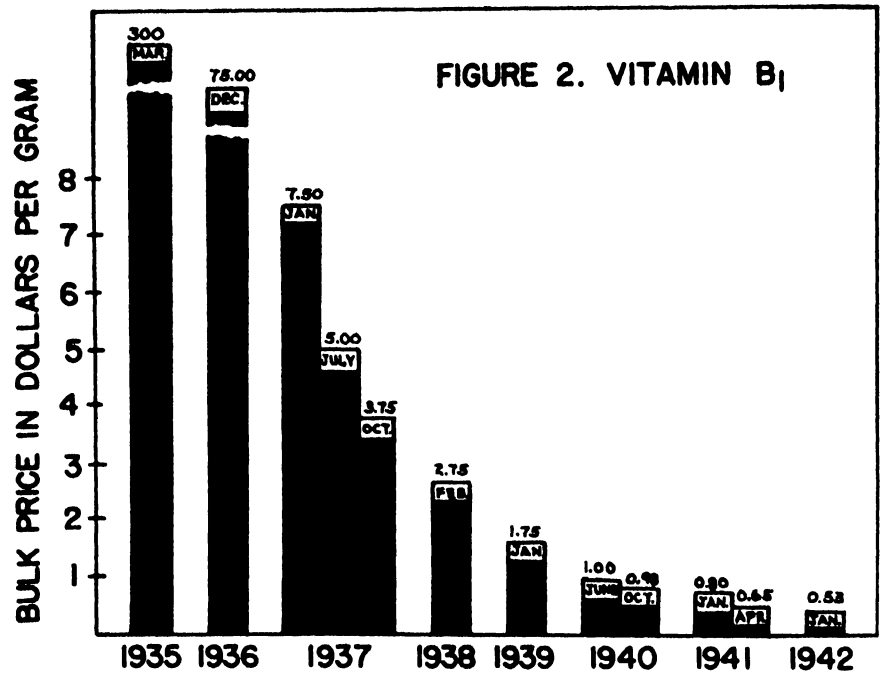


[1] Presented at a meeting of the American Section of the Society of Chemical Industry, March 27, 1942.

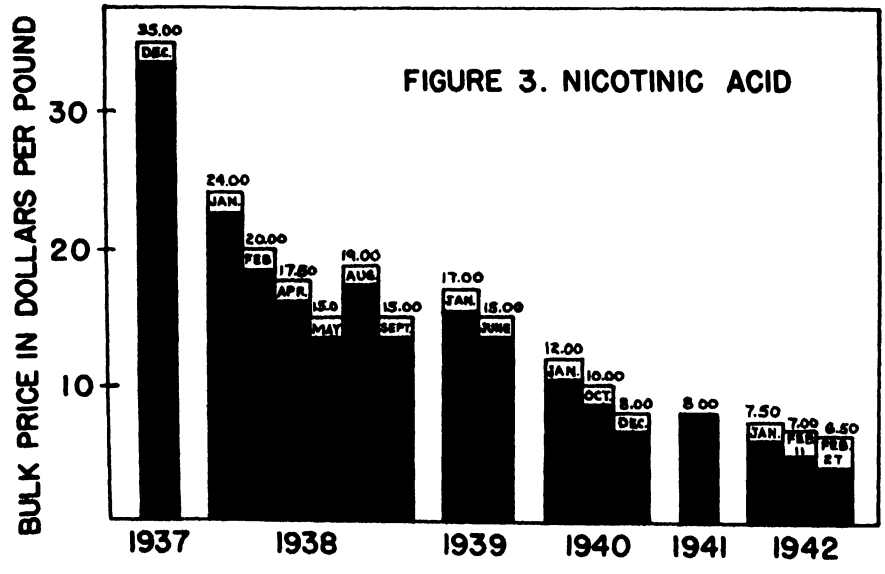
the bakery flour used in this country is being enriched with vitamin B_1 today. Each pound of that flour must contain not less than 1.66 mg. of vitamin B_1.

Vitamin B_1 was not introduced into flour without encountering difficulties. One such difficulty is illustrated by the case of one of our good Jewish friends. When he heard that synthetic vitamin B_1 was being put in bread, he was greatly worried and inquired whether Jewish people might eat this bread. In other words, was it "kosher". Fortunately for the enrichment program and also for our Jewish friends, it was determined to be kosher.

Carolina has recently passed a law that requires the enrichment of all white flour used in the state.

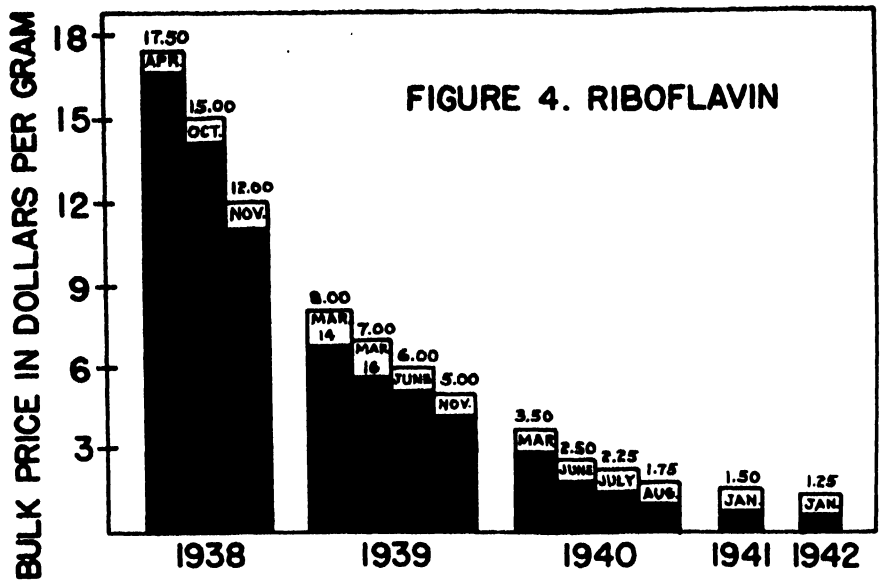
Vitamin B_1 became available only in very recent years. Figure 2 illustrates the remarkable decrease in price that has occurred as the use of vitamin B_1 has grown. In 1935 when natural vitamin B_1 became available, it cost about $300 per gram. In 1937 when the synthetic vitamin was first sold, the price dropped to $7.50. The drop has continued until it is now being sold for $0.53 per gram. It is reliably stated vitamin B_1 will soon be made in this country at the rate of 25 to 30 tons annually.

Another commercially important vitamin is nicotinic acid, or niacin, as it is called for the benefit of those who object to consuming nicotinic acid because they associate the name with nicotine. It is used in the cure and prevention of pellagra and is available on the market in various pharmaceutical forms, sometimes in combination with other vitamins and sometimes alone. It is available in medicinal foods and is added to all the enriched flour previously mentioned, in connection with vitamin B_1. Each pound of enriched flour must contain not less than 6 mg. of niacin.

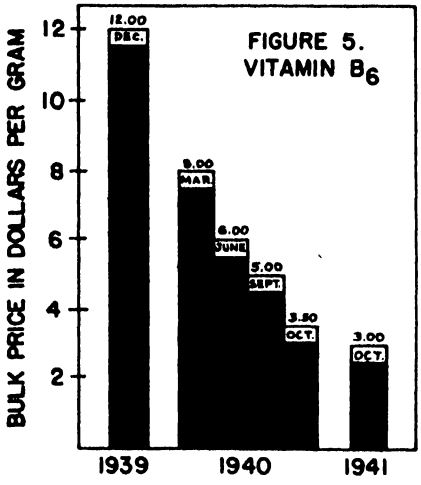


The trend of the price of nicotinic acid since 1937 is shown in Figure 3. The price of nicotinic acid in bulk has dropped from $35 per pound in 1937 to $6.50 per pound in February 1942. The decrease in price has not been so marked as in the case of some of the other vitamins, since nicotinic acid is an old, well-known compound. It is interesting, however, that increasing volume of production along with chemical and engineering studies has made it possible to decrease the price to the figure indicated, especially in times of generally rising prices.

Riboflavin (vitamin B_2) is used in the treatment of certain fissures of the lips and keratitis, a certain type of inflammation of the eyes, and also in the poultry industry to stimulate egg production. It is available in pharmaceutical preparations and in medicinal foods. Beginning July 1, 1942, it will be required in enriched flour if sufficient riboflavin is available then to enrich the enormous quantity of flour needed in this country. This requirement may have to be deferred for a few months because of a shortage of riboflavin



Some may wonder why an effort is being made to enrich white flour rather than to encourage more widespread use of whole wheat flour. That is too long a story to discuss here, but the following quotation from Oscar Wilde's "De Profundis" may prove interesting. In describing a man who had been in jail for some time, he wrote:



Some six weeks ago I was allowed by the doctor to have white bread to eat instead of the coarse black or brown bread of ordinary prison fare. It is a great delicacy. It will sound strange that dry bread could possibly be a delicacy to anyone. To me it is so much so that at the close of each meal I carefully eat whatever crumbs may be left on my tin plate.

The Army and Navy have specified that the bread baked for the soldiers and sailors must all be enriched. South

A.

owing to the difficulties that have been encountered in obtaining equipment necessary for its manufacture in sufficient quantity. For the enrichment of flour 1.2 mg. of riboflavin are required per pound of flour. The interest in riboflavin has also grown rapidly. In Figure 4 is presented the history of the bulk price of riboflavin, beginning in 1938 when synthetic riboflavin in bulk first became available at $13.50 per gram to the present time when it may be had for $1.25 per gram. This picture is not so striking as in the cases of vitamin C and vitamin B_1 since riboflavin has not yet been produced in as large quantities. Undoubtedly, however, the price of riboflavin will be lowered as production increases.

All of the vitamins discussed in the preceding paragraphs have very definite, well-defined uses. The value of the next two vitamins to be discussed is not so well known. There are indications that the first of these, vitamin B_6, may be of value in the treatment of certain muscular rigidities, in paralysis agitans, and perhaps for other conditions. In spite of this, however, there is considerable interest in this vitamin, the synthesis of which was first reported in 1939. Figure 5 presents the effect of increased production on its price since 1939.

As is the case with vitamin B_6, the biological and medical value of the next vitamin, calcium pantothenate, is poorly defined. However, everywhere one goes the value of pantothenic acid in the cure and prevention of white or gray hair is discussed.

In Figure 6 is shown a black rat whose fur has turned gray owing to a deficiency of pantothenic acid in its diet. Administration of pantothenic acid would change this fur back to its natural color. The Good Housekeeping Institute has published a statement that it is possible to change a human being's gray hair back to normal by the use of pantothenic acid. On the West Coast calcium pantothenate is being added to a large proportion of the milk sold. Pantothenic acid in the form of its calcium salt is available in various pharmaceutical forms. In Figure 7 is presented the change in price of calcium pantothenate that has occurred with increasing use. Note that it was first made available just two years ago—in 1940.

Figure 6

There are a number of other vitamins that may be termed parts of the vitamin B complex. Among them are inositol which Dr. Woolley, of the Rockefeller Institute, observed has certain effects on the hair of mice, *p*-aminobenzoic acid which was proposed as a vitamin by another New Yorker, choline, and biotin. There are others, but they appear to be of still less importance, at least at this time.

Two fat-soluble vitamins have been synthesized. One of these, vitamin K, is generally used in two forms—first as vitamin K_1, and second as 2-methylnaphthoquinone. Both of these compounds decrease the clotting time of the blood and are used in patients before operations, particularly in people suffering from jaundice, and also at childbirth.

The other synthetic fat-soluble vitamin, vitamin E, or α-tocopherol, is essential for proper reproduction in rats, but its value in humans is quite uncertain. It may be of value in the correction of human sterility; and it may be important in the treatment of certain neuromuscular disorders.

Development of Our Knowledge of Synthetic Vitamins

Scurvy, a disease caused by lack of vitamin C, has been recognized for many, many years. It was a scourge to those who traveled long distances by boat until quite modern times. Many sailors and passengers on long voyages before the 19th century died of this disease before they reached their journey's end. But in 1804 the regular issue of a ration of lemon juice was made compulsory in the British Navy and thereafter scurvy was a comparatively rare disease among British sailors. However, before vitamin C was isolated, the whole concept of some diseases being due to the lack of certain so-called accessory factors had to be recognized by scientists and much experimental work on animals performed. It was found that the guinea pig suffered from scurvy and was a suitable experimental animal for these studies. Using this animal as an indicator of activity it was possible by various methods of fractionation and separation to isolate crystalline vitamin C.

Vitamin C was isolated and first recognized as a vitamin by two American biochemists, Waugh and King, in 1932. After they had isolated vitamin C, using the

guinea pig as an indicator of the activity of their fractions, it was found that the same material had been isolated from adrenal glands previously by a Hungarian, Szent-Györgyi, in 1928. However, Szent-Györgyi had not recognized that he had had vitamin C in his hands. Subsequent to the successful isolation of vitamin C, chemists became interested in its structure and synthesis. In 1933 chemists in various parts of the world had synthesized vitamin C after the structure had first been determined. One of these early syntheses is due to Reichstein, in which xylosone is converted to a nitril, hydrolyzed to the 2-keto sugar acid, and finally converted to ascorbic acid. This did not prove a very satisfactory commercial synthesis, because it started with xylose or lyxose, both of which are not readily available. A more successful synthesis also due to Reichstein used the readily available sugar, glucose, as raw material. Glucose was hydrogenated to sorbitol, converted to sorbose, then to diacetone sorbose, and then oxidized to 2-keto-*l*-gulonic acid which was converted into vitamin C. Among the other scientists who did considerable work on the synthesis of this vitamin are Karrer, Haworth, von Euler, and Micheel.

The first manufacture of natural vitamin C in this country took place in 1934. It was made from gladiolus leaves, which had been found to contain a relatively high per cent of vitamin C. Fields of gladioli were planted in the vicinity of the author's company's factory. Many difficulties were encountered in collecting and extracting the plants on the day that they were cut.

Synthetic ascorbic acid was first made available in the United States in 1937.

Beriberi, the disease caused by the lack of vitamin B_1, was also recognized many years ago. Because so many people in the Orient have suffered from this disease, the attention of medical scientists was attracted to it at an early date. Most of the early work was carried on in the Orient. Takaki, the director-general of the Japanese Navy Medical Service, was able to banish beriberi from the Japanese Navy in 1882 by increasing the allowance of vegetables, fish, and meat in the navy diet and by using barley instead of polished rice. He recognized that beriberi was caused by

Figure 8

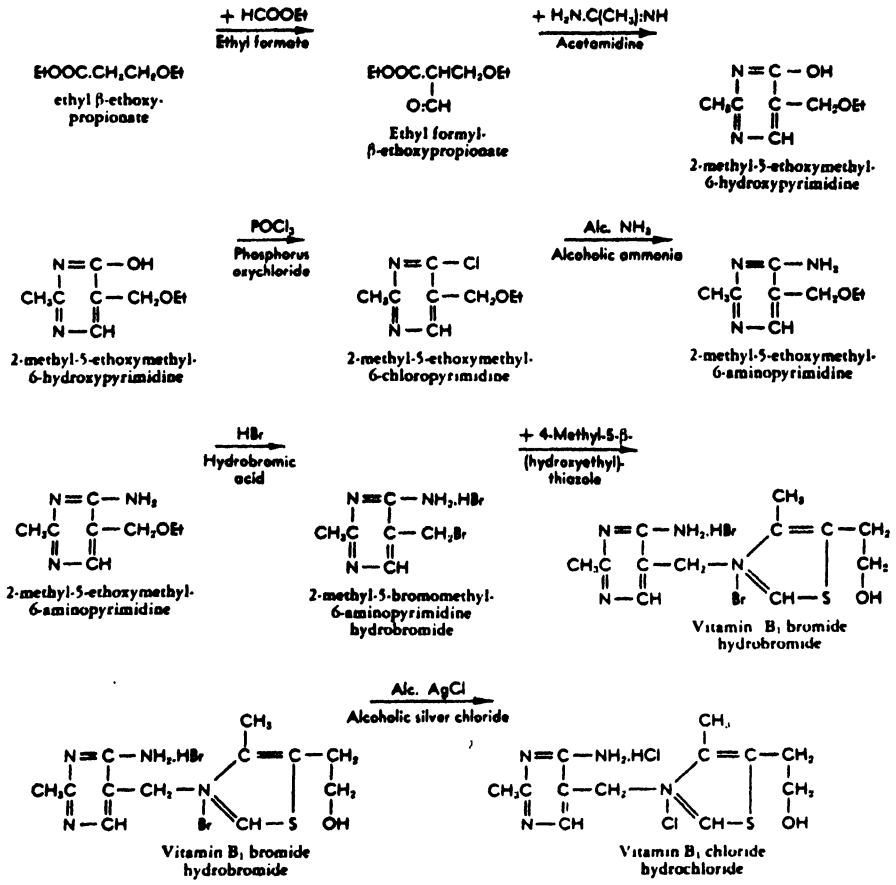

Figure 9. Williams and associates synthesis of Vitamin B_1

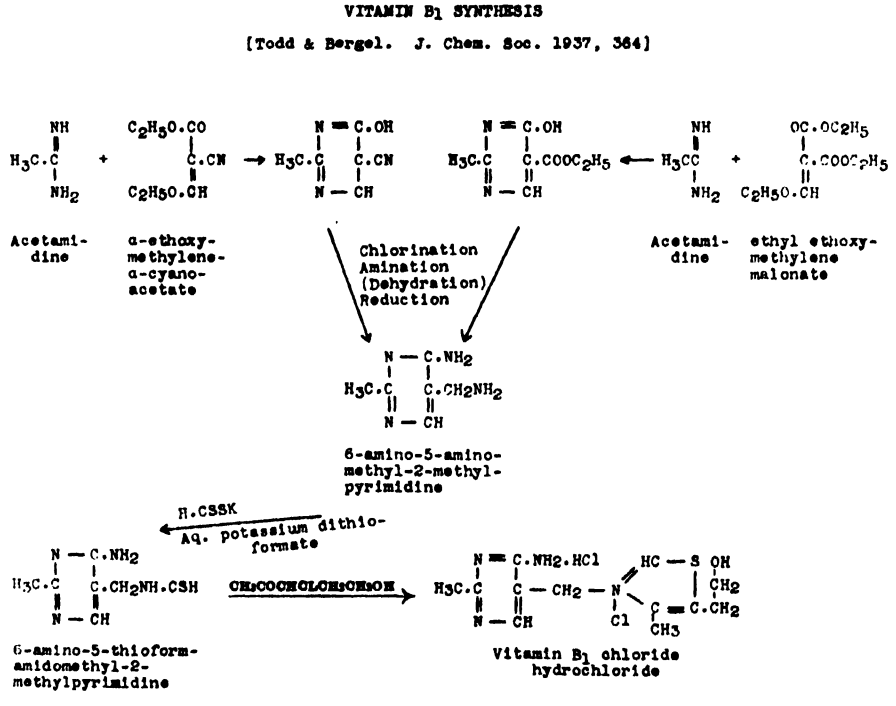

Figure 10. Todd and Bergel synthesis of vitamin B_1

a badly balanced diet, but that is as far as his studies carried him.

In 1897, a Dutchman named Eijkman, working in Batavia, Java, found that beriberi resulted from continuous consumption of decorticated rice. He used the pigeon (Figure 8) as his test animal. In 1928, Jansen and Donath, working in the same laboratory as Eijkman, first isolated vitamin B_1 in minute quantities from rice polish. R. R. Williams, who started work some thirty years ago on the same problem in the Philippines, developed a practical method of isolating larger quantities of

vitamin B_1 a few years later. However, it was soon obvious that large-scale equipment and chemical engineering skill would be required to produce the quantities of vitamin B_1 that were required to settle the structure of this vitamin. Dr. Williams turned to the author's laboratories for help on his problem. Larger quantities of vitamin B_1 were isolated and the structure of the vitamin was definitely established. Dr. Williams had previously carried out a crucial experiment, in which he had found that with sodium sulfite the vitamin could be split into two parts, a nitrogen-containing sulfonic acid and a sulfur-containing alcohol. In collaboration with Hans Clarke of Columbia University the latter was shown to be a thiazole derivative. After considerable additional work, the structure of the remaining fragment was determined by Dr. Williams and by Dr. Cline of our laboratory, and the synthesis was accomplished following an earlier synthesis of the thiazole moiety by Buchman and by Clarke and his associates. Independently the vitamin was synthesized by others, among them being Grewe, Andersag, and Westphal, and Todd and his associates. Two of these syntheses are graphically shown in Figures 9 and 10.

A good many strictly technical difficulties have been encountered in the manufacture of vitamin B_1. The synthesis of the vitamin involves a good many reactions, some of which are very complex.

Other troubles were also encountered in its manufacture. One particular step, in days gone by, was especially afflicted by its accompanying odor. One man was finally moved to quit. When asked the reason, he claimed that his girl left him in the middle of the dance floor! His odor had overcome his charm! Many people leaving work would have a slight but definite odor of "burnt rubber". One supervisor, on going to a movie, was somewhat embarrassed when the lady next to him rose and informed the manager that there was a short circuit or something burning near her. The manager, ushers, the lady, and others gave the area a careful inspection to find what was burning. However, the man was resourceful—he got down on his hands and knees and joined the search.

In 1915 Goldberger, a United States Public Health official, recognized that dietary deficiencies might play an important role in the development of pellagra, a disease that was common in our southern states. It is reported that 400,000 to 500,000 people suffered from this disease every year. Investigations by Elvehjem led to his demonstration in 1937 that nicotinic acid would cure black tongue in dogs, a condition analogous to pellagra in man. Previous to 1937 nicotinic acid had been isolated from rice polish, liver, etc., but no one had recognized the significance of these findings. In 1938 Spies and his co-workers reported that nicotinic acid (niacin) was effective in the treatment of human pellagra, and its use naturally has spread rapidly.

SYNTHESIS OF RIBOFLAVIN

[Karrer & Meerwein. Helv. Chim. Acta, 18, 1130 (1935)]

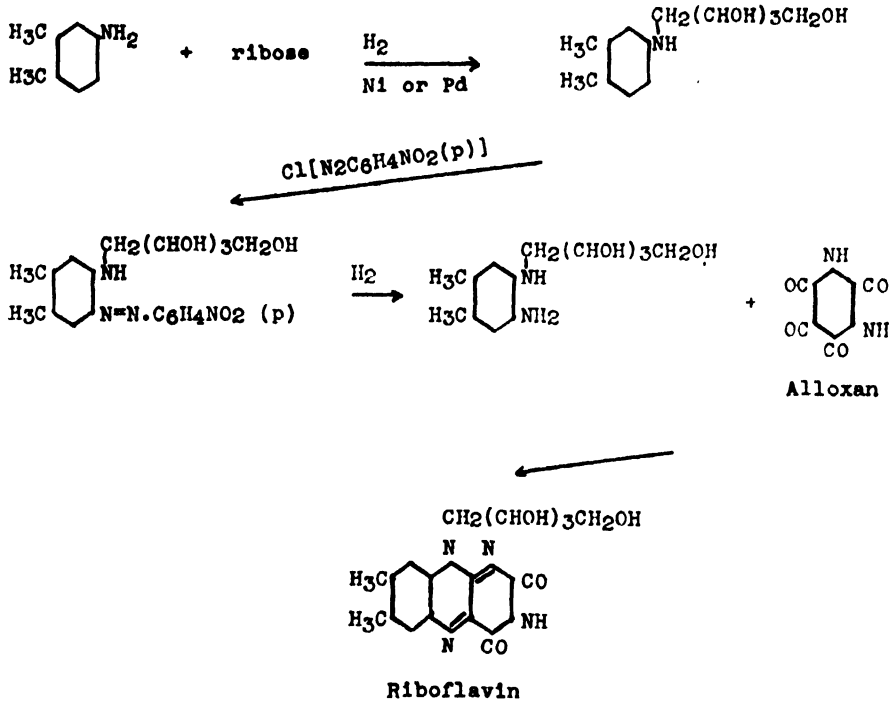

Figure 11

Nicotinic acid was first prepared in 1867 by Huber by the oxidation of nicotine with potassium chromate and sulfuric acid. Later it was found that nitric acid could be used as the oxidizing agent. Nicotinic acid may be made also by other methods, such as the oxidation of quinoline or β-picoline or by the bromination of pyridine, followed by its conversion to the nitril of nicotinic acid and then by hydrolysis. Nicotinic acid is made in large quantities by processes such as these.

Early in the work on the vitamins, it was recognized that there were at least two water-soluble so-called B vitamins, one stable to heat and the other unstable. The latter was designated vitamin B_1, and the second, the heat-stable factor, was termed vitamin B_2. Later it was found there were several heat-stable factors, all essential for the growth of the rat. Using this animal in his tests, Kuhn and others showed in 1933 that one of the heat-stable factors, later termed "riboflavin", was the same as a widely distributed and previously described yellow pigment in milk, liver, etc. He isolated the pigment from egg white and determined its structure. Both Kuhn and Karrer synthesized riboflavin in 1935. Karrer's synthesis is shown in Figure 11. Other methods have been developed in this country for the synthesis of riboflavin.

Medical interest in this vitamin dates from the work of Sebrell and Butler in 1938 who found that it prevented and cured certain fissures in the corners of the mouths of humans. Two years ago Sydenstricker found that it prevented and cured a certain type of keratitis. Recent examinations with the so-called slit lamp indicate that there may be a very widespread deficiency of riboflavin in the diet in this country.

In the manufacture of riboflavin the principal difficulty encountered has been the production of the ribose part of the molecule. Of course ribose is a very rare sugar. It has involved much work by night and by day, including Saturdays and Sundays, to find a good manufacturing process for riboflavin. It is one thing to make such a compound in the laboratory when one is interested in making perhaps a gram or two of it, but quite another thing to do it on a large scale with reasonably good yields. The manufacture of these vitamins is carried out in typical manufacturing equipment, although it is not made on anywhere near the scale to which our friends in the heavy chemical industry are accustomed.

During the course of Goldberger's work on the pellagra-preventing factor, he was able to produce a syndrome in rats which was called "rat pellagra" when the rats were fed on diets deficient in this pellagra-preventing factor. However, in 1935 György showed that rat pellagra was not caused by a deficiency of the pellagra-preventing factor but by a deficiency of a separate factor which he termed vitamin

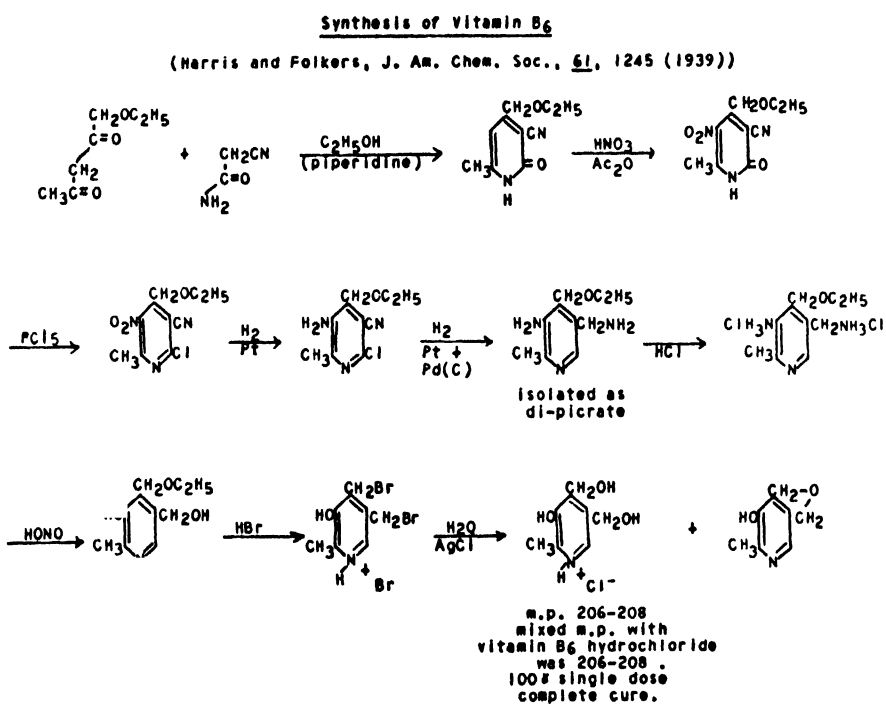

Figure 12

B_6, now known as pyridoxine. This compound was isolated by Drs. Keresztesy and Stevens in the Merck Laboratories and at about the same time in other laboratories by Lepkovsky, Kuhn, and Ichiba and Michi. Its synthesis was accomplished in the Merck Laboratories in 1939 by Drs. Harris and Folkers. As may be seen from Figure 12, the synthesis is not simple, but in spite of this a number of good classical organic reactions have been used in its preparation.

In 1933 R. J. Williams discovered an acidic substance which occurred in many natural products that would stimulate the growth of yeast. In the meantime other workers had found that chicks bred under certain special dietary conditions developed a dermatitis which was attributed to the lack of a so-called "filtrate factor". In 1939 Elvehjem and Lepkovsky and Jukes found that highly active concentrates of pantothenic acid would cure this chick dermatitis (Figure 13). Previously Williams had isolated a somewhat crude preparation of pantothenic acid from natural sources. He had shown that pantothenic acid was formed by the combination of β-alanine with a hydroxy acid. After the announcement of the probable identity of pantothenic acid with the so-called "filtrate factor" for chicks the collaboration of our laboratory was enlisted in the investigation of the structure of this acid. First the hydroxy acid was isolated from natural sources in the form of its lactone. This was shown to be the levo form of α-hydroxy-β,β-dimethyl-γ-butyrolactone. It was soon synthesized. Pantothenic acid was obtained by combining this lactone with salts of β-alanine or its ester followed by hydrolysis. Synthesis of pantothenic acid made it possible to establish without further question the identity of the chick "filtrate factor" with pantothenic acid.

As was mentioned previously, there has been a growing demand for calcium pantothenate and it is being manufactured in relatively large quantities.

In a study extending from 1929 to 1934 Dam and his associates described a deficiency disease of chicks which was characterized by a marked tendency to bleed. It was shown that the clotting time of the blood of chicks suffering from this disease was greatly prolonged. Dam found that hog liver contained a fat-soluble factor which would correct this condition. He termed it vitamin K. Subsequently Almquist obtained highly potent concentrates from alfalfa. Later Doisy and his associates succeeded in isolating what they termed vitamin K_1 in alfalfa and K_2 in fish meal. The structure of the more important of these, vitamin K_1, was found to be 2 - methyl - 3 - phytylnaphthoquinone. Doisy, Fieser, and Almquist synthesized it in 1939. Subsequently it was announced by Fernholz and Ansbacher that 2-methylnaphthoquinone was as active or possibly more active than vitamin K_1 or vitamin K_2. The manufacture of vitamin K_1 for use in medicine is not great. Larger amounts of the cheaper 2-methylnaphthoquinone are used.

Figure 13

In a study dating back to 1922 Evans and his collaborators have found that a dietary constituent is necessary for normal reproduction of rats. It was found that wheat germ oil was a rich source of this factor which has been termed vitamin E or tocopherol. It was present in other natural oils also. Concentrates of these oils were made and crystalline derivatives of vitamin E, or α-tocopherol as it has become known, were prepared. Subsequently other tocopherols—namely, β- and γ-tocopherols—were found which differ from α-tocopherol in the number of methyl groups contained about the chromane nucleus of the molecule. The structure of α-tocopherol was determined by Fernholz in our laboratory and the synthesis was accomplished by Karrer in Switzerland, Todd in England, and Lee I. Smith of the University of Minnesota in this country.

The importance of cooperation among academic laboratories, research institutes, and industry and the need for a friendly understanding by each of the needs, goals, and problems of the others cannot be emphasized too much. The growth of modern industry is almost entirely dependent upon the great advances in pure science. Industry too has contributed much. It has made the findings of the pure scientist available to society. Discoveries in pure science are apt to become and remain sterile from the point of view of society unless industry makes use of them in some way. Examples of the great developments in industry based upon pure science are found in the great electrical industry which is so largely based upon the work of Faraday and other great pure scientists, or in the development of the dye industry which is based upon the work of the organic chemists of this country and abroad. This list could be increased almost ad infinitum.

Industry contributes to pure science by financially supporting research in universities and research institutes. It has made special chemicals, facilities for large-scale work, bioassays, and other expensive analyses and assays available to academic workers. It is very important that this work be continued, and it is very important too that it be continued to the mutual satisfaction of both the parties concerned. To attain this it is essential that the two groups understand what each is trying to achieve. The primary purposes of the academic institutions, of course, are the training of youth and the expansion and extension of man's mental horizons. These purposes are significant and im-

portant. The purpose and reason for the existence of the manufacturing industries are, of course, to manufacture and sell something that people want and need—in other words, to satisfy demands for some article or material. In doing this patents play an extremely important role. Patent protection on a new process or product is often necessary to obtain the money necessary for the equipment and facilities required to begin manufacture. Many writers state that the American patent system is responsible in no small measure for the remarkable development of American industry. However, the subject of patents is one on which the views of many academic investigators and industrial research investigators and business men differ widely. To achieve any real cooperation it is most important that both academic and industrial scientists achieve as thorough an understanding as possible of the purposes, benefits, and limitations of our American patent system.

In conclusion some general comments on the significance and social value of this food accessory business, the manufacture of synthetic vitamins, may be of interest. Through Claude R. Wickard, Secretary of the U. S. Department of Agriculture, the Government has issued a little pamphlet entitled "Food Will Win the War and Write the Peace". It states, "Food is a whole arsenal of weapons in this struggle for human freedom. It is the driving force behind high production by munition workers, and top-notch performances and strong morale among soldiers and sailors."

Somewhat in the same vein, Russell M. Wilder of the Mayo Clinic and former chairman of the Committee on Food and Nutrition of the National Research Council has written, "Famine has always contributed to defeat of armies and subjugation of nations. This has long been recognized, but in the past it was mistakenly thought that famine could be prevented if only the supply of food sufficed. The newer knowledge teaches that the nutritive quality of the foods supplied is of the utmost importance. . . . Caloric energy is needed, but no more than much else in food. . . . The new knowledge of nutrition has emphasized particularly the importance of what once were called accessory factors, namely salts and vitamins. . . . Vitamin deficiencies constitute the principal 'hidden hungers', subclinical abnormalities which until lately, for the most part, were unrecognized."

This new industry in synthetic vitamins is making it possible to satisfy many of these "hidden hungers" and to improve the nutrition and well-being of our people.

In comparing the contributions of the nutrition workers of the 20th century with those of earlier workers in the 19th century, such as Pasteur and Lister, from whose work came a recognition of the bacterial origin of disease, we may conclude that the social value of the present work in nutrition would appear to be as significant as that of the 19th century investigators to whom mankind owes so much.

"Flash of Genius" Patent Doctrine and the Chemist

THOMAS CIFELLI, JR., 3 Clarendon Place, Bloomfield, N. J.

THE United States Supreme Court has recently sanctioned a doctrine of patent law which, it is thought, will vitally affect the chemical industry and the future of industrial research in America. In the case of the Cuno Engineering Corp. *vs.* the Automatic Devices Corp., U. S., 62 Supreme Court 37; 51 *United States Patents Quarterly* 272 (1941), the court held that the test of patentability is whether a "flash of creative genius" is revealed by the alleged invention. The high court proclaimed that, unless a strict application of this test reveals the presence of such a flash, a patent is invalid for want of invention.

The matter is deemed sufficiently important to the chemical profession to warrant a note on certain aspects of the situation even though others (*2*, *3*) have already delineated the significance of this principle of law. The hope is expressed that the chemists of the Nation will clearly see the situation as it affects them and their entire industry and will take proper action to protect their legitimate interests.

The new test of patentability, if adhered to, will necessarily result in the invalidation of most chemical patents. These patents are in great part the result of planned, scientific research. It is not seen how the chemical inventor, along with other technically trained inventors, can qualify under a strict application of the Cuno case test in the majority of cases. In this connection it may be well to consider the remarks of one of the ablest present-day jurists on patent law, Judge Learned Hand of the Second Circuit Court of Appeals, who in Ruben Condenser Co. *vs.* Copeland Refrigeration Corp., 85 F. (2d) 537 (1936) stated:

> Especially in chemical and electrical experiments happy solutions may be reached by testing out variants reached merely by permutations of old elements. Possibly the patent law should protect such industrial achievements, but it does not; the work of the well-equipped laboratory which by trial and error checks off a series of formulas may be the proper path of industrial advance, as the Germans found it to be before the Great War; but it does not demand what we call "invention".

Thus, although no line of cases in point is as yet available in aiding one to grasp an intelligent idea as to how the test will be applied in practice, it seems likely that a strict application of the test as called for by the Supreme Court will result adversely to chemical inventors.

In view of the long line of statements (e. g., *4*) to the general effect that the United States patent system is one of the most important factors in the development of industrial research as we know it, the significance of the impact of the new test of patentability on the future of industrial research is apparent. If industry finds it all but impossible to acquire valid patent protection on inventions, will industry continue to expend large sums of money on research? Here the problem touches the chemist, inventor or no, for with retrenchments in research a decrease in the number of chemists employed in industry would appear to follow. Of greater importance is the adverse effect the test, which will likely discourage inventiveness, will have on the "progress of science and the useful arts" in the United States—for which quoted purpose the Federal Constitution empowers Congress to legislate on patent matters.

Before considering what part the chemical profession can play in combating the new threat to the future of research, it might be well to consider the foundations upon which the Cuno case test rests. It is believed that no foundation can be found in the United States Constitution or in any of the patent statutes. The conclusion one arrives at is that the test is based on a concept which is the product of the juristic mind. The judges have decided that the drafters of the Constitution and the statutes did not intend to reward inventors other than those of the "genius" type.

One is entitled to give thought to

whether the new test is even calculated to reward inventors who actually contribute to the progress of science and the useful arts. Demma (*2*) points out that Edison's incandescent lamp, Marconi's wireless, Morse's telegraph, and Bell's telephone inventions were all the result of hard work and tireless effort; none were creatures of "flashes of genius". No one can seriously contend that the manner in which an invention springs into being bears any relation to its contribution to progress. Consequently, it is not understood how the Cuno test meets the constitutional directive that inventors are to be rewarded for their contributions to society. It seemingly leads to the conclusion that even the outstanding inventions above are not entitled to patent protection and it stresses form—how the invention comes into existence—to the exclusion of substance—what the invention contributes to progress.

Having recognized the stake of chemists in the situation, what can they do about the matter? The answer appears to lie in helping to educate the general public on the true relationship between patents and industrial progress (*2*). The problem is essentially one which involves public rights. The courts actually believe that they are protecting those rights by applying a test such as the "flash of genius" doctrine. The general public knows practically nothing about the effect of the patent system on its economy and hence is not in a positition to know whether its rights are even remotely involved in patent matters. So long as this condition prevails, the public cannot be aroused to make its voice heard when actions, supposedly taken to protect its rights, actually affect them adversely. There is already practically conclusive evidence, if any be needed, of the results which can be obtained when an informed public acts through democratic processes. One may feel confident that if the public is permitted to realize the true part that the patent system plays in the Nation's economy, a doctrine such as the "flash of genius" concept, which appears to bear no relation to the progress of science and the useful arts, will soon find its resting place with other discarded doctrines.

Education of the public is a task that, it would seem, can best be accomplished by responsible representatives of the groups from which most inventors come, working in collaboration with the patent bar. A committee of the Patent Section of the American Bar Association has already presented such a suggestion (*1*), but as yet no definite action by this body has been taken on the matter.

At the same time, since education of others presupposes knowledge in the ranks of the teachers, the advisability of grasping a clear concept of the fundamental principles and philosophy of the United States patent system might well be considered by the chemists and by other large inventor groups. The principles concerned are relatively few and easy but it is nevertheless true that many chemists, even those who have obtained several patents, have misconceptions concerning these principles. Probably many chemists believe that a patent gives the patentee the right to practice his invention. This is not so. The patent merely gives the patentee the right to use the federal courts to try to exclude someone from practicing the patentee's invention. The patentee himself may not be entitled to practice his own invention. The reason for this state of affairs lies in the fact that the patentee, by practicing his own invention, may infringe an adversely-held broader or dominating patent.

Education of chemists in patent matters may proceed along several directions. One would involve the sponsorship by professional and scientific organizations of more talks on the patent system. Practicing chemists should find these talks of interest. As for the chemists of tomorrow, colleges and universities might offer special courses in patent law for chemists or include some lectures on the patent system in another course given in the senior year.

Another task with which the chemical profession might concern itself is a fair and critical study of Monograph 31, T. N. E. C. (*5*). This monograph is believed to bear a close relationship to the subject at hand. It is a strong indictment of the patent system for many of its alleged abuses. The monograph contains a number of proposals for changes in the system. An inkling of its importance is indicated by the fact that the Temporary National Economic Committee's recommendations for changes in the patent system seem to be based entirely on this monograph. Also it might be well to consider the similarity between the "flash of genius" doctrine enunciated by the Supreme Court and the following excerpt from page 156 of the monograph which, it may be added, was cited with apparent approval in the Cuno case:

> An insistent task is a definition of "patentability". All inventions derive from common knowledge; they differ in the quality and magnitude of their contribution to the industrial arts. As respects origin they fall into three rather distinct classes: first, creations which exhibit individual insight; second, derivative processes, worked out by professional staffs, equipped with laboratory facilities . . . The mark of the first is genius; of the second professional competence . . . It was patience on the part of the man of genius which the Constitution wished to reward; the mere display of capacity to contrive has been repeatedly frowned upon by the United States trails which need to be followed.

It is perhaps proper to point out that new machinery which may result in placing the patent system on a proper foundation is probably even now beginning to function. A new five-man National Patent Planning Commission has recently been set up by the President to make a complete study of the patent system and to present its recommendations for proposed changes therein, with particular regard to matters relating to postwar conditions. The personnel of the commission is outstanding, including Charles F. Kettering, chairman, Owen D. Young, Chester C. Davis, Edward F. McGrady, and Frances P. Gaines. However, it is hoped that the chemical profession will not permit any complacency, arising out of the creation of this investigatory commission, to interfere with the profession's task.

NEWS-MAKERS

Osborne Bezanson, general manager of the Texas Division of the Monsanto Chemical Co., was elected a vice president of the company at the regular monthly meeting of the board of directors.

Lieutenant George B. Campbell, until February 1 a patent attorney with Allied Chemical & Dye Corp., is assistant port intelligence officer for the Boston Sub-Port of Embarkation.

French E. Dennison, in charge of the Small Commercial Refrigeration Development Department, York Ice Machinery Corp., has been called by the War Department to serve as chief inspector for the Philadelphia Ordnance District.

L. A. Du Bridge, director of the Radiation Laboratory, Massachusetts Institute of Technology, addressed a joint meeting of the New York Section of the American Institute of Electrical Engineers and the New York Electrical Society on April 15 on "Science and Engineering in the War Effort".

Cyrus G. Dunkle, for several years a chemist in the Research Section of the Chemical Laboratories, Picatinny Arsenal, Dover, N. J., has been ordered to active duty in the Chemical Warfare Service. Captain Dunkle is serving at present as assistant chemical officer, Headquarters Ordnance Training Center, Aberdeen Proving Ground, Md.

In recognition of his "untiring devotion to the advancement of science", **H. A. B. Dunning,** president of Hynson, Westcott & Dunning, Inc., Baltimore, Md., was awarded the degree of doctor of laws *honoris causa*, by The Johns Hopkins University at commemoration day exercises, February 23, 1942. Dr. Dunning is a member of the Advisory Committee of the university's Department of Chemistry.

Harry B. Feldman, Chemical Engineering and Chemistry Department, Worcester Polytechnic Institute, is now on active duty as a captain in the Chemical Warfare Service, U. S. Army, at the Chemical Warfare School, Edgewood Arsenal, Md.

Charles F. Fisk, who for several years has worked as development chemist at the Providence plant of the U. S. Rubber Co., was transferred in January to the Munitions Division, Des Moines Ordnance Plant, Department of Product Quality Control.

R. G. Forsberg has been appointed purchasing agent of the Jessop Steel Co., Washington, Penna.

William F. George, associated with *Chemical Industries* for many years, has joined the sales organization of the Hooker Electrochemical Co. Mr. George will be in charge of the New York office in the Lincoln Building, 60 East 42nd St. He will devote his efforts generally to trade contacts in the Metropolitan New York area.

Horace J. Grover has been named a research physicist on the staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to research in industrial physics.

H. B. Higgins

H. B. Higgins, who has been associated with the Pittsburgh Plate Glass Co., Pittsburgh, Penna., since 1905, has been elected executive vice president of the company. Mr. Higgins is a director and has been a vice president since 1928.

Louis A. Hoffman

Louis A. Hoffman has been elected president and general manager of the Hilton-Davis Chemical Co., Cincinnati, Ohio, succeeding the late **A. B. Davis.** Mr. Hoffman has been associated with the company since its inception in 1922, first as research chemist and since 1936 as vice president and treasurer. **James F. Thompson, Jr.,** was elected vice president in charge of research and **George Nieder,** vice president in charge of sales.

Robyn M. James has joined the bacteriological staff of the Commercial Solvents Corp. and is working at the research laboratories in Terre Haute, Ind.

Alfred Kauffmann, B. A. Gayman, and **J. Reece Lewis** have been re-elected directors of the Link-Belt Co., Chicago, Ill., for three years. Two new directors were elected: **Clarence Tolan, Jr.,** and **William C. Carter.**

Chris P. Keim has left the Hygrade Sylvania Corp. to become an industrial fellow at Mellon Institute, Pittsburgh, Penna., for the Iodine Educational Bureau, Inc.

Alfred Kent, formerly Dallas, Tex., representative of Manning, Maxwell & Moore, Inc., Bridgeport, Conn., is now on active duty as an ensign in the U. S. Navy.

Raymond J. Kepfer has been transferred by the Grasselli Chemicals Department, E. I. du Pont de Nemours & Co., Inc., from his position as research chemist at the Cleveland research laboratory to a position as a sales service technologist at the Chicago sales office.

Harry C. Kremers, The Harshaw Chemical Co., Cleveland, lectured on "Synthetic Optical Crystals" at the University of Illinois, March 26, before a joint meeting of the Alpha Chapter of Phi Lambda Upsilon and the Beta Chapter of Alpha Chi Sigma.

Frederic I. Lackens, advertising manager, The Hays Corp., Michigan City, Ind., was appointed vice president of the National Industrial Advertisers Association at a meeting of the board March 27 in Cleveland.

Gordon MacLean, sales manager of the Turbo-Mixer Corp., New York, is leaving to join the Allied Molasses Corp., as technical director.

Samuel H. Maron, since 1938 assistant professor of physical chemistry in the Department of Chemistry and Chemical Engineering, Case School of Applied Science, Cleveland, Ohio, has been promoted to associate professor of physical chemistry.

James Wellford Martin has given up his consulting practice in the field of solid carbon dioxide and refrigeration for the

duration of the war and has accepted a position with Sanderson and Porter as chief engineer on construction of the Pine Bluff Arsenal, near Pine Bluff, Ark.

J. Strother Miller, technical adviser of the Barber Asphalt Corp., Perth Amboy, N. J., retired April 15 after 33 years of service in all phases of the technical activities of the company. He will continue his interest in asphalt as a consultant.

Allan d'Apery Mills has joined the laboratories of the Quaker Chemical Products Corp., Conshohocken, Penna., as organic research chemist. He was previously associated with Röhm & Haas. **J. Perzanowski,** formerly connected with the laboratories of the United Gas Improvement Co., has also joined the company as organic chemist, working on special assignment. **Ruth Smock,** a graduate of Temple University, has been employed in the control laboratory.

James F. Olsen has been appointed sales manager of the Turbo-Mixer Corp., New York.

Paul D. Peterson has been appointed director of agricultural research for the Freeport Sulphur Co., to head the company's development of new agricultural uses of sulfur. Headquarters will be in New Orleans

Henry D. Ralph, for 15 years head of the Washington Bureau of the *Oil, Paint, and Drug Reporter,* has been forced by ill health to terminate his connection. He has been succeeded by **Ralph Cherry,** recently chief of the Washington Bureau of the *Journal of Commerce.*

Warren H. Reinhart has been detailed by the National Institute of Health to the Louisiana State Health Department, New Orleans, La., as an industrial hygiene engineer to help establish industrial hygiene work in Louisiana.

Charles A. Rhodes has accepted the position of sales representative in the Poultry Feed Department, Special Products Division, The Borden Co., Springfield, Ohio. He was formerly employed by the Mountain City Mill Co., Inc., of Chattanooga, as chief chemist and director of products control and development.

V. L. Sanderson and William Bradford have been appointed sales representatives of the Cochrane Corp., Philadelphia, Penna.

Jerome Schaul, Jr., has accepted a position as supervisor, physical testing laboratory, United States Rubber Co., Des Moines Ordnance Plant, Des Moines.

William S. Shipley, chairman of the board of the York Ice Machinery Corp., was presented a special Citation of Merit at the fifth annual award dinner of the National Association of Publicity Directors, for work of the highest value in the building of national defense.

J. O. Small, formerly vice president and technical director of the Arco Co., Cleveland, Ohio, has joined the Synthetics Department of Hercules Powder Co., Wilmington, Del. He will be engaged in technical development work in the use of synthetic resins and rosin esters, particularly in their application to war materials.

Joseph J. Thomas, formerly on the research-sales staff of the Röhm & Haas Co., has joined the research department of the S. D. Warren Co., Cumberland Mills, Maine.

R. B. Tucker

R. B. Tucker, director of glass sales of the Pittsburgh Plate Glass Co., has been elected to the board of directors of the company, succeeding **H. A. Galt** of Akron, Ohio, who is retiring from the company after more than 40 years of continuous service. Mr. Tucker has been associated with the Pittsburgh Plate Glass Co. since 1929 when he was appointed manager of glass sales. Previous to that time he was president of the Standard Plate Glass Co.

J. D. Van Valkenburgh has been appointed assistant to the president of Irvington Varnish & Insulator Co., Irvington, N. J. For the past several years Mr. Van Valkenburgh has been associated with the Johns-Manville Corp., New York.

Wm. Lloyd Evans to Receive Award

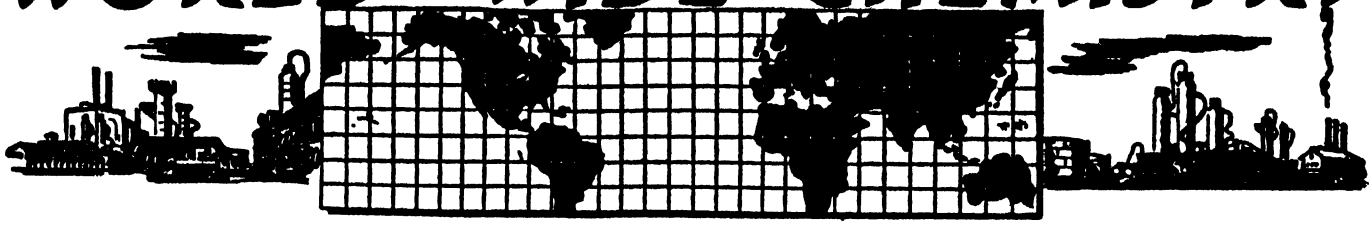
At the annual meeting of the American Institute of Chemists, May 16, 1942, at the Claridge Hotel, Atlantic City, N. J., the institute's medal, presented annually for outstanding service to the science and the profession of chemistry in America, will be awarded to William Lloyd Evans, chairman of the Department of Chemistry 1928 to 1941, and now professor emeritus, Ohio State University, and Past President of the American Chemical Society.

The award is made in recognition of Dr. Evans' outstanding accomplishments in the field of oxidation of organic compounds, particularly in the oxidation of carbohydrates, and for his contributions to the profession as an educator.

Herty Medal Award

The Department of Chemistry, Georgia State College for Women, Milledgeville, Ga., has set May 2 as the date for awarding the Herty Medal to Townes R. Leigh, dean of the College of Arts and Sciences, University of Florida, in recognition of distinguished services as a teacher and his research in plants and soil. After presentation of the medal, Dr. Leigh will give a talk on "The Spirit of Science".

KAIDEN-KEYSTONE



R. M. Curts

E. M. Kolb

E. M. Kolb, with American Potash & Chemical Corp., New York, since 1932, has been appointed manager of potash sales. R. M. Curts becomes manager of borax sales and continues, as formerly, to handle sales of bromine, bromides, and lithium salts. Mr. Curts has been with the company since 1931.

WORLD-WIDE CHEMISTRY

Demand for industrial chemicals is still increasing in the British market, and manufacturers are busy making deliveries on old and new contracts. Evidence of difficulties faced by suppliers of merchandise in strong demand is provided by several new orders dealing with the sale of chemical products. A license is now required for the disposal of coal-tar naphtha and xylene, and the Secretary of Mines has been authorized to give directions on their distribution, treatment, use, and blending. Use of zinc oxide and lithopone in production of rubber footwear is controlled, and that of lamp black and titanium oxide prohibited.

No ethylene glycol, glycerol, or ethyl or methyl alcohol is released for the manufacture of antifreeze mixtures for internal combustion engines, and manufacturers of antifreeze mixtures have been requested to inform the authorities of the chemical composition of their products before undertaking production. For essential transport and civil defense ethylene glycol and glycerol are allocated by the Ministry of War Transport. The system of export licensing has been extended to lead acetate, sodium acetate, synthetic rubber, and iodine compounds. A British Varnish Gum Merchants' and Graders' Association has been formed for consultation with the Ministry of Supply, especially with regard to the implementing of the recent order imposing the license system on purchase, use, and disposal of dammar, copal, gum dammar, and gum copal.

Tendency to Utilize Products Formerly Wasted Increases

The Department of Scientific and Industrial Research has pointed out possible sources of earth colors in Great Britain. A colliery at Wigan could produce 1 ton of ocher a week, if the water from its pumps were tanked and the ocher allowed to settle. The Severn Valley Gas Corp. is recovering a carbon paste during the manufacture of gas in a new Jones tar gas plant, and this is being used in the manufacture of camouflage paints. The white sludge from locomotive water softening plants is used as a fertilizer by market gardeners. These examples reflect a tendency to utilize waste products formerly ignored.

New Process Improves Tar Extraction from Peat

The London Chamber of Commerce reports a new process for extraction from peat of over three times the quantity of tar obtained with existing methods. The process gives a correspondingly larger yield of Diesel and other oils. It is also hoped to obtain about 2 per cent of carbohydrates from the tar water, yielding acetone for the manufacture of cordite. The new method for carbonizing peat has not been applied on a commercial scale.

Micaceous Hematite Is Used for Arc-Welding Rods

An Empire substitute for Swedish magnetite, formerly used for arc-welding rod coatings, has been discovered in the form of micaceous hematite from Sierra Leone. Part of the hematite is obtained in the form of micaceous concentrates which must be briquetted or sintered before they can be smelted in the iron industry. As the British sintering capacity is fully occupied, experiments were undertaken to develop alternative uses. In arc-welding rod manufacture the material has proved successful. Use in the paint industry was also attempted, but the flakes were too thick.

Use of Vermiculite In Insulation Gains

Increasing quantities of vermiculite are used for heat and sound insulation. Supplies of suitable material have been located in the Union of South Africa and Tanganyika. African vermiculite is being used in Great Britain, while Australian material finds an outlet in the local market.

Magnesite from Africa Replaces Greek Supplies

To make up for the loss of Greek magnesite British users have had to rely on various deposits in West and South Africa, and substantial tonnages are being received. In Kenya also a magnesite deposit has been opened up, and a calcination plant has been erected.

Dyeing Problems Examined by Technical Advisory Committee

The Technical Advisory Committee of the Society of Dyers and Colourists, appointed last December, is in full action. Consisting of 55 members, it works by means of small panels on water supplies and treatment; general chemicals including auxiliary agents; raw materials, intermediates, and coloring matters; chemistry and physics of fibers, fibrous materials, and plastics; preparatory and finishing processes; dyeing and printing; and testing and standardization.

Economies in Dyeing Cotton Investigated

Economies in dyeing cotton with mineral khaki by impregnation with chrome alum and iron alum followed by development with potassium chromate have been studied by E. Race, F. M. Rowe, and J. B. Speakman of the University of Leeds. They report that, if after each developing operation the sulfuric acid formed is neutralized with sodium hydroxide solution, the developing liquor can be used about five times without appreciable change in shade of the dyed cotton and about ten times before the potassium chromate is exhausted. When pH value, chromate content, and volume of the developing solution are adjusted to their original values after each development, the liquor can be used indefinitely as a standing bath. However, the deposits of chromium and iron chromates and ammonium and sodium sulfates must be removed when their presence interferes with the successful working of the material in the developing liquor.

Nonfelting Wool Production Creates New Chemical Outlets

Government specifications for uniform cloths and utility clothing have stimulated production of nonfelting wool, a material

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

chemically treated so as to reduce or eliminate shrinkage on washing and milling. A variety of processes for nonfelting wool are used in British textile mills. The original wet chlorination process is generally applied in developed forms using organic hypochlorites, sulfuryl chloride, or nitrosyl chloride. Thionyl chloride, sulfur trioxide, concentrated sulfuric acid, oleum, sulfur monochloride, or sulfur dichloride are also used. For washing wool after nonfelting treatment, a bath containing a weak alkali solution may be used. Instead of sulfuryl chloride its components, sulfur dioxide and chlorine, are used in a closed chamber to generate sulfuryl chloride. An improved process based on sulfuryl chloride, which uses isocyanates as an addition, is said to counteract harsh and unattractive handle and to permit treatment of the wool at higher temperatures.

Great progress has been made in British woolen mills with the alkali process of nonfelting wool. Normally sodium or potassium hydroxide is used with butyl alcohol as a solvent, while neutralization may be carried out in an aqueous solution of sulfuric acid. Another process is using alkali sulfides, polysulfides, or hydrosulfides in organic solvents. This method is said to have proved very successful for the treatment of materials which contain wool in mixtures with other fibers.

Although it is not yet known which of these processes will ultimately prove most successful, the nonfelting industry will absorb large quantities of various chemical products. Possibly the consumption per rate of production will decline as improved methods for the recovery of nonfelting chemicals are developed, but the demand as a whole is likely to increase, especially if the nonfelting wool treatment is extended to cloths for strictly civilian use. Nonfelting wool requires special attention in dyeing. It seems to take up more dyestuffs than untreated material, although the absorption can be rectified by shortening the time of dyeing, and the effects obtained were not always the same as for untreated wool. Nevertheless the problems are not insurmountable, and the handle and appearance can be improved if small amounts of untreated wool are added to the nonfelting material.

Enforced Tin Economies May Help Lacquer Industry

Loss of eastern sources of tin has caused British authorities to introduce several measures intended to save tin for essential purposes. Where tin is used as a metal in soldering and bearing alloys, certain economies will be effected by increased use of lead. Lead tubes are likely to be used on a substantial scale in the place of tin-coated collapsible tubes. Cadmium and bismuth will be used in solders and bearing metals for special purposes, although these materials are not in too plentiful supply. As food cans are seldom stored for more than a year, it is hoped that substantial use can be made of lacquered plate instead of tin plate in the canning industry, and lacquered sheets will also be used for oil containers, etc.

National Fertilizer Rationing Scheme under Consideration

Distribution of chemical fertilizers to British farmers will undergo an important change when the national rationing scheme being prepared by the Ministry of Agriculture is introduced. Sales of chemical fertilizers containing potassic and phosphatic materials were heretofore subject to certain restrictions intended to ensure that the limited supplies of these substances are used to the best benefit. Only those farmers who grow crops reacting strongly to additional supplies of potash are permitted to use these salts and only on the crops for which allocations have been made. In Norfolk and East Sussex rationing schemes for other fertilizer materials have been introduced, and these seem to have worked so successfully that this system will be extended to the whole country. Farmers will receive fertilizer coupons calculated on the basis of the 1943 crop program which must be approved by the authorities so that equal distribution of available supplies and utilization for crops in greatest need of fertilizer is guaranteed. The Ministry of Agriculture has in the past paid considerable attention to the question of chemical fertilizers, especially as applied to new crops, and an experienced staff of experts is at the disposal of British farmers to advise them on the need of manuring in fields which, as part of the wartime farming program, have been changed over to different crops.

New Outlets for Coke Developed

Increasing demand for liquid motor fuels, solvents, chemicals, and gas from coke-oven plants and gasworks has boosted research in this sector of the coal manufacturing industry. Many developments of importance have taken place, but details are not available for publication. Generally it has been found that the normal relation in the demand for gas, coke, and liquid products has been disturbed so that there is at times a surplus of coke as well as heavy coal-tar derivatives. The problem of disposing of surplus coke has therefore received great attention, particularly since it is believed that this change in demand for various gasworks products will remain effective after the war. New outlets for coke have been discovered, and may be developed, in crop drying, soil warming, heavy-duty cooking, and in various transport services—for gas producers and steam wagons—as well as in stationary gas producers and special furnaces for high-temperature processes. The calcium carbide industry, established in the British Isles during the war, may provide an important outlet for coke. If in the future greater reliance must be placed on motor fuels derived from coal, coke may be used for the production of water gas. On the other hand, the chemical industries may help coke producers to extend existing markets, e. g., by alkali-activation which will permit use of coke instead of bituminous coal in ordinary open-grate fires.

G. Abrahamson

Continental Europe

Germany Ships Quantities of Chemical Products to Finland

Under a recent trade agreement between Germany and Finland, German chemical manufacturers have begun to send large quantities of chemical products, fertilizers, salts, and coke to Finland. The amount of goods sent from Germany to Finland is substantially larger than that shipped in the opposite direction so that long credits have been granted by German financial institutions. Finnish deliveries to Germany consist largely of wood products.

Institute for Chemical Technology of Synthetic Fibers Founded at Breslau

An institute for chemical technology of synthetic fibers, the first of its kind in Europe, has been opened at the Technical College of Breslau, Silesia. At the formal opening Director-General Dörr, who plays an important part in the German synthetic fiber industry, said that many hundred thousand tons of chemical fibers are being produced in the country. Among urgent technical problems to be solved he mentioned broadening of the raw material basis by use of pine wood and annual plant materials, e. g., straw, and profitable use of hemicellulose which is now carried through the plants as ballast but could supply over 100,000 tons of protein as well as resin and fatty acids, pectin, vanillin, and waxes. In view of the growing importance of transport and transport costs, recovery of sodium hydroxide, sulfuric acid, and carbon disulfide receives special attention even if requiring additional expenditure. Profits of the industry, he stated, have been improved by introduction of the almost completely continuous production process, while different purposes are served by different viscose fibers adjusted in production to their future use. More complete utilization of wood is being achieved by prehydrolysis.

New Process for Casein Fiber Production on Commercial Scale

Thüringische Zellwolle A.-G., Schwarza, Thuringia, claims that a new process for the manufacture of casein fiber developed in its plant has considerable advantages over the original Italian process. Production, now on a commercial scale, starts from rennet, yielding fodder whey as a by-product. The rennet casein is made water soluble by treatment with a lye, undergoes a fermentation process, is precipitated as a fiber into a bath generally containing sulfuric acid and sodium sulfate, passes through sodium chloride and aluminum sulfate baths, and is finally treated with cold and hot formaldehyde.

New Synthetic Resin Glue Permits Easy Application

Henkel & Cie., Düsseldorf, are manufacturing a new synthetic resin glue which is marketed as a dry powder and can be mixed with cold water without any of the auxiliary products normally used. It is described as a low-molecular condensation product of melamine and formaldehyde.

Hardwood Substitute Made of Straw, Grass, and Resin Binder

Straw, grasses, and sawmill waste are used as raw material for a new hardwood substitute, claimed to be rot- and mildew-proof. It is made from a mixture of felted organic fibers and a hardening resinous binder. The strength of the material is the same in all directions. Two types are manufactured, one for ordinary purposes and another to replace imported hardwood. Both types are available in a special water-resistant finish.

Iodine Is Conserved by Use of Phenolic Solution

To save iodine, tincture of iodine is being replaced in many cases by a 5 per cent solution in alcohol of chlorated alkylated phenols in conjunction with quarternary ammonia salts.

Acid-Resistant Mortars, Cements Take Place of Imported Materials

A large variety of acid-resistant mortars and cements have been placed on the German market in recent years. Asplit, a synthetic resin material, gives considerable protection against acids, including mixtures of 95 per cent sulfuric and 75 per cent fluoric acid, withstands liquid penetration, and owing to good adhesion is used extensively for timber and concrete structures. Aristogen, a bituminous emulsion, is used as an insulation material against ground water. It can be applied at normal temperatures on wet surfaces. · Asfluid is a bituminous substance which possesses great resistance against dry heat, salts, and acids, and is used mainly for protective coats on roofs, chimney joints, tar-free insulation materials, etc. Höchst is a water-glass mastic used to give protection against all acids except fluoric acid, chlorine, and bromine up to temperatures of 1,000° C., water and steam, and neutral solutions of salts.

Lithopone Satisfactory for Luminous Painting Purposes

Although zinc sulfide has been found an excellent material for luminous paints, it is too expensive for use on large surfaces. A white lithopone paint has been developed which is economical and gives sufficient afterglow for 4 hours after lights are turned off. One pound is said to be enough for 20 to 30 square feet. For signs and other purposes where special visibility is required, zinc sulfide paints are still being used in Germany.

Furnace Sizes in Coke Oven Industry to Be Standardized

Since construction of hydrogenation and synthesis plants for the production of coal oil requires a long time, Germany has been studying possibilities for the expansion of light oil production by carbonization. The necessary increase of producing capacity in coke ovens and gasworks is to be achieved by use of standard sizes for new chamber furnaces.

Company Formed for Sale, Distribution of Liquid Gases

Propan G. m. b. H. has been formed by members of the propane syndicate to take over sale and distribution of liquid gases and derivatives, such as propane, butane, propylene, butylene, isobutane, and isobutylene. The main supply sources are the Fischer-Tropsch synthetic oil plants which produce 10 per cent of their entire output in the form of hydrocarbon gases. The new arrangement for distribution of liquid gases must be regarded as evidence of continued expansion in the German coal-oil industry, though the increasing shortage of steel containers for the transport of liquid gases (these containers have now been brought under the Chemical Control) also made new arrangements advisable. Smaller amounts of gases are obtained from carbonization plants. The gases are extracted by adsorption with activated carbon. If the mixture contains propane and butane in equal parts, it is used direct as a motor fuel. Otherwise the constituent gases must be separated and mixed in specified proportions. Liquid gases are claimed to show a number of advantages as a motor fuel, including quick start in cold weather, absence of smoke, smell, and soot, and absence of deposits on pistons, etc. Liquid gases are distributed to rural districts where there is no adequate supply of town gas to act as a substitute for lighting and cooking, but this new outlet seems unprofitable in most cases.

Coking Coal Supplies Extended by Mixtures

Only one third of the German coal production consists of coal suitable for use in coke ovens and gasworks. Most of this comes from fields in western Germany; the central and eastern regions have for some time suffered from a serious shortage of coking coal. Experiments to overcome this shortage show that the supply of rich coking coals can be increased if use is made of coals with similar properties and their deficiencies are made good by mixture with coals deficient in other respects. Coals of recent formation which are similar to gas coal can be made to yield a good coke if the plasticity is diminished by addition of fine coking coal or coke dust. Compensating grades of coal need not be present in the mixture in proportionate quantities. Comparatively small additions are claimed to have resulted in appreciable improvement of inferior coals. However, great attention must be paid to continuity of supply of coal mixtures in suitable quality, and a special committee has been formed to lay down rules for grinding and blending coals for use in coke ovens and gasworks.

By-Product Recovery Process Saves Construction Material

The increase in the long-distance distribution of compressed gas in Germany has led to a simplified process of gas purification and by-product recovery under pressure. The savings in construction materials is estimated at 1,000,000 marks for a plant with a daily output of 2,000 tons of coke. In a plant installed at the coke-oven works Hansa, the gas reaches the compressor direct from the precooling and ammonia plant. While the gas which is retained in the plant for heating is passed from the ammonia washer to the benzene washer, exhauster, and storage tank, the gas destined for long-distance distribution is going from the compressor to the naphthalene washer, benzene washer, purification and drying plant. Since it is in a compressed state all these installations must be built of stronger material, but the increased cost is insignificant compared with savings in plant capacity. As the gas is compressed, the contents of benzene, sulfur, naphthalene, etc., are correspondingly larger per volume, so that these substances can be recovered more easily and completely.

Francolor Takes French Raw and Finished Dyestuffs Stocks

Francolor, the new French dyestuffs combine in which I. G. Farbenindustrie holds 51 per cent of all shares and the three French dyestuffs producers share in the remaining, has taken over all stocks of raw materials and finished products in the French dyestuffs factories. The raw materials have been bought for the prices at which they were originally acquired by the present holders, while the finished products have been valued at the cost prices of the first six months of 1939 plus 13.5 per cent premium, transport, and insurance. At the same time French dyestuffs prices have been raised by another 25 per cent and are now 41 per cent above 1939 prices. A list of patents handed over by I. G. Farbenindustrie to Francolor has been issued. It is reported that I. G. Farbenindustrie has financial interest in Société Alsacienne des Produits Chimiques, Mulhouse, Alsace, a subsidiary of which is St. Clair, one of the three French dyestuffs producers.

France's Light Metal Industry Increases Capital

Increasing operations in the French light metal industry are reflected by several recent capital transactions. L'Aluminium Français has raised its capital from 30,000,000 to 100,000,000 francs and Société de Duralumin from 63,000,000 to 126,000,000 francs. Péchiney has issued new debentures to the extent of 340,000,000 francs.

Shale, Sulfur to Be Mined in Southeastern France

Société Languedocienne de Recherches des Exploitations Minéures, a subsidiary of Potasse et Engrais Chimiques, equipped with a capital of 55,000,000 francs, has received a license for exploitation of sulfur and shale deposits north of Narbonne in southeastern France. The concession extends over 5,000 acres, and mechanical baggers have been ordered for large-scale production.

Plants for Synthetic Fuel Oil Proposed for France

French motor fuel policy during the past 12 months aimed at maintaining a minimum production of substitute fuels from various sources at a level consistent with essential demands. During the current year it is hoped to expand output substantially by extension of the shale oil factory at Autun, ultimately to produce 2,500 tons daily. Two plants for treatment of lignite are to be constructed in the Departments of Bouches du Rhône and Landes, and an annual output of 50,000 tons is anticipated but unlikely to be realized before 1945. A pilot plant for manufacture of synthetic oil is operating at St. Hilaire, and a commercial plant will be built there. Considerable additions to the French motor fuel supply are also expected from extension of the use of gas generators, while 60 per cent of the demand for lubricants is to be covered by domestic materials.

Vanadium to Be Recovered from Oil Residues and Bauxite

The growing shortage of alloy metals has caused A. M. M. I., the semiofficial company for promotion of mining in Italy, to develop a scheme for construction of a plant to recover vanadium from oil residues. Vanadium traces are also found in bauxite, and this source is to be utilized.

Grapeseed Oil Used as Linseed Oil Substitute

Progress has been made in Italy with the extraction of grapeseed oil. This is carried out with gasoline ether and, on a larger scale, in plants for the treatment of olive residues with carbon disulfide. It is stated that 9 to 10 per cent of the weight of dried seeds can be recovered. Grapeseed oil is used in the place of linseed oil, and its high viscosity is claimed as a special advantage. The industry is also to be introduced into Serbia.

Castor Oil Substitutes for Tung Oil in Hungary

Castor oil is used extensively in various parts of the European Continent as a substitute for tung oil. Castor oil is dehydrated and generally subjected to other treatment, and in Hungary the plant is cultivated on more than 20,000 acres. It is also used as a plasticizer in the lacquer industry and for alkyd resins. Saponified pure castor oil finds an outlet in the manufacture of stearin ointment.

Hungary Plans Extensions in Aluminum Industry

Ungarische Bauxitgruben A.-G., a company formed five years ago with a capital of 2,000,000 pengö, has raised its share capital from 10,500,000 to 16,800,000 pengö for the financing of plant extensions. The company intends to build an alumina plant capable of an annual output of 20,000 tons and an aluminum plant for 10,000 tons yearly. Bauxite production was increased by half in 1941, but the additional supply was sent to Germany. No date has been set for completion of the extension work; payments in advance on construction are shown in the balance sheet as 17,150,000 pengö.

Insulin Production to Be Increased in Sweden

Of an annual consumption of 245,000,000 units of insulin, 165,000,000 units were hitherto covered by the factory of Apoteksvarucentralen Vitrum, while the remainder was imported, mainly from Denmark. Difficulties in imports have led to plans for careful collection of pancreatic glands in all big slaughtering yards. The material will be used in existing factories to fill the entire local demand.

By-Product Metals to Be Recovered from Oil Shale

Expansion of shale oil production at Närke has made possible execution of plans for the recovery of vanadium, molybdenum, tungsten, cobalt, nickel, and uranium—all found in traces in the shale. A sulfur plant will soon be built at Kvarntorp to utilize the sulfur residue available from the oil refinery. Output is expected to be large enough to replace all imported sulfur.

New Oxygen Factory to Begin Operations in August

Nordiska Syrgasverken A.-G. are building an oxygen factory at Kneippbaden near Norrköping which will begin operations in August. The existing factory at Motala is no longer able to meet the entire demand.

Swedish Government Forms Control Company for Cellulose Industry

The Swedish Government has formed the A. B. Statens Skogsindustrier to exercise control over the state-owned sawmills, cellulose factories, and distillation plants. The more important are the cellulose factory at Karlsborg and the distillation plant at Pitea.

Nitrogenous Fertilizers from Lignite of Southern Italy

A. L. I. and Vetrocoke have developed plans to utilize lignite deposits found at Mercore in southern Italy for the production of ammonia and nitrogenous fertilizers.

Methane Gas Used as Railway Fuel in Italy

Italian methane gas production amounted to 5,000,000 cubic meters a month at the end of 1941, according to Silvio Gai, president of the Methane Gas Corp. Seven hundred thousand

cubic meters are used for technical purposes. A new big outlet for methane gas compressed to 300 atmospheres overpressure has been found in railway operations. The first methane gas-fed railway engine, of 120 horsepower, is being used on the route from Rovigo to Chioggia (Venice), and more methane gas locomotives will be put into operation.

March 26, 1942

Sweden Extends Its Physical-Chemical Research for Substitutes

EXTENSIVE research is going on in all fields in Sweden to find substitutes for products which can no longer be imported, the Swedish-International Press Bureau, Stockholm, reports. One of the most important centers for this work is the physical-chemical institution of Uppsala, headed by the famous Swedish scientist and Nobel Prize winner, The Svedberg.

A recent article in the Stockholm paper *Dagens Nyheter* gives glimpses of the present work at this institution which, in addition to Professor Svedberg, has among its co-workers several other of Sweden's foremost scientists. The institution has lost all foreign investigators who used to study there, with the exception of one Swiss, but nevertheless the staff has been doubled. Extensions have been made particularly in departments dealing with the many current supply problems.

The work with different kinds of synthetic resins and cellulose derivatives is progressing on a large scale. Experiments are being made on finding some way to replace imported hard wheat, formerly used to improve the baking qualities of bread made from native Swedish soft wheat. Investigations on synthetic rubber have proceeded so far that the product has been evolved in the laboratories of the institute, although it is too early yet to predict whether domestic production can be started. The raw material is acetylene, i. e., calcium carbide, and the experiments have been conducted independent of the mass of available formulas, patent descriptions, and literature on the subject.

One of the foremost technical means of assistance is the Svedberg ultracentrifuge. The rotor of this centrifuge is given a speed of up to 70,000 revolutions per minute by a number of oil turbines. The institution also houses such famous instruments for research as one of the world's most gigantic electromagnets and a neutron generator, an atom cannon for hydrogen-gas radiation, both Swedish-constructed instruments. In the biochemical section the experiments for locating and cultivating infantile paralysis virus and tuberculin, on the basis of a new method for analyzing mixtures through molecule splitting, are carried on under the direction of a well-known Swedish scientist, Arne Tiselius, who devised this procedure. The prime object is preparation of a pure form of virus. Stoppage of import of apes for these experiments for a while threatened the researches with loss of indispensable test animals, but it is said that replacement with rats has proved acceptable.

Disruption of the earlier lively connections with American research institutes, engaged on the same problems, has been a serious disadvantage to the Swedish institute, but in spite of all difficulties the scientists are carrying on energetic and successful research on old and new problems.

German Products Dominate Market for Drugs in Bolivia

AMERICAN exporters' neglect of the Bolivian market for drugs and pharmaceuticals has resulted in German products dominating the market, not only in normal years but even since the outbreak of war. Large inventories were stocked by dealers there, according to the U. S. Department of Commerce.

The general lack of interest in the Bolivian market which is being shown by exporters of drugs and pharmaceutical supplies is encouraging continued purchases of German products of this nature, a report warned.

Supplies in Bolivia of German drugs and pharmaceutical products have been adequate to supply the market ever since the war began, it was added. In some cases these supplies have been known to have been transported from Germany via Lati, the former European-dominated air service in Latin American countries, and in other cases shipments have been made from factories in Argentina and Chile.

Products of certain German firms are so well known in Bolivia, it was pointed out, that in most cases practicing physicians in Bolivia prescribe them. As long as no American products replace them or compete, it is feared, purchases of German products of this kind will continue provided supplies are available from that country.

Chilean Importance as U. S. Supplier Increases

CHILE has recently assumed an important position as a supplier of argols and wine lees to the United States, according to the U. S. Department of Commerce. The country also furnishes quantities of calcium tartrate to the United States.

Although Chile formerly imported from 15 to 20 per cent of its tartaric acid supply from the United States, the country now produces so much that during the first nine months of the past year no imports were taken at all. This compares with 1940 when 3,000 pounds were imported and 1939 which saw imports of 23,000 pounds.

Switzerland Cuts into Already Reduced Rations of Soap

DRASTIC rationing of collective consumers of soap and cleaning materials have been put in effect in Switzerland by the War Industries and Labor Office, tightening restrictions already in operation on production, rationing, and use of soap and all kinds of cleaning materials. The first quarter of the present year finds government offices, office buildings, boarding houses, cafes, etc., receiving 20 to 30 per cent of the amount used in 1938 and 1940. Hotels, restaurants, factories producing foodstuffs, and pharmacies are limited to 30 to 50 per cent of the former consumption, and hospitals, physicians, dentists, and similar users will be allowed the maximum, 80 per cent of 1940 consumption.

India's Chemical Expansion Program Is Well under Way

CONTINUED expansion of the chemical industry of India was noted by the U. S. Department of Commerce in analyzing reports from that country for the past year.

The chairman of Tata Chemicals, Ltd., a large chemical producing corporation, recently reported that most of the machinery and other equipment needed for the expansion program under way already was in hand from United States and United Kingdom plants, with the remainder en route or scheduled for early delivery.

Increased financing was stressed by firm officials as the need of the moment, due to rising costs of labor, raw materials, freight, and equipment.

Copper Sulfate Imports by Argentina Increase

COPPER sulfate, largely originating in the United States and United Kingdom, has been imported in increasingly larger amounts by the Argentine, as indicated by imports into that country of 5,200,000 pounds in the first nine months of 1941 compared to the average yearly figure of 3,700,000 pounds between 1936 and 1940. Increased purchases are attributed to stoppage of domestic production in 1940 and a desire to accumulate reserve stocks against any sudden appearance of plant diseases and insects.

Uruguay Stops Exports of Tartar, Tartrates, Wine Lees

EXPORTATION of tartar, tartrates, and dried lees has been completely stopped by a decree of the Government of Uruguay. Uruguay has made small quantities of tartaric acid for some years but not enough to supply the domestic demand. Annual imports amounting to 138,000 pounds each year were necessary between 1937 and 1939.

Peruvian Industries Constitute Fairly Large Soda Ash Market

A NUMBER of Peruvian industries constitute a rather large market for soda ash according to the U. S. Department of Commerce. Glass factories, mining companies, washing soda manufacturers, cotton mills, sugar refineries, wool mills, and a number of smaller industries form the largest manufacturing consumers.

The United States and the United Kingdom have been the leading suppliers of soda ash in this market for some years. Imports by Peru of this commodity were 1,955 metric tons in 1936, dropped to 1,817 in 1937, but rose to 2,542 metric tons the following year. They were 3,277 metric tons in 1939, dropping to 2,919 in 1940, and for the first nine months alone of 1941 gaining to 3,112 tons.

Canada Rules Use of Synthetic Vitamins in Bread Adulteration

CANADA has adopted regulations which stipulate that the use of synthetic vitamins in the manufacture of flour or bread for sale for consumption in that country is expressly an adulteration of food. The new Order-in-Council under this heading prescribes standards for flour and bread containing a high proportion of vitamin B complex naturally occurring in the original wheat. Except for such flour or bread, it is stated, labels or descriptions using the word "vitamin" or any other word, symbol, or device suggestive of any vitamin shall not be used as a part of the name or in immediate conjunction with the name. These regulations became effective April 1 for flour and will go in to effect April 15 for bread.

U. S. Prime Shipper of Peru's Expanding Imports of Borax

EXPANDING imports of borax by Peru in the past few years are reported by the U. S. Department of Commerce. These imports have ranged from 19 metric tons in 1936 to 32 in 1937, 28 in 1939, 43 in 1940, and for the first nine months of 1941, 42 tons. Larger demands from the principal users, gold mining companies and the Peruvian glass industry, are said to account for increasing imports. The United States has been the leading shipper since 1940. Up to that time this country shared the market with the United Kingdom, with the latter selling the major part.

Guatemala's Sole Source of Naphthalene Is U. S.

SINCE 1940 the United States has become the sole source of naphthalene for Guatemala, where formerly this country shared the market with the United Kingdom and Germany. Imports by Guatemala during 1937–41 averaged 2,450 pounds annually. Pharmacists are the principal importers, selling naphthalene to the public for insecticidal and medicinal or laboratory uses.

Guatemalan Sulfuric Acid Imports Come from U. S.

ALL the sulfuric acid imported by Guatemala has come from the United States since 1941. Imports between 1937 and 1941 averaged 10,700 pounds annually, with considerable amounts coming from Germany during 1937–39. Some local production is reported but imports are essential, according to the U. S. Department of Commerce. Guatemala uses the acid for tanning, in manufacture of batteries and pharmaceuticals, and in garages and the textile industries.

Agriculture of Palestine Awaits Shipments of Ammonium Sulfate

ANTICIPATED arrivals of ammonium sulfate shipments from abroad are expected to help Palestine's agricultural situation, reported to have suffered during the latter part of the past year from the shortage of chemical fertilizers prevailing in parts of the world dependent on imported quantities of this product.

The government is said to be supporting a new enterprise for producing superphosphates locally, using sulfuric acid from the oil refinery and phosphate from Trans-Jordan. This production is estimated as sufficient for the country's needs.

New Zealand Amends Food and Drug Sale Regulations

UNDER a recent amendment to New Zealand's Food and Drug Sale Regulations, lactic or phosphoric acid to a limited degree may substitute for tartaric or citric acid. A regulation provides that citric or tartaric acid may be used in preparation of any food, and that not more than 50 per cent of citric or tartaric acid may be replaced by an equivalent quantity of lactic or phosphoric acid.

Britain's Bone Salvage Campaign Successful

GREAT BRITAIN'S salvage campaign for bones has amounted to a value of £54,000 since it was launched in November 1939. Household bones are considered particularly valuable, being adapted to complete use in a number of commodities—glycerol, fertilizers, glue, and feeding stuffs. Large collections of organic fertilizers also have been reported.

COSTA RICAN imports of other than United States origin in the last quarter of 1941 included potassium chlorate, antimony sulfate, zinc oxide, phosphorus, and sulfur from Mexico, all in relatively small quantities.

Imports of Methanol from U. S. to Argentina Fluctuate

THE United States is virtually the only source for imports by Argentina of methanol, since there is no domestic output, according to a trade survey. These imports fluctuate, but in recent years have been generally upward. Only 9,000 pounds were imported in 1934 and the following year 30,300 pounds, declining in 1936 to 18,500 pounds. Average annual imports in 1936–40 amounted to 63,900 pounds. Total imports in 1940 were 107,200, and the first half of 1941 saw 19,600 pounds brought in.

Belgian Congo Mining Industry Increases Use of Explosives

THE mining industry of the Belgian Congo uses explosives in quantity, which are both imported and produced locally. Domestic output in 1939 amounted to 457 tons, according to official figures from the Belgian Congo. Direct exports of this product from the Union of South Africa to that section of the Congo were valued at £3,400 in 1940, compared with only £202 in 1938.

Ecuador's Imports of Sodium Hydroxide High

WHILE statistics on Ecuador's imports of sodium hydroxide in 1941 have not been furnished, official observers anticipate that these have greatly exceeded the 431 metric tons imported in 1940. This is interesting to the American trade since this country, with Great Britain, has furnished the bulk of Ecuador's sodium hydroxide requirements, except for the period 1937–39 when Germany participated to a small extent.

The reason the 1941 figure is expected to be so high is that most sodium hydroxide consumed in Ecuador is required by soap manufacturers, the textile industry, petroleum, sugar, and edible oil refineries, in several of which demand has greatly increased. Smaller amounts are needed for disinfectants and for some laboratory and pharmaceutical use. Only minor quantities are produced locally.

Eire Forms Company to Exploit Mineral Resources

FORMATION by the Government of Eire of a Mineral Exploration and Development Co. is attributed to a shortage of fertilizers in that country and the need for exploiting any mineral resources which can be located. Lack of raw materials, according to a recent report, may force the closing of a chemical fertilizer factory at Dublin. The company depends on imported phosphate rock and pyrites as well as ammonium sulfate from Great Britain. Latter shipments ceased on January 1, 1941, with the other items no longer obtainable.

Patent Laws in Our Social Scheme[1]

NELSON LITTELL
22 East 40th St., New York, N. Y.

RECENT criticisms of the use of patents seem to indicate that speaking on patent laws in our social scheme is an attempt to justify something inherently evil. Critics of the patent system have been loud in their condemnation of alleged specific abuses without presenting to the public a fundamental view, or even a true picture, of the value of the patent laws to the progress of mankind. They have turned from fundamentals and taken a few isolated spots from which to portray an alleged evil of the system as a whole.

Today we are fighting to preserve democracy and our American way of life and, if we permit reformers and publicity seekers to blind us to fundamentals, we will have lost rather than preserved that for which we are fighting.

This does not mean that a patent holder is justified in any way in delaying our war effort. It does mean that he is as justified in insisting that his patent rights be recognized after the war is over as the man or corporation who has a plant or any other property devoted to war work is justified and correct in insisting that, when the war is over, he is entitled to use his plant to produce goods for profit in a normal peacetime economy under the capitalistic system.

To gain appreciation of the fundamental position of patent laws in our social scheme, let us review briefly the effect of the recognition of property rights on the progress of mankind. Imagine a wholly unorganized society in which the individual's right of possession is recognized only in that individual's ability to protect and defend his possessions. In such a state of society—a state bordering on savagery—even the hardiest individual could accumulate and defend only a very limited amount of property. Whether we visualize him as accumulating and hoarding coconuts or sugar, as soon as his hoard becomes known the other members of the tribe turn on him. He is compelled to divy up, either by actual force or threat of force, and you have Communism or Socialism, or even state control if that name is preferable, but there is no progress toward the more abundant life for anybody. Only after society as a group unit began to recognize and itself protect the right of an individual in certain property was any perceptible progress made from savagery.

Probably the first form of property right recognized by society, as existing in the individual, was man's property right in his wife and children—his right to be protected by society in these possessions. That form of property right has undergone many transitions and it is doubtful if any man today would dare assert a property right in his wife, but we do still recognize in law the right of the man to compensation for the loss of the life of a wife or child or to compensation for services or loss of services of a wife or child in any injury case. That form of property right, except for its stabilizing effect on society and its incentive given man in other fields, has not been a direct contribution to the scientific progress of civilization. Indirectly its influence is incalculable.

The recognition by society of the individual's right of property in personal possessions acquired and improved upon by him and in real or land property marked the beginning of a path of progress which has been unending in the march of civilization. The individual brings forth nothing new from within himself in settling upon, improving, and cultivating a piece of land, which was already there for anybody to acquire. Nevertheless, when civilization began to recognize in the individual a property right, in real or personal property, which society itself would protect, it gave the individual the incentive and reward to cultivate, develop, and improve that property. He could plant, cultivate, and store crops with the assurance that, as long as he complied with the laws of the existing society, the crops would be his to tide him and his family through the winter season or over the rainy day. He could construct buildings for shelter and for storage, rude as they might be, with some assurance that society within its strength and ability would protect him in the possession of his acquisitions and in his improvement thereof. This beginning of the incentive to improve, one of the most important incentives in the progress of man, is laid squarely on the recognition by society of a property right in the individual. The greater these improvements, the greater the ultimate progress of the society.

Under this system over long years man made a slow and painful progress, sometimes with long periods of retrogression and with the vicissitudes of war between tribes or larger units of society playing their part in making life and possessions at all times uncertain. Society, however, in all of its successful forms was always dependent for ultimate progress on the recognition in the individual of certain forms of property rights which gave the individual the incentive to improve and develop the property society recognized as his.

Throughout the period of recorded history to the past 300 years, in the Egyptian, Greek, and Roman civilizations, and through the Middle Ages, man made some progress improving upon what he acquired from his society in the form of real or personal property and many times adding to it from his own ingenuity, but without any recognition by society that a man could have a property right in his original ideas or in his inventive improvements on existing things.

Then came the Statute of Monopolies passed in England in 1623 during the reign of James I. This was the first statutory recognition that society might and should recognize and protect a man in the development of his original ideas. This statute was forced through Parliament to curb the practice of the Crown of granting monopolies to court favorites on everyday commodities of life, such as salt, spices, playing cards, and the like. It prohibited the granting of all monopolies, *except those for new inventions and new importations into the Realm.* From the negative beginning of this statute, the patent laws of the entire world have sprung.

This statute and patent laws of the various countries have been interpreted as preventing monopolies on things which were already known in the society, but as authorizing the grant by the society of legal monopolies for a limited number of years on those inventions, discoveries, and improvements which spring from within the individual, add to the sum of knowledge, and give new utilities to society.

As long as the usual type of real and personal property rights only were recognized by society, man's incentive to improve was limited by what it was prudent to put into a new building, a new ship, or a new tool. He could not afford to spend hours and years improving existing structures, or thinking out new ideas for later development and improvement. He could not even afford to improve upon such machines as were then known because under the existing rules of society he had no protection on these new ideas or improvements. Anyone could copy and use them as soon as they were developed and became known. Much less could he afford to hire, house, and correlate the work of numerous researchers to discover and develop new things. Consequently,

[1] Address delivered before the Western Connecticut Section of the AMERICAN CHEMICAL SOCIETY, March 30, 1942.

during the early centuries of civilization and through the Middle Ages, men who developed or originated new processes practiced them in secret as much as possible, and many secrets died with the individual and were either temporarily or permanently lost to society.

It took about 100 years for the effect, or rather the impact, of the philosophy behind the patent laws to make itself felt on the progress of society. By 1725 the more intelligent individuals began to know that they would be protected in their inventions, discoveries, and improvements, and by the beginning of the 19th century, spread by folklore and the facts of a few outstanding inventions, every individual knew that his fortune might be made if he could bring forth an invention which would contribute to the progress of mankind. Every individual became a potential inventor and improver by virtue of the incentive held out by the patent laws.

The progress of mankind toward the more abundant and more enjoyable life since that time has been astounding. Lying at the root of all this progress was a simple and not too well understood act of society in recognizing a new type of property right in the individual—the right to be protected for a limited period of years in the exclusive enjoyment of his original ideas, when developed and improved into things useful to mankind.

Under this new form of property right, recognized by society, man could afford to work upon and develop his embryonic ideas into useful things and be protected in the enjoyment of the fruits of his improvements—the same as under the older forms of recognized property rights he could improve his buildings or his plot of ground, and know that the improvements were his.

The dates of some of the more outstanding inventions under the patent laws are: steam engine, 1765; coal gas for lighting, 1790; steamboat, 1793; screw propeller, 1804; phosphorus match, 1831; telegraph, 1832; vulcanized rubber, 1839; rotary printing press, 1846; motion picture machine, 1861; telephone, 1875; and talking machine, 1877. The electric light, radio, talking pictures, automobile, airplane, automatic refrigerator, and numerous other inventions vital to today's society have been produced since 1875. In that span of less than 70 years, within the memory of men still living, a miracle of progress has unfolded.

Almost all of the things which make our life easier, working day shorter, and home life and leisure more enjoyable have come to us in the past 100 years. When we compare the progress of this past 100 years with the progress of the 4,000 years preceding it and the comforts of today's existence with those of 100 years ago, we realize that society made a tremendous forward spurt during this past century. Few of us pause to consider that it is the patent system—the recognition of a new form of property right by society—which is the fountain from which all these improvements spring. Underlying all these inventions is the new incentive afforded by the patent laws to develop new things and improve upon them.

There is no reason for us to believe that the past 100 years have produced a race of superior intelligence or superior attainments. The men who built the horse used in the siege of Troy, the workmanship on the Roman galleys, the superiority of Damascus steel and Venetian glass, and various other things from antiquity indicate that workmen in those days were as able, capable, and skilled as workmen of today. They were, however, offered by their society no incentive to improve upon existing conditions and no way in which they could profit from original ideas and discoveries except through the secret process. There was no possibility of reward for bringing forth something new or improving upon something old.

When society at last recognized the desirability of offering some reward or incentive for bringing forth new ideas and for improving upon old ones, the rate of progress made by civilization has been astounding. Prior to 200 years ago, the world had made relatively little scientific progress in its many centuries of development. Since that date we have literally revolutionized the life pattern of civilized man.

Not all this progress was by outstanding leaps and bounds. Just as the recognition of property rights in real and personal property enabled the individual to improve his property with safety, the recognition of a property right in ideas and inventions made it possible for man to make improvements on existing inventions, and to risk his time and capital in so doing, with the reasonable expectation that the improvements would inure to his benefit.

Within our memory the telephone has been greatly improved. From what was originally regarded as a gadget or a toy, it has become a necessity for modern business and a comfort in home life. Its span of distance has been increased from a few yards to the distance around the earth.

Improvement of the radio since the days of crystal sets and earphones has step by step brought it to the point where almost instantly and clearly the happenings in the most remote part of the world can be heard. Improvements in the automobile within the past 25 years are familiar history. The airplane has been developed from a rickety flying crate into luxurious ocean transports and formidable fighting weapons, and the end of these improvements is not in sight. The improvements are as important and useful as the original inventions and sometimes more immediately valuable.

With all this progress attributable in a very large measure to the patent system, critics of the system would have us believe that it has outlived its usefulness and that improvements would continue to be forthcoming without the incentive of return offered by the system. Would we improve our homes or factories if our neighbors or the community could come over and take the improvement from us the moment it was completed? No more would we or our employers spend time and money to improve existing drugs, machines, products, or processes or to develop and produce new products, if those new things could be taken away the moment they are completed. We are not now talking of control and regulation of production during wartime, but of what may happen to one of our important property rights in peacetime if we permit these misconceptions and false premises to spread.

This philosophy that the patent laws have outlived their usefulness and that patents should not be sustained or, if sustained, should be confined to outstanding inventions has pervaded the news in recent years. It has been inculcated into the outlook of our courts to such an extent that, without change of our patent statutes, the patent system is being shorn of the attribute most useful to society—the patent on improvements.

In a recent decision of the United States Supreme Court, a patent on an improvement admittedly new and useful was held invalid because it failed to reveal that "flash of creative genius" which should pervade all outstanding inventions. If a "flash of creative genius" is necessary for a patentable invention, the telephone might qualify in retrospect, but what of all the important improvements which have followed that flash and have made the telephone from a toy in 1875 to the necessity it is today? Are they to be placed outside the scope of the patent laws?

The "flash of genius" theory would rule out nylon as an invention because it did not come from a single burst of inspired thought, but from several years of intelligently directed research. Nylon is, however, not merely a boon to America today as an outstanding invention, it removes our dependence on Japan for natural silk and as a peacetime development makes our transition to a war economy easier. It is one of the substitutes which industry provided when no amount of political foresight could have anticipated its crucial need.

Critics of the patent system would have the public believe that as a result of granting patent monopolies it is being unmercifully gouged by the large corporations, despite the fact that to sell a patented product today you must give the public something new or something better for its money than before. When nylon was placed on the market, it had to offer a better, a cheaper, or a superior product to the silk hose which preceded it; otherwise there would have been no public re-

ception and demand for it. What prevails as to nylon applies to the marketing of every other patented product or development. If the public is not offered something better, or cheaper, or both, it does not buy.

There is likewise an immediate gain to the public from the marketing of every patented invention. Even though the owner of the patent may make a long profit during the period of the monopoly, and there are many instances in which he does not, he must give the public a sufficient "break" when he puts his product out to make a market for it. When the patent expires, as it does after a limited period, the public gets the full "break" of a new and better product under open competitive conditions.

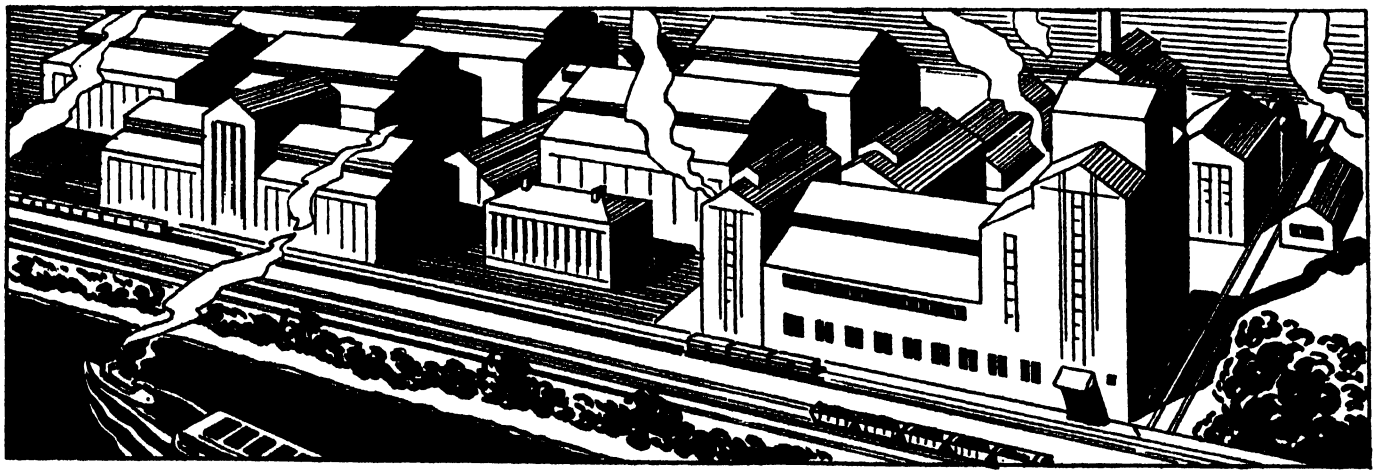
Certain critics of our patent system would also have us think that the international exchange of patent rights and information is an evil for this country. This is a customary part of any war hysteria, but the quickest way we have of getting information and important developments from other countries, whether Germany, France, England, or Czecho-Slovakia, is through the purchase or licensing of patent rights with the necessary know-how to put them into operation.

Our commercial processes of producing synthetic methanol came from Germany after the last war. The fixation of nitrogen, which makes us independent of the Chilean nitrate deposits, came from Germany and was brought to us via the patent system. In these days of shipping shortages and losses, we would indeed be hard put if we had to provide ocean tonnage to transport all of our nitrates from Chile. Had we had more of these developments, whether made in our own laboratories or acquired abroad, we would be less dependent today on foreign supplies of quinine, rubber, and the like.

The Bausch & Lomb Co. has been blazoned in all the headlines for an arrangement to secure manufacturing rights from a German concern on certain optical instruments of a military character, but the important thing is that we have the know-how and the facilities to manufacture these optical instruments in this country which, but for the criticized arrangement, might have been made today in Germany only.

Criticism of the Standard Oil Co. of New Jersey for its arrangements with the I. G. on synthetic rubber, made originally in 1929 when nobody contemplated a world-wide war, fails entirely to mention that but for this arrangement the manufacturing rights and the know-how on Buna rubber might not be in this country today. It certainly is better that we know how to make Buna rubber in this country, no matter what we gave in return, than to be entirely without it. The cost of the acquisition was certainly less than if we were forced to develop the entire manufacturing technique after our supplies of natural rubber were cut off.

We must not let the critics of our patent system confound and confuse us with charges which essentially beg the main question. Has the patent system contributed to the progress of mankind and is that contribution sufficient to warrant the continuance by society of the recognition of a property right in the individual sufficient to protect him in the development and improvement of his patentable ideas?



These things cannot be judged on a series of individual incidents or inventions, or on a survey of patents as affecting only four industries as in the T. N. E. C. hearings. The progress of mankind after the advent of patent laws must be viewed as a whole. While there are some entries on the debit side of the ledger, the credit side shows a handsome surplus for the society that created the patent right for inventions.

If the critics of our patent system have their way, the patent right will be restricted, regulated, and cut down by statute and court interpretation to such extent that the individual or corporation developing an invention will no longer be able to control it and to say where and how a competitor may come and use it. The international exchange of patent rights may be so fettered with governmental regulations that no one in peacetime will dare enter into an agreement with a foreign corporation for fear of being unfairly criticized for unpatriotic action, even though that action may bring this country more than is taken from it.

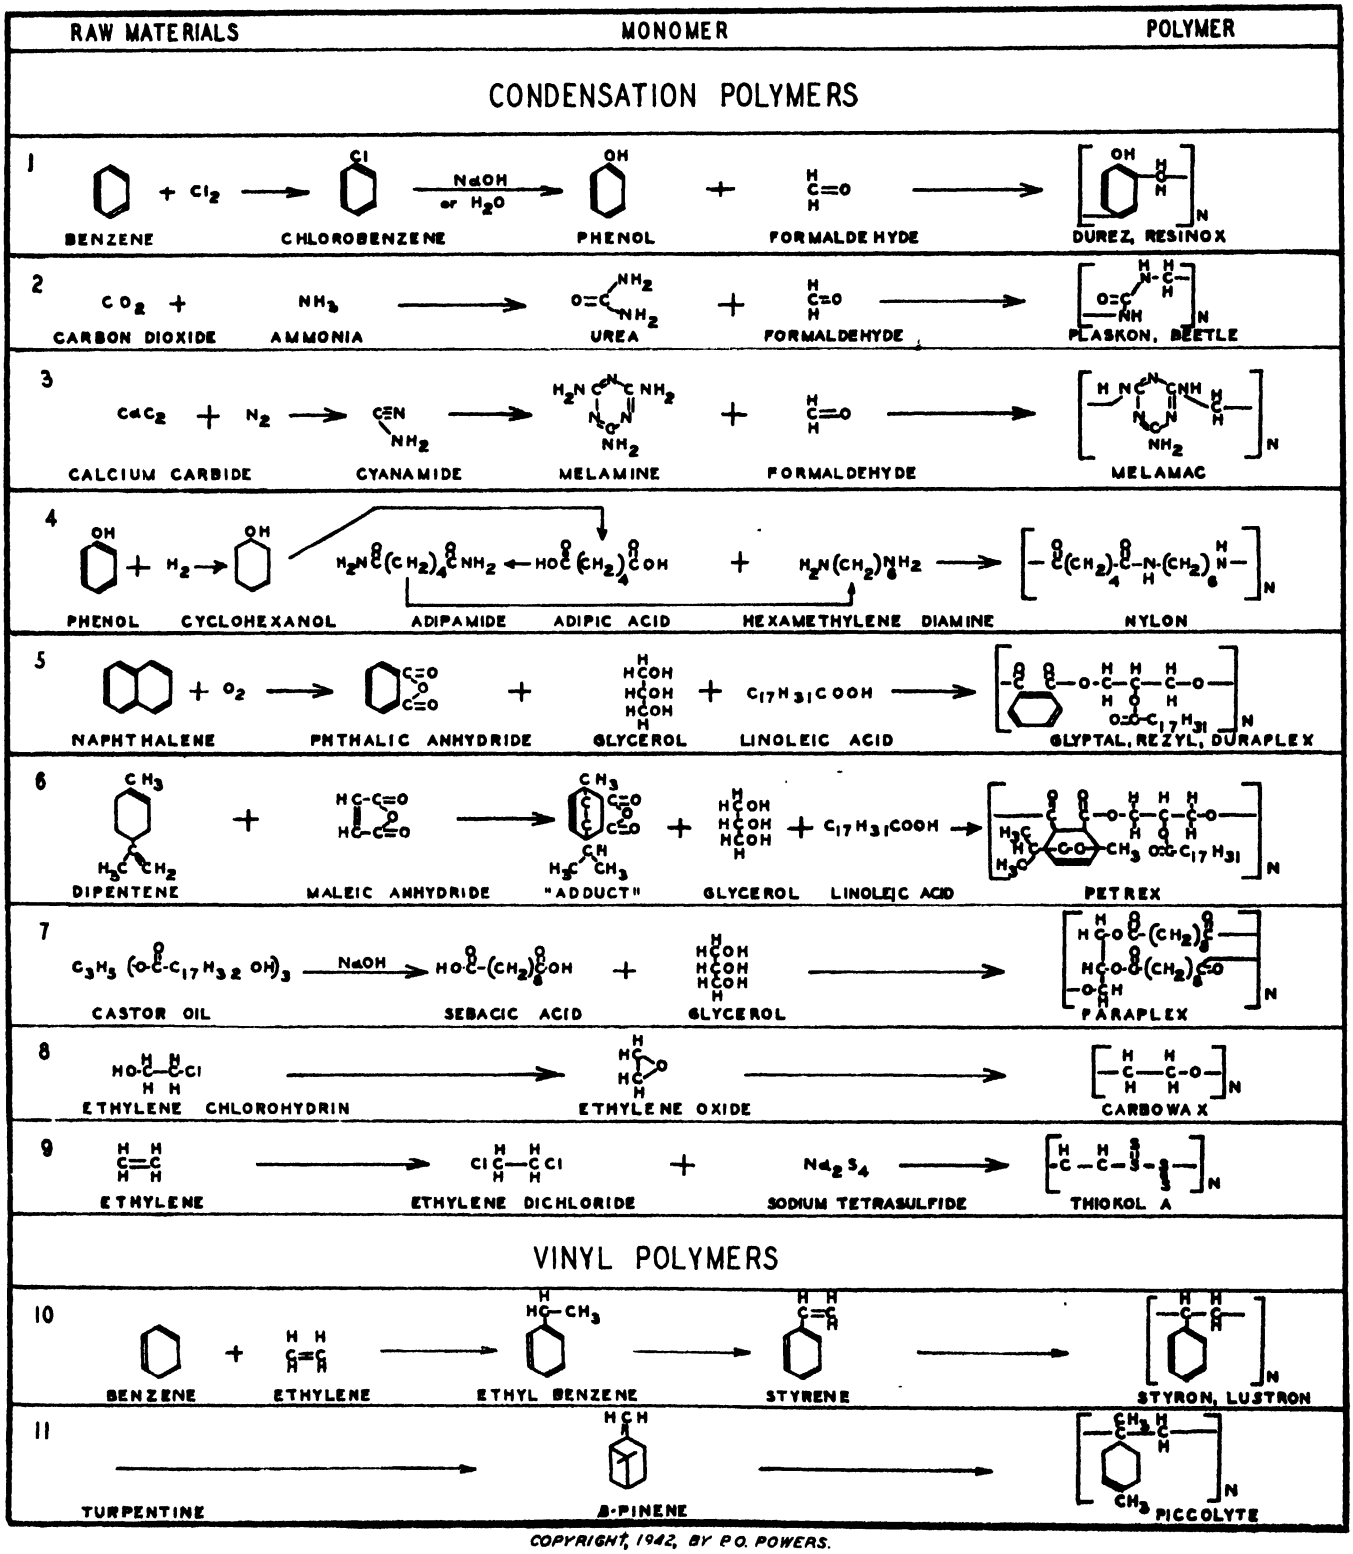
We must not let those things happen. In the aftermath of this war there will be more need for inventive developments than the world has ever witnessed—more need to encourage rather than discourage invention. The returning soldiers, as well as civilian employees released from war work, must be provided with employment, much of which must come from newly developed industries. The cry for cheaper housing to replace that which has been destroyed will tax man's ingenuity and will bring forth new and cheaper materials of construction and new and improved instruments for household comfort. The replacement of destroyed docks and sunken shipping, opening and efficient utilization of oil from blocked wells, reconstruction of destroyed refineries in the form of cheaper or more efficient units, conversion of the automobile industry from its all-out war effort to peacetime production, and many other problems will call for the exercise of man's best inventive efforts. These things will come at a time when the huge government expenditures for war materials will be cut off, and they must be provided by private capital and the efforts of individuals such as you and me to get back to a profitable peacetime business. It is up to us, while fighting for democracy, to see that the incentive for these improvements is not reduced or destroyed.

Potassium Permanganate Imports to Ecuador Drop

GERMANY was the principal source of potassium permanganate imported by Ecuador for use in pharmaceutical manufacture and in gold mining operations during 1937 and 1938. The decline in 1939 and 1940 of such imports may have been caused partly by suppression of German foreign trade by war. Imports averaged 4,000 pounds annually in 1937 and 1938.

Synthetic Resins and Synthetic Rubbers

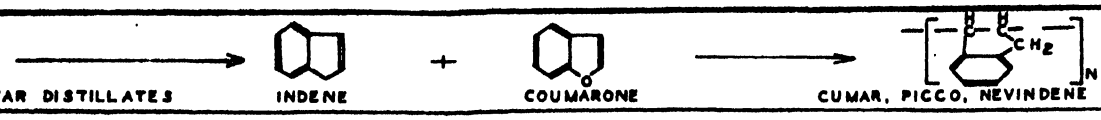
P. O. POWERS



Armstrong Cork Co., Lancaster, Penna.

This chart is a revision and extension of the chart published last year [NEWS EDITION (AM. CHEM. SOC.) 19, 750 (1941)]. Resins from natural products and several new synthetic resins have been added.

Some of the registered trade-marks or trade names designating the resins are listed. For brevity, no attempt has been made to include all of these nor company trade-marks ordinarily associated with more than one type of resin.



The formulas for the resins are necessarily abbreviated and may not always be entirely accurate. In some cases the formulas used have not been previously suggested.

All of the resins and rubbers in this chart are now produced in the United States in commercial quantities.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

THE objects of the Lexington Section of the AMERICAN CHEMICAL SOCIETY shall be: For the advancement of the science of chemistry through teaching and research, and to lend aid and hearty cooperation in helping carry on the work of the AMERICAN CHEMICAL SOCIETY (*cf.* the new constitution adopted April 6, 1927). These objectives have been rigidly adhered to since the section was organized in 1912, but it has endeavored to furnished a common meeting ground for all its members, both in the pure and applied branches of chemistry, where they can exchange ideas for the advancement, not only of the science, but of the individual and community as well.

The section has been organized so that this purpose can be accomplished most efficiently. Eight regular monthly meetings are held during the year from October to May except as otherwise ordered by the executive committee. This committee consists of the officers of the section—the chairman, first and second vice chairman, secretary-treasurer, and councilor. The executive committee handles all ordinary items of business, but such matters as the election of officers and amendments to the constitution are acted on by the section. This system allows the section members to devote more time to and take a greater interest in the technical and social part of the meetings and for discussion of the papers presented. The executive committee is organized in such a way that its duties are not burdensome. The chairman and first vice chairman act in an executive capacity, the second vice chairman as scribe writing up talks of the speakers and assisting the secretary in other ways.

Each meeting features a talk by some member of the AMERICAN CHEMICAL SOCIETY. Usually two or three speakers a year are members of the local section. The University of Kentucky chapter of Alpha Chi Sigma has for a number of years sponsored one meeting by furnishing the speaker and taking over the entire program. In recent years the section has affiliated with a number of sections through the Ohio Valley region to form a group called the Mid-West Cooperating Sections. This organization was founded to help each section of the group secure a visit of some nationally known speakers, experts in their field. The expense is small for each local section, and the speaker is able to complete a tour with a minimum of time and speak before a greater number of people.

The section maintains a membership committee whose duty it is to interest potential members in the organization and promote fellowship among members and prospective members. All advanced students are urged to become associate or junior members and to take part in local section affairs. The members of the section are drawn primarily from chemists in the educational field, though some come from the distillery and petroleum industries and the Kentucky State Highway Department. The Lexington Section has 57 members, most of whom are quite active and regular in attendance. A number drive 40 or more miles each month to attend the meetings.—MARTIN E. WEEKS, *Lexington Section.*

Richards Medal Awarded to F. G. Keyes

F. G. Keyes

THE Theodore William Richards Medal for 1942 has been awarded by the Northeastern Section of the AMERICAN CHEMICAL SOCIETY to Frederick G. Keyes, head

A. C. S. Student Membership Awards for 1942

DONOR	RECIPIENT
Alpha Beta Chapter of Alpha Chi Sigma Fraternity, University of Michigan. Annual award to the graduating senior with the highest scholastic average in chemistry or chemical engineering at the University of Michigan.	**Richard E. Field**
Bartow, Edward. Annual award to the outstanding graduate student in chemistry at The State University of Iowa. Includes subscriptions to the SOCIETY's three journals.	**Douglas S. Billington**
Baxter, Robert A. (13th annual award.) This is an award given to a senior on the basis of meritorious work in chemistry, calculated on the quality and quantity done in chemistry courses during the total attendance at the Colorado School of Mines.	**Willard M. Dow**
David Worth Dennis Award (established by Harrison E. Howe). Annual prize consisting of a membership for one year in the AMERICAN CHEMICAL SOCIETY and a subscription to one of the journals of the AMERICAN CHEMICAL SOCIETY to be given to a member of the senior class at Earlham College studying chemistry and meeting the requirements for the award.	**Robert H. Campbell**
Gamma Sigma Epsilon Fraternity. These memberships are awarded annually by the fraternity to the most outstanding student in each chapter.	
Alpha Alpha Chapter, Davidson College	**E. W. Larkin, Jr.**
Beta Alpha Chapter, University of Florida	**J. B. Redd**
Lambda Alpha Chapter, Mississippi State College for Women	**Laura Sue Ezell**
Lambda Beta Chapter, University of Mississippi	**John Thomas Abston, Jr.**
Zeta Alpha Chapter, Georgetown College	**Louis Jubanowsky, Jr.**
Ira D. Garard. These memberships are awarded annually to the highest ranking junior and senior students of chemistry at the New Jersey College for Women. (Miss McFarlane was the winner of the junior award last year.)	**Ruth E. McFarlane** **Elinor Hankins**
Theta Chi Delta Fraternity. This award is given through an essay contest sponsored by the fraternity. (Miss Gent, who is now doing graduate work at the University of Illinois, won this award while attending Carthage College.)	**Mary Gent**
Isabel Whelan Tibbitts. This award, consisting of membership in the AMERICAN CHEMICAL SOCIETY and a subscription to *Chemical Abstracts,* is made to the outstanding senior in chemistry at the College of St. Elizabeth.	**Kathryn J. Gunn**

A. C. S. Student Affiliate Awards

Centre College of Kentucky (Junior Award in Chemistry). This award, established by Nelson Allen in 1940, is given to the outstanding, highest ranking junior student majoring in chemistry and consists of student affiliation in the AMERICAN CHEMICAL SOCIETY and a subscription to *Industrial and Engineering Chemistry,* continued through the recipient's senior year.	Recipient for 1940: **Lewis K. Jones** Recipient for 1941: **Bryce McMullen**

of the Department of Chemistry and director of the Research Laboratory of Physical Chemistry at the Massachusetts Institute of Technology, for distinguished achievement in chemistry. Dr. Keyes has won international distinction for his work on the properties of steam under high pressure and for exact measurements of the physical properties of gases and binary mixtures.

This is the seventh award of the medal, which has been given previously to Theodore William Richards, Arthur A. Noyes, Gregory Paul Baxter, Charles A. Kraus, Gilbert N. Lewis, and Claude S. Hudson. It was established shortly after the death of Professor Richards in 1928 as a lasting memorial to his memory.

The Committee of Award is made up of Ernest H. Huntress, Walter L. Jennings, George B. Kistiakowsky, Arthur B. Lamb, Frank C. Whitmore, and George Scatchard, secretary.

General Aniline and Film Corp. Fellowship

The General Aniline and Film Corp. has established a $1,000 fellowship in organic chemistry at the University of Texas. Selection of the winning applicant will be made soon by a Committee of Award at the university.

Swift & Co. Fellowships in Nutrition

The University of California has received from Swift & Co., Chicago, a grant for the year 1942 to be used under the direction of H. J. Almquist in continuing his studies of the amino acid requirements of the chick. Dr. Almquist is well known for his work in poultry nutrition and has published a number of papers in the vitamin field, particularly on vitamin K. He has also contributed to the present knowledge of methods in evaluating protein quality. His most recent work shows that the chick has markedly different amino acid requirements from those of the white rat or other animals commonly studied. Dr. Almquist received his Ph.D. degree from the University of California, where he is now associate professor of poultry husbandry.

At the University of Georgia School of Medicine a Swift & Co. grant is to be used for investigations on vitamin deficiencies. The work, concerned especially with the depletion of biotin in human subjects and spontaneous avitaminosis, will continue on a larger scale research already in progress. Pathological effect, such as changes in the hemoglobin, cell volume, cholesterol and bile pigments in blood, excretion of biotin, and relation of excretion of vitamins to the intake, will be observed in the experimental subject. R. E. Butler of the U. S. Department of Public Health, Augusta, Ga., will have direct supervision during the absence of V. P. Sydenstricker, under whom the work was originally planned.

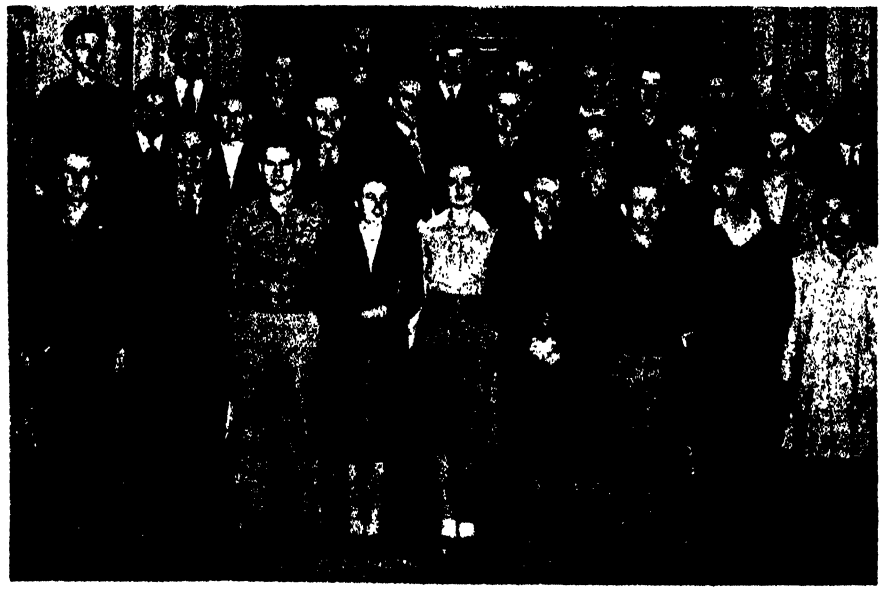
Hercules Powder Co. Establishes Fellowship

Hercules Powder Co. has established the Pine Chemicals Fellowship at Mellon Institute of Industrial Research at the University of Pittsburgh for the year 1942, with George B. Feild of the institute as fellow.

The purpose of the fellowship is to develop new uses for rosins, and to emphasize applications of these materials in the war effort. The fellowship continues the company's policy of expanding the uses of naval stores products, turpentine, pine oil, and rosin, and the products which may be derived therefrom.

In recent years the company's chemical research program in naval stores has been carried beyond the direct utilization of naval stores products to the development of chemical materials from these products. Hercules manufactures naval stores products only by the wood process, the distillation of pine wood, and extraction of naval stores by means of solvents. Gum naval stores, however, which are produced by tapping the pine trees and draining the sap from them, have also been included in the research program as possible sources of chemical products. Research carried on under the fellowship will be concerned with both wood and gum naval stores products.

Allied Chemical Continues Fellowships



The Allied Chemical & Dye Corp., New York, announces continuation of its graduate fellowship plan in the academic year 1942–43. The company feels that encouragement of advanced training in chemistry and chemical engineering through aid to outstanding graduate students is of even greater importance now than in peacetime because of the service which highly trained chemists and chemical engineers can render in the war effort. Recipients of the fellowships and the subjects are chosen by the universities, and subjects are not restricted to those connected with the products or interests of Allied's operating divisions and subsidiaries. Stipend of each fellowship is $750.

Universities and colleges to which awards have been made for 1942–43 are University of California, California Institute of Technology, Columbia University, Cornell University, Harvard University, University of Illinois, State University of Iowa, Massachusetts Institute of Technology, University of Michigan, University of Minnesota, Northwestern University, Ohio State University, University of Pennsylvania, Pennsylvania State College, Princeton University, Purdue University, University of Wisconsin, and Yale University.

Labeling of Chemical Containers

A recent incident in the laboratory of a large manufacturing company emphasizes the necessity of testing even simple chemicals before using. With the rapid expansion in the personnel of chemical plants, errors will inevitably be made.

A cylinder of compressed gas labeled as carbon dioxide and painted with the conventional color of carbon dioxide cylinders, purchased from a long-established chemical supply company, was found to be filled with ethane. Fortunately, the flammability of the gas was tested before it was used and a possible serious accident was avoided.

POTOMAC POSTSCRIPTS

WPB Activities

Construction. WPB has halted nonessential construction. Effective April 9, Conservation Order L-41 prohibits the start of unauthorized construction projects which use material and construction equipment needed in the war effort. It places all new publicly and privately financed construction under rigid control, except for certain strictly limited categories. Many of the same materials, such as iron, steel, and copper, are used by both essential and nonessential construction, and the same materials are largely used for war production. The order, in effect, allocates these materials away from unnecessary construction into ships, planes, tanks, guns, defense housing, and other essential production.

This step goes much further than the SPAB policy announced October 9, 1941, in which it was made clear that no priority assistance would be given to nonessential construction. The WPB order, however, provides that no construction may be started, except in a few specified cases, without permission.

Equally binding upon property owners, builders, and suppliers, the order prohibits not only the start of construction in most categories, but also the withdrawal from inventory and the purchase, sale, or delivery of any material for use in such construction unless expressly authorized by WPB. No residential construction except for maintenance and repair work may be started without permission if its estimated cost is $500 or more. Similarly, no new agricultural construction may be started if the estimated cost is $1,000 or more for the particular building or project involved. No other construction, including commercial, industrial, recreational, institutional, highway, roadway, subsurface, and utilities construction may be initiated without permission if the cost amounts to $5,000 or more.

Specific types of construction exempt from provisions of the order include:

Projects which will be the property of the Army, Navy, Coast Guard, Maritime Commission, and certain other listed agencies of the Federal Government.

Projects to reconstruct or restore residential property damaged or destroyed on or after January 1, 1942, by fire, flood, tornado, earthquake, or the public enemy.

Projects of the type restricted or controlled by provisions of the orders of the M-68 series, which cover the production and distribution of petroleum.

The order does not affect ordinary maintenance and repair work to return a structure to sound working condition without a change of design.

Enamel Coatings. To save scarce materials such as tung oil, resins, and solvents, Conservation Order M-116 limits the use of enamel coatings for glass container tops. The order prohibits further use of enamel coating on the exterior surfaces of tinplate or terneplate closures for glass containers, subject to certain exceptions. Reduction of the weight of the interior and exterior enamel coating on all closures for glass containers to not more than nine tenths of the standard weight in 1940, wherever practicable, is also directed.

WPB officials expect that through the order approximately 1,500,000 pounds of scarce protective coating raw materials will be conserved. These materials include tung oil, phthalic anhydride resins, phenolic resins, and certain solvents. Manufacturers will be allowed to coat container closures with enamel when required to protect lithographed printing, if other means of designation on the container closure are impracticable, or where the closures are heat-sterilized for use with food products for human consumption.

Glycerol. All deliveries of glycerol in excess of 50 pounds a month have been placed under allocation control. The allocations will become effective May 1. Deliveries for war orders and for manufacture of health supplies are exempted from the provisions of this General Preference Order M-58. Use of glycerol for manufacture of antifreeze is prohibited, and other users are limited to 70 per cent per month of their average monthly consumption in 1940. Inventories are restricted to one twelfth of the amount used and sold during 1940.

Users of glycerol must file a copy of Form PD-362 with suppliers monthly and the original with WPB. Refiners and producers must report on Form PD-363. All consumers who used more than 50 pounds in any one month for the six months ending March 31 must report before May 1 to the War Production Board on Form PD-361.

Methyl Alcohol. According to Amendment 4, designed to facilitate the operation of General Preference Order M-31, shipments of methyl alcohol to be used in the manufacture of formaldehyde for uses in Classification I of Order M-25, largely industrial uses, are granted a preference rating of B-2. Shipments for uses in Classification II, largely plastics for civilian use, are given a rating of B-3. Both classifications formerly received the same rating of B-3 for deliveries of methyl alcohol. Persons who require less than 55 gallons of methyl alcohol a month are exempted from the restrictions and requirements.

Priority Diversion. As the first step in an investigation of reported diversions in New York markets of chemicals purchased with priority assistance, WPB has ordered the Acme Chemical Co. and its subsidiary, the Rona Chemical Co., both of New York, to make no further sales or disposition of acetic anhydride or salicylic acid. The Acme Chemical Co. obtained large quantities of these scarce materials with priority assistance extended under the Health Supplies Rating Plan upon representation that they were for the manufacture of aspirin. Preliminary investigation by the WPB Compliance Branch indicates that the chemicals were not used for the production of aspirin, but were resold for profit.

Quinine. To build a stock pile for military needs, control has been established over supply and distribution of quinine. The regulation, Conservation Order M-131, affects all pharmaceutical and medicinal chemical companies, botanical supply houses, wholesale drug and supply houses, retail drug stores, and all other persons who deal in quinine—except the ultimate consumer. Terms of the order permit sale and delivery of quinine only for use as an antimalarial agent or an ingredient of quinine and urea hydrochloride. The restriction does not apply to any stock of quinine in combination with any other medicinal ingredient. Persons owning or having control of 50 pounds of cinchona bark or 50 ounces of quinine must report such stocks to WPB on form PD-401.

Ninety-five per cent of cinchona bark comes from Java. The Government has built a substantial stock pile and, in addition, there is available a large supply in the hands of manufacturers and distributors.

Estimated military requirements for the balance of this year will exceed the production expected to be obtained from South American sources. These sources, however, are being exploited as far as possible and at least fair amounts are expected to be received from South America this year.

Price Regulations

Lithopone. Redefinition of lithopone is contained in Amendment 2 to Revised Price Schedule 80. The new definition makes it clear that the name "lithopone" includes pure zinc sulfide, excepting chemically pure zinc sulfide and fluorescent zinc sulfide. These two latter grades are used, respectively, as a laboratory reagent and in the manufacture of fluorescent lamps. Their production is high-cost and represents only approximately 1 per cent of the total output of zinc sulfide.

Oxalic Acid. The reagent grade, used in comparatively small quantities in laboratory work, is exempted from provisions of the maximum price schedule by Amendment 1 to Revised Price Schedule 78 for oxalic acid. The amendment redefines the product put under a price ceiling by the Office of Price Administration. "Oxalic acid" means crystalline and powdered oxalic acid of technical grade. Reagent grade of oxalic acid is produced by refining the technical grade. The resultant grade is used in making analytical determinations in chemical laboratories. The process of purification involves additional cost. OPA has determined that prices higher than those charged for the less pure grade must be permitted in order not to discourage production of the grade essential to laboratory work.

Paraffin Wax. The additional cost of shipping paraffin wax in cotton bags, above the cost of burlap bags customarily used when Revised Price Schedule 42 for paraffin wax was issued on November 21, 1941, may be added to maximum prices. Under Revised Price Schedule 42, maximum prices for various grades of paraffin wax were established for shipments in tank cars, barrels, and bags. Another section of the schedule provided for maximum prices when shipments were in "other containers". In response to an industry query, OPA explained that the term "bags" as used in the schedule referred to burlap bags.

Electric Power Use in Canada May be Cut

CURTAILMENT of nonwar uses of electric power may be necessary in Canada late in 1942 as a result of war industries being established there, William L. Batt, chairman, U. S.–Canada Materials Coordinating Committee, has announced after a conference with Canadian officials.

The time or extent of this possible curtailment, however, is uncertain. The ruling factor will be water fall in Canada. Low water may bring drastic curtailment, and plenty of water would reduce it to a minimum. Such a curtailment would affect United States supplies of newsprint, as this industry is one of Canada's largest users of electric power. Stocks of newsprint in the United States, however, are at a high level. Aluminum and chemical plants now projected for Canada, at the request of the United States, will take the bulk of the Dominion's available power.

Retreaders and Recappers to Get Camelback

AUTHORITY under which retreaders and recappers will be able to get initial allotments of camelback for passenger car tires and local rationing boards may issue certificates for purchase of new tubes for List B passenger cars and trucks is contained in Amendment 4 to the Revised Tire Rationing Regulations, announced by OPA. The amendment, which went into effect April 10, prohibits the application of truck-type camelback to tires to be used on passenger cars and the application of passenger-type material to truck tires.

A retreader or recapper who as of midnight March 22 had passenger-type camelback inventory equal to less than 500 pounds for each mold or curing table in his establishment capable of treading only tires smaller than 7.50-20 can get a certificate for purchase of enough to bring his stock as of March 23 up to that level. To get such a certificate, he must apply not later than April 30 to the local rationing board which serves the area in which his principal office is located.

Allocations for Latin America Announced

THE Government of the United States in accordance with the policy of close inter-American cooperation has announced in Washington a list of commodities allocated to the other American Republics for the second quarter of 1942. This announcement was made jointly by the U. S. Department of State, War Production Board, and Board of Economic Warfare. Machinery has been established in the interested government agencies to carry out the allocations program.

The announced list comprises acetic acid, acetone, aconite, ammonium sulfate, anhydrous ammonia, aniline, camphor, carbon tetrachloride, castor oil, chlorine, copper, cotton linters, dibutyl phthalate, electrodes, farm equipment, formaldehyde, glycerol, leather, ferromanganese, methanol, molybdenum, neat's-foot oil, phenol, phosphorus, phthalic anhydride, plastics, potash salts, potassium permanganate, rayon, red squill, household electric refrigerators, soda ash, sodium hydroxide, strontium chemicals, sulfuric acid, superphosphate, tanning materials, toluene, tricresyl phosphate, light trucks, tungsten and ferrotungsten, ferrovanadium, and wood pulp.

A number of new materials not previously under export allocation are included, and additional materials may be made available during this quarter.

Labor-Management Committees Report

A TOTAL of 500 labor-management committees reported to the War Production Board in the first 16 days of April that they have organized to get War Production Drives under way in their plants. These committees were organized to increase production to meet the President's goal of 45,000 tanks, 60,000 planes, 20,000 antiaircraft guns, and 8,000,000 tons of shipping this year. They are purely voluntary, organized and operating at the request of Donald M. Nelson, chairman of WPB.

Zinc Oxide in 1941

SALES of leaded zinc oxide established a new high by a wide margin in 1941, and those for zinc oxide were the highest recorded since 1929, according to the U. S. Bureau of Mines. Total sales of zinc oxide, lead-free and leaded, in 1941 had never previously been exceeded.

Of the total lead-free zinc oxide produced in 1941, 76 per cent was from domestic ore, a fractional per cent from foreign ore, 13 per cent from metal, and 11 per cent from scrap. In 1940, 64 per cent was from ore and 36 per cent from metal and scrap; in 1939, 59 and 41 per cent, and in 1938, 62 and 38 per cent, respectively. The high percentages from ore in 1941 and 1940 reflect the increasingly tight situation in regard to supplies of metal and scrap.

Petroleum Field Office Set Up in Pennsylvania

TO STIMULATE crude oil production in Appalachian oil fields for the war program, the Petroleum and Natural Gas Division of the U. S. Bureau of Mines is establishing a field office at Franklin, Penna

The bureau is staffing the office with six or seven technicians who will consult with operators and point out engineering precepts applicable to existing conditions in secondary recovery projects—oil properties which are partly depleted and produce profitably only when certain stimulative methods are used. Other studies designed to aid in maximum recovery of crude oil with a minimum of expense will be conducted.

Heading the new office at Franklin is C. J. Wilhelm, petroleum engineer, formerly assigned to the Bartlesville, Okla., Petroleum Experiment Station of the bureau. Also on the staff are S. S. Taylor and E. M. Tignor, both petroleum engineers of the bureau.

Record Pyrites Production in 1941

PRODUCTION of pyrites in the United States reached a new record of 659,498 long tons valued at $2,035,000 in 1941, the U. S. Bureau of Mines reports. This represents a 5 per cent increase over the revised figures of 626,640 tons valued at $1,920,000 in 1940. Producers consumed 443,983 long tons and sold 207,504 tons in 1941, compared with revised figures of 422,545 tons and 206,867 tons, respectively, in 1940.

Pyrites imported for consumption in the United States in the first nine months

of 1941 dropped to 224,264 long tons at $978,729, compared with 407,004 tons worth $1,351,367 in all of 1940. Canada furnished 79 per cent of the imports in 1941 and 20 per cent in 1940, and, except for a few hundred tons from Mexico, Spain supplied the balance. Figures showing exports of pyrites are not available.

Program for 700,000 Tons of Synthetic Rubber Announced

JESSE JONES, Secretary of Commerce, has announced that Rubber Reserve Company and Defense Plant Corporation have made contracts and agreements with oil, chemical, and rubber manufacturing companies which will bring the annual production of synthetic rubber to more than 700,000 tons. The plants will come into operation over the next 18 months and, if no unforeseen construction delays are encountered, all should be in production by the end of 1943.

Companies which will participate are Atlantic Refining Co., Carbide & Carbon Chemicals Co., Celanese Corp. of America, Cities Service Oil Co., Dow Chemical Co., E. I. du Pont de Nemours & Co., Inc., Firestone Tire & Rubber Co., B. F. Goodrich Co., Goodyear Tire & Rubber Co., Gulf Oil Co., Humble Oil & Refining Co., Hycar Chemical Co., Koppers Co., Monsanto Chemical Co., Phillips Petroleum Co., Pure Oil Co., Richfield Oil Corp., Shell Union Oil Corp., Sinclair Refining Co., Socony-Vacuum Oil Co., Inc., Standard Oil Co. (Indiana), Standard Oil Co. of New Jersey, Standard Oil Co. of Louisiana, The Texas Co., and United States Rubber Co.

In addition, two or three groups of smaller rubber manufacturers will probably be given contracts and supplied with raw materials from some of the above companies with which to manufacture rubber. The plants to be built by the rubber companies require less time to construct than facilities for the production of the raw materials.

U. S. 1941 Mineral Products Valued at $6,600,000,000

THE value of mineral products in the United States last year—estimated at $6,600,000,000 by the U. S. Bureau of Mines—increased 18 per cent over 1940 and reached the highest peak in history with the exception of 1920, when prices were abnormally high following the first World War. Preliminary data, collected by the bureau chiefly for use of war agencies, indicated that, while a general advance in price levels of minerals accounted in part for the increased value, the major factor was the substantial gain in output of both metallic and nonmetallic products. The bureau's estimate is expected to be surpassed in 1942 owing to higher prices and accelerated demands for war matériel.

Magnesium production in 1941 more than doubled that in 1940, bauxite output increased 107 per cent, and manganese ore advanced 89 per cent. Other minerals and mineral products which showed decided production increases for 1941 were: aluminum, 50 per cent; molybdenum, 38 per cent; mercury, 16 per cent; bituminous coal, 11 per cent; anthracite, 6 per cent; coke, 13 per cent; crude petroleum, 4 per cent; zinc, 12 per cent; lead, 9 per cent; and copper, 8 per cent. Shipments of iron ore were 23 per cent higher, shipments of cement rose 29 per cent, and those of high-grade clays, 31 per cent. Production of crude gypsum was 20 per cent higher; lime, 20 per cent; and stone, 15 per cent.

During 1941 the output of gold decreased about 0.8 per cent, and silver dropped about 0.4 per cent under 1940.

Wholesale Price Indexes

INDEX numbers of wholesale prices for chemicals and allied products have been released by the U. S. Department of Labor. With 1926 as 100, the indexes are:

PRODUCT	YEAR 1941	YEAR 1940	CHANGE %
Chemicals and allied products	84.6	77.0	+ 9.9
Chemicals	87.2	85.1	+ 2.5
Drugs and pharmaceuticals	105.1	88.9	+18.2
Fertilizer materials	73.5	69.4	+ 5.9
Mixed fertilizers	76.0	73.8	+ 3.0
Oils and fats	77.6	44.3	+75.2

Chemical Manufacturers' Indexes

IN JANUARY the value of chemical manufacturers' inventories was 152.0 compared with 143.7 in December and 117.2 in January of last year, taking 1939 at 100, according to the U. S. Department of Commerce. Taking January 1939 at 100, the value of chemical manufacturers' shipments in January was 196, compared with 171 in December and 142 in January 1941.

Production, Shipments, Stocks of Manganese Ore

DOMESTIC production of manganese ore containing 35 per cent or more manganese (natural) during February was 9,500 long tons, shipments were 9,600 tons, and producers' stocks at the end of the month were 1,300 tons, according to the U. S. Bureau of Mines. In January output was 11,700 long tons, shipments were 11,700 tons, and producers' stocks at the end of the month were 1,400 tons. Shipments in 1941 totaled 76,000 long tons or an average of about 6,300 tons per month. The rate of shipments averaged 3,344 tons monthly in 1940, when the total amounted to 40,123 tons.

Further Rise Boosts Kaolin Shipments above Million Tons

FOR three straight years production of a high-grade clay in the United States has made new records. In 1941 sales of domestic kaolin jumped to 1,087,848 short tons valued at $9,205,892 compared with 833,450 tons valued at $6,994,106 in 1940, the U. S. Bureau of Mines reports. The tonnage topped that of the previous year by 31 per cent and was more than double that of 1929. The paper industry alone required 110,000 tons more than in 1940 and consumed 56 per cent of the total shipments. The country needs more and more paper, larger proportions of clay are used in making high-grade paper, and doemstic clay is being used instead of imported clay both as filler and coating. Percentagewise, the consumption of clay for refractories, pottery, rubber, paint, and certain minor uses increased even more than shipments of paper clay.

Imports—almost all English clay, which is used chiefly in paper, sanitary ware, and pottery, and to a diminishing extent in porcelain and tile—amounted to only 66,935 short tons with a foreign market value of $698,502 for the first nine months of 1941. Import statistics for the last quarter cannot be published, but the total for 1941 was undoubtedly less than the 105,566 tons imported in 1940. Average figures for 1925-29 show imports of 339,014 tons and domestic shipments of only 453,618 tons a year, and during 1909-13 the ratio of imports to domestic shipments was nearly 2 to 1.

Memphis Abstracts

AS USUAL, sets of abstracts of meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts are now ready for delivery.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

NECROLOGY

Charles Morse Allen

CHARLES MORSE ALLEN, former head of the Department of Chemistry at Pratt Institute, died in Washington, D. C., on April 3 at the age of 82. Dr. Allen was born in Farmington, Maine, and was graduated from Wesleyan University in 1882. After teaching for seven years at Wyoming Seminary, he went to Pratt Institute, Brooklyn, N. Y., where he remained until his retirement in 1931. Dr. Allen was for some years a member of the AMERICAN CHEMICAL SOCIETY, which he joined in 1926.

Harry A. Carpenter

HARRY A. CARPENTER, outstanding figure in science teaching in the Nation's secondary schools and specialist in science for the Rochester, N. Y., Board of Education, died unexpectedly April 5 in Boston where he and Mrs. Carpenter were visiting. He was on an Easter vacation following the close of the Science Fair at Rundel Memorial Library which he originated for hundreds of scientific-minded high school children. Mr. Carpenter, who was 61 years old, was a cofounder of the Rochester Section of the AMERICAN CHEMICAL SOCIETY. He also instigated the Rochester School of the Air in 1933 and served as its pioneer broadcaster. The program attracted the attention of educators and today science broadcasts reach fifth, sixth, seventh, and eighth grade pupils not only in about 50 Rochester schools but also in some 200 schools outside Rochester. About 25,000 children are registered each semester.

Born in Honeoye Falls, Mr. Carpenter was graduated from the University of Rochester and joined the Rochester public school system in 1905 as head of the Chemistry Department at West High School. In 1911 he was advanced to become head of the school's Science Department, and a year later received his master of science degree from the University of Rochester along with his master of arts from Columbia University. During the last war he served as assistant to the chief chemist of the U. S. Bureau of Mines.

Several years after the war he was given supervision over all science classes in the city's junior and senior high schools. In 1926 Mr. Carpenter was appointed a lecturer in education at the University of Rochester, a post he held to the time of his death. In 1937 he attended the conference of the World Federation of Education Associations in Tokyo as assistant general secretary of the American Association for the Advancement of Science.

Mr. Carpenter was Chairman of the A. C. S. Rochester Section from 1916 to 1917 and president of the State Science Teachers Association in 1917–19. He was a director of three education organizations, the State Science Teachers Association, American Science Teachers Associations, and National Association for Research in Science. He was also president of the Rochester Science Center which sponsored the Science Fair. He was a contributing editor for *Science Education* and the *Journal of Chemical Education*, for some years elementary science editor of *School Science and Mathematics*, and author of a number of books and articles.

A. Brooking Davis

A. BROOKING DAVIS, cofounder and president of the Hilton-Davis Chemical Co., Cincinnati, died March 11 after a three-month illness. He was 59 years old.

Mr. Davis, a native of Illinois, studied chemistry at the University of Alabama. He worked for several oil and gas companies and as chemist for Eli Lilly & Company before going to Cincinnati in 1916 as director of research for the Ault & Wiborg Co. Three years later he became assistant general manager for the Cincinnati Chemical Works.

The Hilton-Davis Co. was organized in 1921 with Mr. Davis as vice president and Robert Hilton as president. Mr. Davis became head of the firm upon the death of Mr. Hilton six months after the founding. The company in its first year had one employee and sales amounted to $12,800. Today its plant covers 89 acres and 400 men are hired. Sales for 1940 amounted to nearly $3,000,000.

Mr. Davis had been a member of the AMERICAN CHEMICAL SOCIETY for 35 years.

Thomas Jobson

THOMAS JOBSON, a pioneer in development of alloy and tool steel in England, died April 12 in the Morristown, N. J., Memorial Hospital. He was 86 years old.

Mr. Jobson, a resident of Whippany, N. J., at the time of his death, was born at Newcastle-on-Tyne, England, and was graduated from the Royal College of Science where he specialized in chemistry and metallurgy. He first became affiliated with a steel concern in Sheffield, England, and came to the United States in 1912 to work with the United States Crucible Steel Co. At the time of his retirement in 1933 he was chief metallurgist.

Charles A. Kern

CHARLES A. KERN, associate professor of analytical chemistry at the University of Vermont, died February 16 at Winter Park, Fla. Professor Kern was graduated from the University of Vermont in 1901 and taught there for 38 years. Of wide interests and distinctively artistic feeling, his teaching and his associations with his students were notable for their cultural and civilizing influences.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1909.

Robert L. Perkins

ROBERT L. PERKINS, research group leader of the National Aniline & Chemical Co., died February 15 in East Aurora, N. Y. Mr. Perkins was born in Boyne City, Mich., June 5, 1890. He was graduated with a pharmaceutical degree from the University of Valparaiso, Ind., and held the bachelor of science and master of science degrees from the University of Michigan, where he served as instructor. He had also been research drug chemist for Parke, Davis & Co., Detroit.

Mr. Perkins had been a member of the AMERICAN CHEMICAL SOCIETY since 1918. For many years he had been active in musical groups.

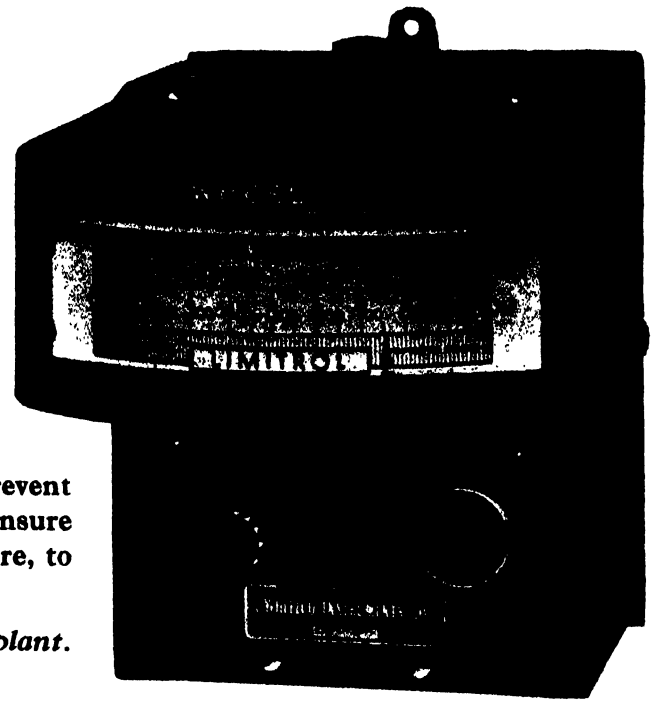
Cornell Summer Courses in Microchemistry

DURING the coming summer session, June 29 to August 7, the Department of Chemistry, Cornell University, Ithaca, N. Y., will offer courses that may be taken separately or in combination, as the time and needs of the student justify.

Quantitative microanalysis will cover inorganic and organic procedures according to the methods of Pregl and others. Enrollment is limited, and inquiries should be addressed to M. L. Nichols.

Introductory chemical microscopy will include studies of particle size, optical properties and physical chemistry of crystals, lens systems and photomicrography, and applications to technical materials. Microscopical qualitative analysis will cover the common inorganic anions and cations. Inquiries regarding these courses or a shorter term of study should be addressed to C. W. Mason.

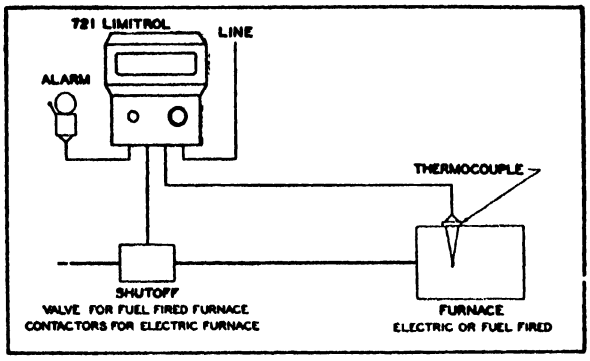
FOR CHEAP INSURANCE - - -



Use Wheelco LIMITROLS

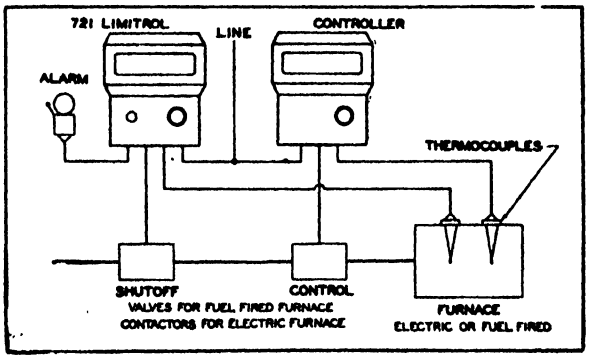
The cheapest insurance you can buy for your plant is *Preventive Insurance.* Wheelco Limitrols provide *Preventive Insurance* by protecting you against the losses excessive temperatures can cause in your processes.

The Limitrol combines a high resistance pyrometer with an electrically operated automatic shut-off device to give you (1) continuous, accurate, temperature readings, and (2) automatic shut-off of heat input when the temperature measured reaches a point selected and set on the pyrometer scale.



The Limitrol may be used as a safety device to prevent temperature from rising above a danger point, or to insure shut-down of equipment, at any desired temperature, to obtain the exact material specifications required.

Investigate the applications for Limitrols in your plant.



Wheelco Limitrol.

Diagrams below show typical methods of installing Limitrols.

Operating Diagram showing use of Limitrol only.

Operating Diagram showing Limitrol used in conjunction with a temperature controller.

LIMITROL FEATURES

Can be used in conjunction with controllers of any type, or it can be used alone.

Protects equipment from being overheated due to failure of control or switching apparatus.

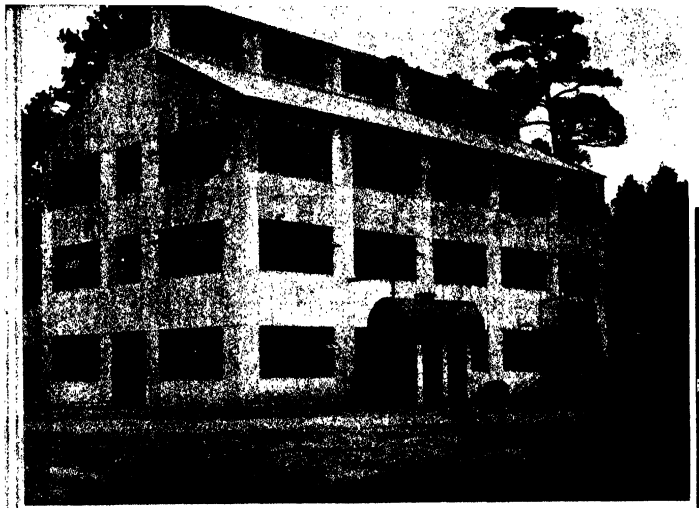
Equipment cannot be turned on again until temperature has dropped to safe limit.

Any point on the scale can be selected as a shut-off point.

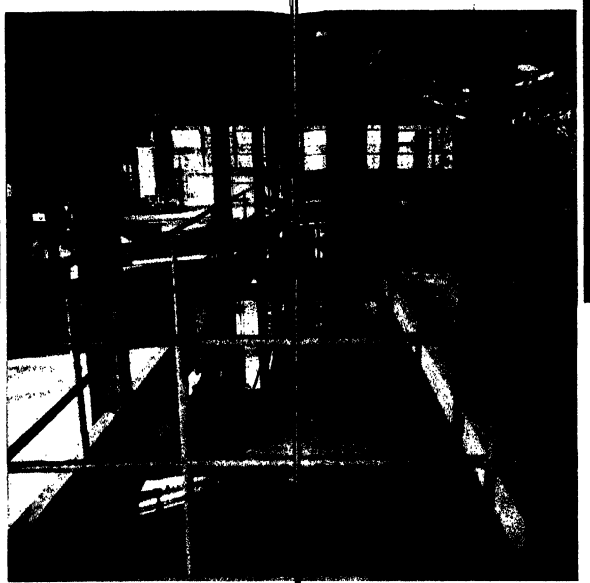
Thermocouple Break — Will shut off equipment if thermocouple is broken.

"Radio Principle" — Limitrols employ the famous Wheelco "Radio Principle" Control.

Limitrol Scales — 6" long.



Scale Ranges — 0 to 3600° F. or equivalent ° C.



Write today for your copy of Limitrol Bulletin No. D202-3.

Wheelco Instruments Co.

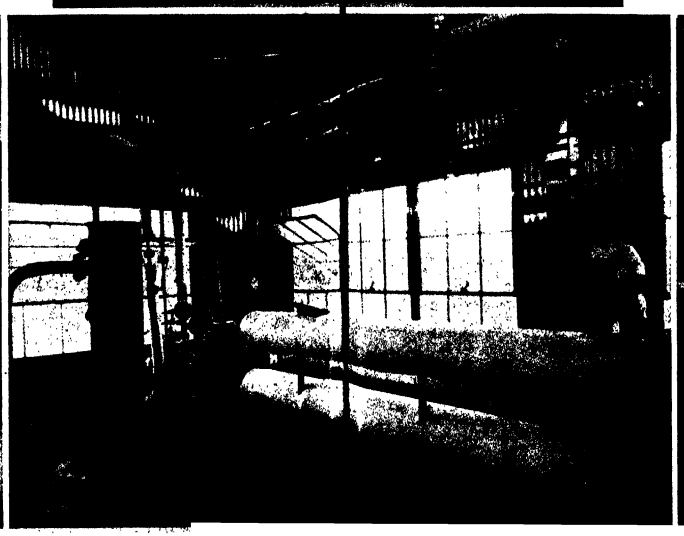
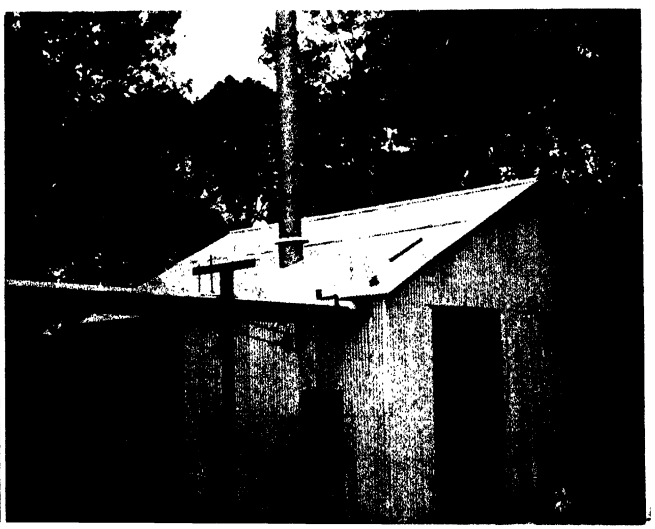
CHEMICAL NEWS PARADE





Speeded to meet growing demands of the war program are facilities of the Hercules Powder Co. for production of rosin esters at Hattiesburg, Miss., illustrated in this issue's Chemical News Parade. The new plant is unique in that it utilizes molten rosin delivered to it by pipe line from the adjoining Hercules naval stores plant. Use of molten rosin eliminates the packing, cooling, shipping, cracking, and remelting operations in handling rosin. The plant has been located advantageously at Hattiesburg because of the proximity of large supplies of rosin and hydrogen. Hydrogen, required in large quantities for the manufacture of hydrogenated methyl abietate, is obtained by cracking natural gas available in Louisiana and Mississippi. Deliveries are facilitated by tank car loading equipment and use of the Gulf ports. *Above.* The rosin ester plant of the Synthetics Department of Hercules. *Right.* Looking through the center wall from the second mezzanine floor. The heat exhangers are in the center and the rosin holding tanks are to the left and the right on the upper floor. *Below.* A resin kettle used in the manufacture of Pentalyn. *Above.* A continuous high-vacuum still for production of liquid rosin esters. In this still crude methyl abietate is refined to purify the abietate. *Left below.* Rosin and methanol preheaters used in the manufacture of Abalyn. At the left is a methyl alcohol rectifying column. *Below.* Dowtherm heater house. Demand for rosin esters—Abalyn, methyl abietate; Hercolyn, hydrogenated methyl abietate; Flexalyn, diethylene glycol diabietate; Pentalyn, pentaerythritol tetra-abietate; Staybelite, hydrogenated rosin and Staybelite ester gums—increased so rapidly during 1941 that sharp expansion of manufacturing facilities was required. Stimulated by price reductions announced a year ago for all of the rosin esters, existing fields for these products were expanded and new uses developed. Principal outlets for Abalyn and Hercolyn developed during 1941 were as plasticizers in nitrocellulose lacquers, adhesives, ethyl cellulose, chlorinated rubber, cumar and high-melting asphalts and pitches for roofing, floor tile, caulking compounds, and box toes. Use of the Pentalyn esters in oil varnishes has been increased by the shortage of tung oil.

American Chemical Society[1]

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., spring of 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION. Stevens Hotel, Chicago, Ill., November 17 to 22, 1942.

NINETEENTH NATIONAL COLLOID SYMPOSIUM, Division of Colloid Chemistry. University of Colorado, Boulder, Colo., June 18 to 20, 1942.

Other Scientific Societies

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, Southwestern Division. Las Cruces, N. Mex., April 27 to 30. Annual meeting.

AMERICAN ASSOCIATION OF CEREAL CHEMISTS. Edgewater Beach Hotel, Chicago, Ill., May 18 to 22. Annual meeting.

AMERICAN ASSOCIATION OF PHYSICS TEACHERS. State College, Penna., June 25 to 27.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Boston, Mass., May 11 to 13.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Chicago, Ill., June 22 to 26.

AMERICAN LEATHER CHEMISTS ASSOCIATION. Deshler-Walleck Hotel, Columbus, Ohio, June 1 and 2.

AMERICAN OIL CHEMISTS' SOCIETY. Rice Hotel, Houston, Tex., April 30 and May 1.

AMERICAN PHYSICAL SOCIETY. State College, Penna., June 25 to 27.

AMERICAN SOCIETY OF BREWING CHEMISTS. Netherland-Plaza Hotel, Cincinnati, Ohio, May 25 to 27.

AMERICAN SOCIETY OF REFRIGERATING ENGINEERS. Skytop Club, Skytop, Penna., June 7 to 9.

AMERICAN SOCIETY FOR TESTING MATERIALS. Atlantic City, N. J., June 22 to 26.

INSTITUTE OF FOOD TECHNOLOGISTS. Hotel Nicollet, Minneapolis, Minn., June 15 to 17. Annual meeting.

SCIENTIFIC APPARATUS MAKERS OF AMERICA. Hotel Hershey, Hershey, Penna., June 1 to 3.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Columbia University, New York, N. Y., June 27 and 28. Annual meeting.

[1] The list of the SOCIETY's National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 187 of the February 10 issue.

X-Ray and Electron Diffraction Program Scheduled

A JOINT meeting of the American Association for the Advancement of Science, Section C, and the American Society for X-Ray and Electron Diffraction will be held at Gibson Island, Md., July 27 to 31. Registration and reservations should be made through the director of the Gibson Island Conferences, Neil E. Gordon, Central College, Fayette, Mo.

X-Ray and Electron Diffraction

B. E. WARREN, *Chairman*
A. L. PATTERSON, *Vice Chairman*

July 27
- I. FANKUCHEN. X-Ray Patterns of Imperfect Crystals.
- J. T. NORTON. X-Ray Diffraction Methods for Measuring Stresses in Metals.

July 28
- J. C. M. BRENTANO. Intensities in X-Ray Diffraction.
- K. LARK-HOROVITZ. Intensity Problem in Electron Diffraction Patterns.

July 29
- S. B. HENDRICKS. Types and Extent of Isomorphous Replacements in Silicate Structures.
- P. DEBYE. Temperature Diffuse Scattering.

July 30
- L. K. FREVEL. Chemical Analysis by Diffraction Methods.
- W. O. MILLIGAN. X-Ray and Electron Diffraction Examination of Inorganic Colloidal Materials.

July 31
- D. HARKER. Metallographic Results with the Electron Microscope.

A business meeting of the American Society for X-Ray and Electron Diffraction will be held at the conference room, Wednesday afternoon, July 29.

Summer Conference of New England Chemistry Teachers

THE New England Association of Chemistry Teachers is making plans for its fourth annual conference, which will be held on the campus of the University of New Hampshire, Durham, N. H., August 11 to 14, 1942. The program will include a Symposium on Atomic Structure, headed by J. E. Cavelti of Allegheny College.

Information regarding registration, program, and accommodations may be secured from Millard W. Bosworth, Vermont Academy, Saxtons River, Vt.

Meeting of American Society of Brewing Chemists

PLANS for the annual meeting of the American Society of Brewing Chemists, to be held at the Netherland-Plaza Hotel, Cincinnati, Ohio, May 25 to 27, are being completed. Features will include addresses by Carl F. Cori on "Enzymes in Yeast Fermentation", and by William H. Stein on "Current Problems and Recent Advances in the Chemistry of Proteins".

Detroit Rubber and Plastics Group Meets

A. A. SOMERVILLE, of the R. T. Vanderbilt Co., New York, will speak to the Detroit Rubber and Plastics Group in the Detroit Leland Hotel, May 8 at 8:00 P. M. Dr. Somerville's subject, "Latest Dope on Synthetic Rubber as Related to Accelerators and Plasticizing and High-Temperature Testing", will be presented before members of the group and guests. Arrangements for the dinner preceding the meeting, to be served at 6:45 P. M. should be made through Ed. Kvett of the Baldwin Rubber Co., Pontiac, Mich., or E. F. Riesing, Firestone Tire & Rubber Co., 1405 Henry St., Detroit.

Technical Program of A. A. T. C. C.

KENNETH H. BARNARD, Pacific Mills, will serve again as chairman of the Technical Program Committee for the 1942 annual meeting of the American Association of Textile Chemists & Colorists. This convention will be held late this year; the date and place have not been definitely set. Possibly Atlantic City will be selected.

The 1941 annual meeting was held in Pinehurst, was well attended by delegates from all parts of the country, and was very successful, especially from the point of view of the technical program. In keeping with the times the 1942 technical program will be devoted primarily to textile and chemical problems in connection with this country's war effort. It has been planned to hold again an intersectional contest because of the wide interest shown in it during the past two conventions. It is expected that the subjects selected for this contest by the individual sections will also pertain to the country's defense program.

Suggestions regarding suitable topics for the technical program may be referred to Mr. Barnard at 119 Lowell St., Shawsheen Village, Andover, Mass. and those who wish to present papers on a textile or chemical subject should also write to him.

Cereal Chemists Plan Chicago Meeting

THE annual meeting of the American Association of Cereal Chemists, scheduled at the Edgewater Beach Hotel, Chicago, May 18 to 21, will hold sessions on Agronomy and Milling Technology; Statistical Clinic; Cake, Biscuit, and Cracker Technology; Laboratory Baking Methods; Malting and Brewing; Protein Symposium; Bread Baking Technology; General Analytical Methods; and Symposium on Flour and Bread Nutritional Supplements. Cereal chemists may discuss their statistical problems at the statistical clinic, which consists of a joint session of the association with the Biometric Section of the American Statistical Association.

R. A. Gortner of the University of Minnesota will give the Osborne Medal Award address on "The Plant Proteins". Among other speakers will be F. T. Hogness of the University of Chicago, C. H. Goulden of the Dominion Rust Research Laboratory, Winnipeg, Manitoba, R. M. Hixon of Iowa State College, C. A. Elvehjem of the University of Wisconsin, R. R. Williams of the Bell Telephone Laboratories, and Clara Gebhard Snyder of The Wheat Flour Institute.

Sixty-four papers and addresses have been listed.

Further information about the meeting may be obtained from F. L. Dunlap, chairman of the Publicity Committee, at Wallace & Tiernan Co., Inc., 809 West Washington Blvd., Chicago, Ill.

Lectures on Civil Air and Chemical Warfare Defense

IN CHEMICAL AND ENGINEERING NEWS for March 10, 1942, page 321, reference was made to the practical course in home defense being given by the Speakers' Bureau of the Philadelphia Section of the AMERICAN CHEMICAL SOCIETY.

Lecture demonstrations were given on 10 consecutive Friday evenings, beginning January 23, 1942, nine of them including lantern slides, and most of them exhibits, demonstrations, and films. After each lecture a concise set of reference notes was distributed, covering the subject of the meeting. The topics presented were: The Military Airplane, Collective and Individual Protection against High Explosive Bombs and against Incendiary Bombs, Chemical Warfare in General, Properties and Identification of Chemical Agents, Tactical Use of Chemical Warfare, Individual Protection against Gas Inhalation and against Vesicants, Decontamination, Collective Protection against Gas Attacks, Organization for Civil Air Defense, and First Aid Treatments for Victims of Gas and Bomb Attacks.

This undertaking proved a great success, and the lectures were attended by considerable numbers of both chemists and non-chemists, including Sector and Post Wardens. The chairman of the Speakers' Bureau is O. F. Roller, Jr., 4817 Regent St., Philadelphia, Penna.

Hearing on Fruit Cocktail Standards Reopened

A PUBLIC hearing will be held at 10:00 A. M., May 11, in Room 3106, Department of Agriculture South Building, Independence Avenue and 12th Street, S. W., Washington, D. C., to receive additional evidence on proposals for standards of quality and fill of container for canned fruit cocktail, according to the FSA.

New Members Elected March 1 to April 1, 1942

Total Membership as of April 1—30,236

Akron Section. Gilbert H. Boeder[1], Gerard F. Cohan[1], Harry E. Eckert, Jr.[1], Richard W. Kibler[1], Leroy B. Kuhn[1], Grant P. Lawless[1], George W. McLaren, Jr.[1], Paul F. Niessen.

Alabama Section. Ellis E. Creitz, L. W. Donaldson, William Perlman[1], Wynelle D. Thompson, Joe K. Trauerman, Jr.[1].

Ames Section. Robert E. Rundle.

Baton Rouge Section. Charles E. Marks[1], Rafael J. Tamargo[1].

California Section. Lisle Baldwin[1], Harold H. Boyd, James Chickinoff[1], Sam U. Greenberg, Carl E. Hendel, Richard A. O'Connell, Jr.[1], Edward L. Prudhomme[1], Paul J. Rollin, Willis G. Routson[1].

Central Pennsylvania Section. Herman Adelman[1], Martin Faye, D. E. Haley, John C. Heffner[1], Vito C. Lazzaro, William E. Lord[1], John N. Manbeck, Martin W. Morgan[1], Dalton A. Pearson[1], Robert M. Yahres, David A. Young[1].

Central Texas Section. Kurn Kenneth Moore[1], James W. Morris[1].

Chicago Section. William A. Bonner[1], David L. Carpenter, Irvin A. Clausen, Alan F. Clifford[1], Ronald G. Crosier, Robert E. Deremiah[1], Robert K. Deutsch[1], Bernard J. Finkle[1], Max M. Gethner[1], Ralph A. Goldenberg[1], J. Arthur Gross, Morrison H. Grossman[1], Everett A. Hodges[1], Elwood V. Jensen[1], Harold C. Johnson, E. K. Jones, Ralph B. Jones, William M. Leaders, Morris A. Lipton, Frederick H. Low, Joseph A. Lubits[1], John D. T. Lundin[1], Robert W. Manuel, Harry C. Mehring, Charles G. Moore, Roy L. Mosemiller[1], John A. Munts, William Pastercsyk[1], Lester J. Perlman[1], William R. Remington[1], Walter O. Schellenberg[1], Thomas E. Sharp, Andrew D. Singleton[1], Walter D. Smuts, John C. Stauffer, Martin Steinberg[1], Maria Willfort Torok[1], Alfred J. Webber[1], Harold Ziskin[1].

Cincinnati Section. A. Doyle Abbott, Neil F. Baumgartner[1], William A. Neiser, Jr.[1], Edward Trepper[1].

Cleveland Section. Arnold E. Bereit[1], Ernest A. Brown, George R. Jackson[1], Frank W. Jones, Richard Laubmann, Kenneth L. Mattern[1], Robert A. Sturges[1].

Colorado Section. Willard M. Dow[1], Harry M. George.

Columbus Section. Sidney R. Steele[1].

Connecticut Valley Section. William H. Ebelke, Stanley J. Kaseniac[1], Walter A. Maclinn, Anthony J. Urjil[1], Dorothy Wrinch, John A. Young[1].

Cornell Section. William S. Barnhart[1], Richard B. Hasbrouck[1], Peng Cheng Hsu[1], James M. Meyers[1].

Dayton Section. Herbert C. Morris[1].

Delaware Section. C. Franklin Miller.

Detroit Section. Harry K. Beasley[1], Ford Richardson Bryan, J. Harold Burns, Steve Eisner[1], Francis F. Farley, John R. Lewis[1], Frederick J. Marshall[1], Ford G. Martin[1], Milton H. Merchant, Roy J. Morris[1], Jack Patt, Marian Sawatskie[1], R. Bruce Scott[1], Ernest M. Skytta[1], Newton E. Whitman, Carl A. Winberg[1].

Eastern New York Section. Harold M. Belkin[1], Robert K. Staman.

Erie Section. Harley Willard Burchard.

Florida Section. Emanuel H. Bresler[1].

Georgia Section. M. C. Allen, Jr., John William Boyle, Jr.[1], Wiley M. Branan[1], Paul E. Morrow[1], Harvey L. Parry[1], Wilbur B. Ratterree[1].

Hawaii Section. Y. S. Loo, Joseph B. O'Toole, Jr.[1].

Illinois-Iowa Section. Herbert A. Poits[1].

Indiana Section. Robert H. Campbell[1], Keith D. Crane, Janet R. Laird[1], Marshall W. Mead[1], Joseph Francis O'Mahoney, Jr.[1].

Iowa Section. Robert B. Anderson, Lawrence E. Beesley[1], Douglas S. Billington, Raymond Borchers, Milton Heinrich[1], Richard J. Ihne[1], Arnold H. Schein, Robert W. Shideler, Ernest H. Sieveka.

Kanawha Valley Section. T. Joseph Cuerdon, Jr., Kenneth L. Godfrey.

Kansas City Section. Ben Poisner, J. Leon Sealey, R. Devere Wallace[1], Ben W. Warner[1], John B. Williams.

Kansas State College. Donald J. Edgar[1], Colter A. Landis[1], Ralph E. Samuelson[1].

Lehigh Valley Section. George E. Cameron[1], Willard S. Clewell, Jr.[1], Leroy P. Hall, Louis J. Hillenbrand, Jr.[1], Ernst C. Koerner, Max B. Mellnor[1], Walter Singlevich[1].

Lexington Section. Wayne V. McConnell[1], Thomas H. Shelley, Jr.[1].

Louisiana Section. Fred E. Boettner[1], Howard Claire Eshelman, Leon Siegel.

Louisville Section. H. R. Bilford[1], Albert L. Bollinger, Samuel B. Crecelius, Paul F. X. Dunigan[1], Maurice F. Griffel[1], John C. Kalbach, Wayne May[1], Carl E. Moore[1],

The ELECTRON MICROSCOPE

by E. F. BURTON

Head, Department of Physics, University of Toronto

and

W. H. KOHL

Development Engineer, Rogers Radio Tubes, Ltd., Toronto

The first electron microscope in America was designed and built in 1938 by the authors of this book, assisted by James Hillier, who was at that time a student of Dr. Burton's. Since then, news of the miraculous accomplishments of this instrument has spread rapidly through the scientific world. Actual magnifications of 67,000 diameters have been attained, enabling investigators to see organisms and colloidal particles of the order of magnitude of large molecules. The significance of this achievement in the fields of applied chemistry, bacteriology and biochemistry can scarcely be exaggerated. The industrial applications of the electron microscope already include the study of paper-coating clays, rosin size, wood and asbestos fibers, carbon black, and metallic oxide structures. Several of the larger research laboratories have installed them, and many others are planning to do so.

The book simply and clearly describes the fundamentals of the optical and electron microscopes; many original line drawings illustrate the more important points. A large number of striking photographs of industrial materials and bacteria will be of absorbing interest to all.

Contents: Preface. Introduction. Vision—How We See. Light Microscopes. What Is Light? Wave Motion. Wave Theory of Light. Electromagnetic Theory of Light. The Electron. The Dual Theory of Light. The Dual Theory of Electrons. Motion of Electrons in an Electric Field. Electrostatic Electron Mirrors and Lenses. Magnetic Electron Lenses. The History of the Electron Microscope. The Electrostatic Electron Microscope. Applications of Electrostatic Electron Microscope. The Compound Electron Microscope—Magnetic Type. What the Electron Microscope Can Accomplish. Bibliography. Index.

"Find out what happens when you substitute

ammonium thiocyanate"★

★ Ammonium Sulfocyanide

If you use an ammonium salt in your process you should experiment with substituting Ammonium Thiocyanate (Ammonium Sulfocyanide). Perhaps you will discover valuable modifications.

Test it in your laboratory in place of the chloride, the oxalate, the acetate, the carbonate or the nitrate.

The variations that occur from the Thiocyanate group might bring interesting and worthwhile results.

Koppers has placed in operation a large commercial plant for the production of Ammonium Thiocyanate crystals and can now offer this chemical in quantity at substantial savings over former costs. Koppers can supply Ammonium Thiocyanate crystals with a minimum purity of 95%.

Test samples, quotations and further information on request.

Registration of Engineers in Massachusetts

THE Board of Registration of Professional Engineers and of Land Surveyors for the Commonwealth of Massachusetts, created by an act of the legislature on October 9, 1941, has been organized and is receiving applications for registration. Forms may be obtained from the Division of Registration, 413 State House, Boston, Mass.

The board consists of Ralph F. Gow, (mechanical engineering), chairman; Gustavus J. Esselen (chemical engineering), vice chairman; Holcombe J. Brown (mining and metallurgy); Karl B. McEachron (electrical engineering); and Albert Haertlein (civil engineering), secretary.

Reclamation of Commercial Solvents

THE Industrial Salvage Section, Bureau of Industrial Conservation, War Production Board, Room 2605, Social Security Building, Washington, D. C., requires a list of all companies and parties engaged in the salvage and reclamation of commercial solvents. Although companies that reclaim commercial solvents for themselves and others are known, the list is incomplete and it is in the interests of national defense that the board be assisted in completing this information.

If our readers know of companies capable of reclamation of commercial solvents over and above their present capacity, such data would be valuable and a definite contribution to the conservation program of the War Production Board. Letters should be addressed to the attention of E. F. Mulligan.

On land . . . at sea . . . or in the air!

Our files contain data on many specific applications not listed here. Prompt engineering advice will follow an inquiry submitting a definite control problem.

Industrial Instruments, Inc.
156 Culver Ave., Jersey City, N. J.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Acid Pumps. A centrifugal pump in which all wetted parts are made of plastic is described in this 4-page bulletin. Another feature of this pump is that it contains no stuffing box. Included is a list of solutions which may be safely handled. *Bulletin E-4320 CEN.* A. R. WILFLEY & SONS, INC., Box 2330, Denver, Colo.

Carbon, Graphite, and Metal-Graphite Brushes are illustrated in a 24-page bulletin. The catalog contains base prices of standard sizes of brushes and gives a simple method for computing prices for each style. *Catalog K-15 CEN.* KEYSTONE CARBON CO., INC., 1935 State St., Saint Marys, Penna.

Carburizers. A 24-page booklet describes the construction and operation of steel carburizing equipment. Effects on steel for various lengths of carburizing treatment are shown in a series of photomicrographs. *Bulletin HD-142 CEN.* HEVI DUTY ELECTRIC CO., Milwaukee, Wis.

Centrifugal Pumps. A 36-page bulletin describes a line of single-stage pumps in which the housing for the motor and pump are cast in a single unit. Compactness and certainty of alignment are a few of the features listed. Capacities range from 10 to 2,750 gallons per minute. *Bulletin B6018-B CEN.* ALLIS-CHALMERS, Milwaukee, Wis.

Centrifugal Pumps. This 12-page bulletin covers single-stage, split case, centrifugal pumps which are suitable for a wide variety of pumping applications. *Bulletin D-70 CEN.* LAWRENCE PUMP AND ENGINE CO., Lawrence, Mass.

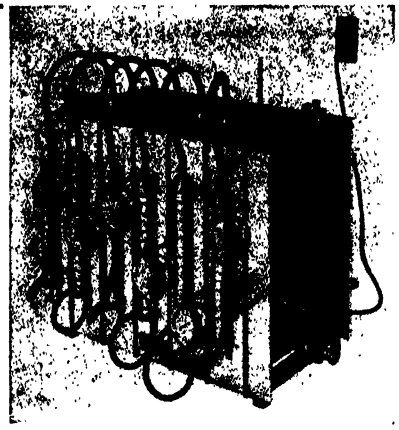
Compounding Rubber with Spheron Carbon Black. This 24-page booklet reports on the resistance to abrasion and flexing determined on several tread-type rubber stocks. Different test stocks were made by varying grade and content of Spheron and amount of whole-tire reclaimed rubber. Formulas tested are given. Results are expressed by means of bar charts and photographs of samples. *Spheron in Reclaim Tread Stocks Booklet CEN.* GODFREY L. CABOT, INC., Boston, Mass.

Compressors. A 28-page bulletin describes horizontal, duplex, motor-driven compressors which are available in sizes ranging from 75 to 3,000 hp. *Bulletin L-675-B1 CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Demineralized Water. This one-page folder details the water-demineralizing process which in the first step replaces the metallic ions (forming acids) and in the second step absorbs the acids. The product obtained approaches distilled water in quality at a cost said to be only a fraction of the cost of distilling. *Permutit Process for Demineralizing Water Booklet CEN.* PERMUTIT CO., 330 West 42nd St., New York, N. Y.

Die Casting. This 28-page illustrated booklet on die casting discusses possible savings in metal, machines, and manpower that may result when die casting is used in place of other methods. *Doehler Die Castings Bulletin CEN.* DOEHLER DIE CASTING CO., 386 Fourth Ave., New York, N. Y.

Dust Collectors. Filtration-type dust collectors and their applications are described in a 54-page illustrated booklet. An entire section is devoted to engineering data. *Catalog 72 CEN.* AMERICAN FOUNDRY EQUIPMENT CO., 615 South Byrkit St., Mishawaka, Ind.



Emulsifying and Dispersing Machinery. A colloid mill and a homogenizer designed for pilot-plant or laboratory use are described in a 12-page bulletin. *Bulletin 32C CEN.* MANTON-GAULIN MFG. CO., INC., 7 Charlton St., Everett, Mass.

Gas and Oil Burners. Burners designed to utilize both oil and gas, employing steam or mechanical atomizers, are described in a 4-page folder. *Bulletin 203 CEN.* PEABODY ENGINEERING CORP., 580 Fifth Ave., New York, N. Y.

High-Pressure Reaction Kettles. A standardized line of high-pressure, glass-lined reaction kettles is the subject of a 12-page bulletin. These kettles are available to withstand an internal pressure as high as 125 pounds and a jacket pressure of 90 pounds. Capacities range from 350 to 2,000 gallons. A special feature is the tripod drive mount, which permits easier access to the agitator stuffing box. *Bulletin 810 CEN.* PFAUDLER CO., Rochester, N. Y.

Humidifying Unit. An industrial unit designed to humidify, clean, and heat air is described in a single-page folder. These units are said to be particularly adapted to maintaining high humidities in textile mills, paper and printing plants, or chemical storage buildings. *Folder 43G-1 CEN.* CARRIER CORP., Syracuse, N. Y.

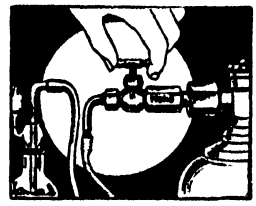
Specify Florite Desiccant



For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

Quick-Hardening Iron Cement

A NEW product has been developed by Smooth-On Manufacturing Co., 570 Communipaw Ave., Jersey City, N. J., for patching cracks, ruts, and shallow holes in concrete floors. This product, known as Smooth-On 7B quick patch cement, adheres firmly to surfaces with which it is in contact. Like other Smooth-On cements, the composition has an iron base, so that it is extremely wear-resistant as well as dustproof, oilproof, and waterproof. Patches of Smooth-On 7B harden overnight and become stronger with age.

New Clotting Globulin

New protection for hemophiliacs against danger of excessive bleeding and effective help for physicians, surgeons, and dentists in staunching the flow of blood from small wounds is provided by a new, powerful agent for clotting blood announced by Lederle Laboratories, Inc., 30 Rockefeller Plaza, New York.

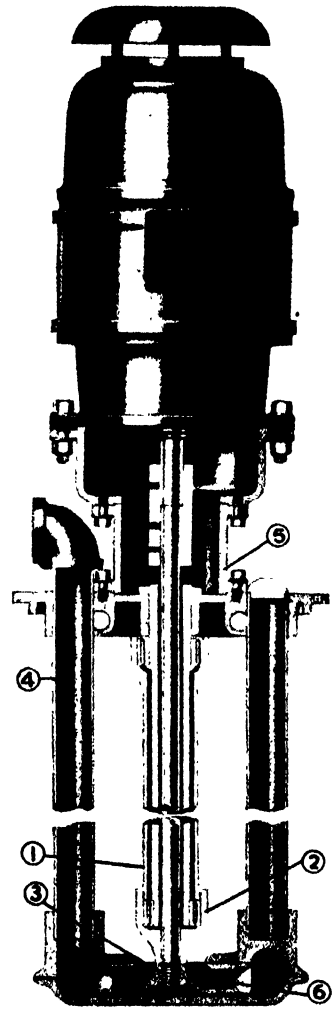
The new material, clotting globulin, is the natural clotting constituent of blood separated in highly concentrated form from clear blood plasma.

Many persons bleed excessively from minor wounds because their blood contains too little of the clotting principle (prothrombin). This condition may be inherited and permanent (hemophilia) or it may be temporary, the result of the ravages of disease or other causes. No satisfactory method has been known before to control bleeding in persons thus afflicted and even pulling their teeth has involved serious hazard to their lives.

The new clotting globulin supplies the important constituent in which the blood of "bleeders" is deficient and places in the hands of the medical and dental professions an effective means for stopping the flow of blood from minor wounds in a few seconds. The procedure is simple. A few drops of a solution of clotting globulin are applied to the surface of the wound, either by spraying or on sterile absorbent cotton or gauze, followed by gentle pressure. By making up the deficiency of the patient's blood, this treatment causes it to clot in the capillary blood vessels within a few seconds. The method is not effective against bleeding from veins or arteries—this requires surgical treatment—but it has been shown at Boston City Hospital and elsewhere to stop bleeding from minor wounds quickly.

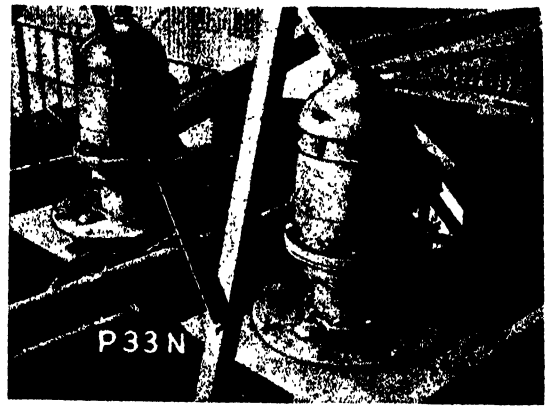
Clotting globulin was first isolated from clear blood plasma by I. A. Parfentjev, Department of Biological Research of Lederle Laboratories, Pearl River, N. Y. Dr. Parfentjev added ammonium sulfate solution to blood plasma and thus obtained a precipitate. When separated by filtration from the remaining plasma and dissolved in a solution of sodium chloride, this product possesses extraordinary power to hasten the clotting of blood even when anticoagulants have been added to it. Subsequent laboratory and clinical tests by others confirm the effectiveness and high potency of Dr. Parfentjev's preparation which is now available for general use by the medical and dental professions as Clotting Globulin Lederle.

Clotting globulin possesses true thrombic activity in coagulating the fibrinogen of the blood. It acts by supplementing the prothrombin naturally present. Clotting globulin can only be used locally and under the supervision of a doctor or dentist. Its effect is solely to coagulate the blood at the point of application, and it does not remove danger of excessive bleeding from other wounds.



The things that give trouble were *"included out"* in designing this pump

Over the last 30 years Amsco has built a lot of pumps—more than half of those used for sand and gravel production; pumps for ash handling in power plants; ore and tailings movement in metal mines; and for contractors: services that are very abusive and which demand the ultimate in design and construction materials. Therefore, many of the operating problems that might arise are well known to us.



In designing the recently developed line of Amsco-Nagle Industrial Pumps, our engineers eliminated the causes of frequent replacements, high maintenance costs and inefficient operation. The result is a line of pumps that copes with the most abusive conditions.

The Amsco-Nagle Type "QW" Wet Pit Pump shown exemplifies the sound engineering thinking that went into the design of the complete line of vertical and horizontal pumps.

Identified are six design features that eliminate troubles common to pumps of this type: (1) no submerged bearings to abrade, corrode or present lubrication problems; (2) no stuffing box to require packing; (3) inverted inlet eliminates gas binding and makes use of hydraulic thrust to counterbalance the weight of the revolving parts; (4) use of discharge pipe as a structural member reduces weight; increases rigidity; (5) lubrication from above floor plate; (6) impellers — shrouded or open—screwed on.

Two 3", Frame 14, Type "QW" Pumps with 15 h.p. 1200 r.p.m. motors, are shown (P33N), giving excellent service in air washing system handling sludge composed of highly abrasive foundry sand, dust and water at the rate of 400 g.p.m. against a 100' total dynamic head. Amsco-Nagle Pumps are available in standard sizes from 4" to 12", in capacities up to 7,000 g.p.m. for heads up to 200' with water ends of a wide choice of abrasion and corrosion resistant materials. Bulletin 910 describes cost-cutting features throughout the line.

Rust Protection

To find how oxygen combines with metals and how fast, Earl A. Gulbransen, Westinghouse Research Laboratories, Pittsburgh, is weighing oxide films, or rust, with a machine so sensitive it measures in weight units of 10 billionths of an ounce. Through this research, Dr. Gulbransen is seeking new ways to protect steels and other metals against the destructive action of oxygen in the air.

The special machine devised for this study is sealed in a glass tube to take measurements on pieces of metals half the size of a razor blade. Movements of the balance's pointer, so minute they can be observed only through a microscope, reveal the weight added to a tiny sample of steel by a single layer of oxygen atoms. One layer of atoms is about 10 billionths of an inch thick.

The balance, about 6 inches long and 1 inch square, is enclosed in one arm of a glass tube the shape of a cross 3 feet tall and 2 feet wide. The moving arm of the balance is a piece of quartz 6 inches long and $^1/_{16}$ inch in diameter. It is supported in the middle like a see-saw by a fine piece of tungsten wire which is stretched across a framework made of quartz. Quartz is used because it has less expansion than other substances when heated.

From one end of the moving beam the sample piece of steel is suspended on a 2-foot piece of tungsten wire inside the vertical part of the glass tube. A counterweight, with the same weight as the sample, is hung on the other end of the beam.

Dr. Gulbransen reads the weight of oxygen atoms with a microscope

99.8 Per Cent Pure Sponge Chromium Metal Produced

A form of sponge or powdered chromium metal that under certain conditions attains a purity of 99.8 per cent, higher than any chromium used in present commercial manufacturing, has been produced from both low- and high-grade domestic chromite ores through a process developed by metallurgists of the U. S. Bureau of Mines. Its high purity and powdered form render it valuable in manufacture of special steels, brass and bronze materials, and alloys subjected to high temperatures, such as electrical heating elements.

Successfully carried through the laboratory stage to a point where pilot-plant tests are justifiable, the new reduction process may permit utilization of a large amount of America's "off-grade" chromite ores at costs comparable to existing prices of low-carbon ferrochrome. Its future will depend chiefly upon the availability and cost of chlorine, the chemical used extensively in producing this new metallurgical material.

Low-temperature reduction without sintering is the basis of the process which consists of chlorination of chromite ores at elevated temperature, sublimation and separation of volatile chlorides, and reduction of chromium to metal by hydrogen. Sponge chromium of at least 99 per cent purity may be produced and, if specially purified chloride is used, the product may reach 99.8 per cent purity.

Methods and formulas are detailed in "Sponge Chromium" by C. G. Maier, 109-page technical bulletin 436, soon to be published. Copies will be sold at 20 cents each by the Superintendent of Documents, Government Printing Office, Washington, D. C.

Fatigue of Metals. Some Facts for the Designing Engineer. *D. Landau.* 45 pages. Paper cover. The Nitroalloy Corp., 230 Park Ave., New York, N.Y., 1941. Privately distributed.

THIS little booklet attempts to present to the designing engineer a brief résumé of the various factors concerned in the failure of metals owing to fatigue and the advantages to be obtained through the use of nitrided Nitroalloy steels.

The booklet is interesting reading, even for engineers not at the moment designing or implicated in the ever-recurring problem of metal failure. Landau begins with a general statement of the reasons and theory of fatigue failure, touches briefly on methods of data presentation and the trouble introduced by "stress-raisers" in metal specimens. The protection offered by the nitriding process is well explained, and many data are presented on corrosion protection and increase of fatigue limit of notched nitrided steels under the rotating beam test. There is a good discussion on overstress and, although nothing radically new is given in this booklet, it provides a fairly reasonable picture of the work being done in this field and is well worth the time necessary to read it.

The Principles and Practice of Beauty Culture. *Florence E. Wall.* 708 pages. Keystone Publications, 1659 Broadway, New York, N. Y., 1941. Price, $6.00.

THE introduction to this work contains the following paragraph:

> This book is the result of a serious attempt to draw from all the related branches of art and science whatever threads of knowledge constitute a requirement for, or a contribution to, beauty culture, and weave them all into the fabric of a new study, worthy of consideration on its own merits. It represents the accumulated findings of 16 years of research and practical experience in all phases of the vast business and industry of beauty culture.

The author has presented all this in a most comprehensive manner. Within the confines of 679 pages of text, there is set forth in logical sequence a vast amount of information on human physiology and the significance of cosmetology to every phase of the subject. The beautification of the person is not alone the application of creams, powders, deodorant, lipstick, nail polishes, etc., but the manipulative treatment of muscles, nerves, skin, as well as proper attention to the hair. To neglect any one phase is like building a house without a tight roof or with leaky walls or improper foundation.

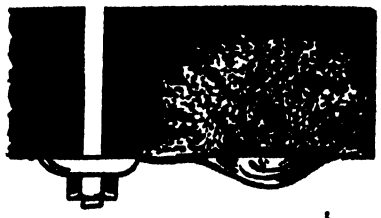
Twenty chapters, covering the main subject matter, follow this theme note; for instance, the nervous system is fully described and illustrated and in its proper place there is set forth the relation of massage to that important function of the physiological picture. In like manner, the functions of the muscles are discussed, the structure of the skin and hair, and the importance of the glandular processes appertaining to each. With all this as a foundation, it is a natural step to personal hygiene and the use of external procedures by hand and machine, facilitated by cosmetics applicable to the particular operation in progress.

By such means the author emphasizes what should be done to effect the proper attractiveness of the individual who seeks the art of the beautician. This is well illustrated in a chapter on hair make-up, where the right and wrong styles of coiffure are shown on features of different types.

Space is devoted to the chemistry and properties of various articles employed in the modern beauty salon and home dressing table. Manicuring is featured in detail, and the treatment of the hands and feet given due attention. About one fourth of the text is given over to detailed data on treating the scalp and hair by various types of waves as well as methods in vogue for bleaching and dying.

There is a chapter on shop management with an appendix on first-aid treatment in case of accident, and another chapter outlines the technique of advertising and selling cosmetics. There is a comprehensive bibliography and a good index.

One of the merits of this work is the simplicity of its style. It is devoid of unusual medical and bacterial terms, and can be read and comprehended even by one whose education may not have gone beyond high school.



As a guide to the instructor and a textbook for the student, it should have a place in educational fields directly or incidentally concerned with cosmetics and beauty culture. A brief history at the beginning should be found of interest to anyone whether student or general reader. From it we find that many of the arts practiced today with elaborate equipment and "unusual" chemical compositions are only adaptations of the methods employed, somewhat arduously perhaps, many centuries ago, but the success of which is attested in the masterpieces of sculpture, fresco, and painting that have withstood the test of time, weather, war, and pestilence through the ages.

H. C. FULLER

Tables of Numerical Data

ANNUAL TABLES OF PHYSICAL CONSTANTS, intended to bring out periodically numerical data of recent and current years on physicochemical properties of substances and materials and characteristics of physicochemical processes, have started publication in the United States, under the American Committee on Annual Tables appointed by the National Research Council and sponsored by a promoting board composed of leading personalities in science and industry. The issue for 1941, which is now appearing, is being supplied in installments of 32 pages on loose sheets printed by photo-offset. Its delivery is expected to be completed soon. The issue for 1942, in preparation, will be available in the second half of this year. The 1941 installments now appearing include sections dealing with current properties of selected pure organic compounds, such as freezing-melting temperatures, boiling temperatures, densities, viscosities, surface tensions, vapor pressures, specific heats, refractive indexes, and dispersion. They cover the 15 years' period from 1926 to 1940. Several other topics, to cover also inorganic substances, materials and systems, are scheduled for publication in the 1942 issue.

The general plan of the undertaking, which continues both the former European series of Annual Tables and the International Critical Tables and is to supplement the latter, includes both tables by properties and, at a somewhat later stage, a card-file by substances. Annual Tables are a unique tabular work of constants and should prove to be a very helpful auxiliary tool of research. In realization of the need for up-to-date tables of numerical data, many members of staffs in universities, colleges, and research laboratories have volunteered to contribute, within the limits of their possibilities, to the task of assembling and editing data pertaining to their respective fields of work and interest. Leading industrial corporations have consented to provide financial support and thus have once more shown them-

Determining Steam Purity by Conductivity Methods

THE technical papers and discussions comprising a Symposium on Problems and Practice in Determining Steam Purity by Conductivity Methods, which were presented at the 44th annual meeting of the American Society for Testing Materials in Chicago, June 26, 1941, have now been reprinted from the *Proceeding of the American Society for Testing Materials* as a separate. This symposium represents the work of A. S. T. M. Committee D-19 on Water for Industrial Uses. The papers of the symposium follow an introduction by R. E. Hall and discuss The Sampling of Steam and Boiler Water, Experimental Methods for Determining Conductivity Corrections for Dissolved Gases in Steam Condensate, Calculation of Corrections to Conductivity Measurements for Dissolved Gases, The Degasification of Steam Samples for Conductivity Tests, A New Type of Conductivity Apparatus for Use with Boiler Waters and Steam Samples, and Conductivity Cells and Electrical Measuring Instruments. A combined bibliography on steam purity, including some 75 important references, concludes the book.

A copy of the publication in heavy paper binding may be obtained from the American Society for Testing Materials, 260 South Broad St., Philadelphia, Penna., at 60 cents a copy.

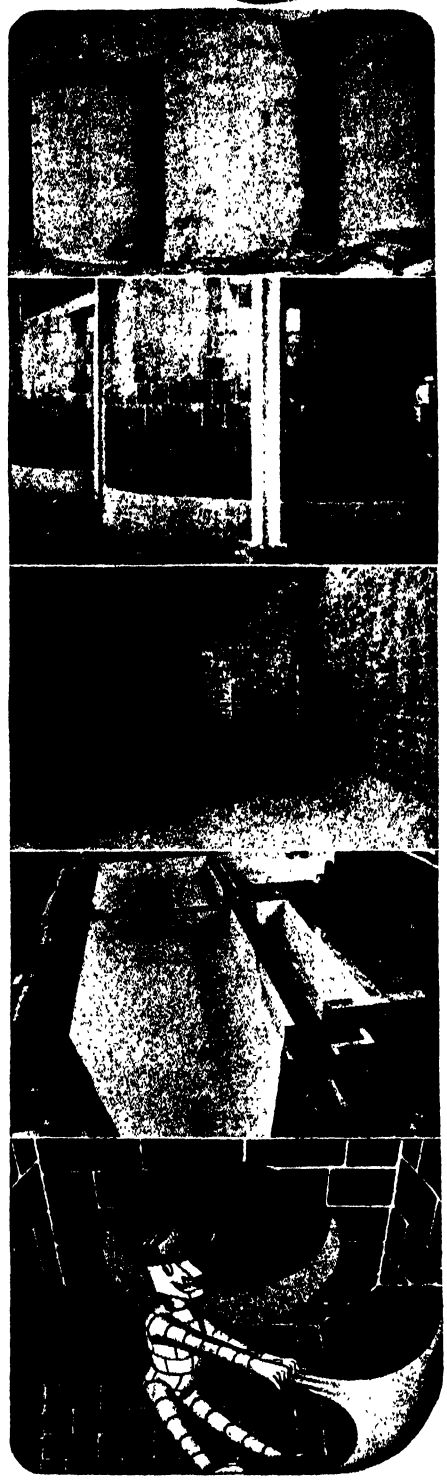
Directory of Corrosion-Preventive Technologists

THE American Coordinating Committee on Corrosion is contemplating revision of its confidential directory of technologists actively engaged in studies on corrosion and its prevention. The committee comprises delegates from 17 major technical societies together with representatives from the principal industrial research institutes and the National Bureau of Standards. Its directory currently lists some 400 investigators in a diversity of corrosion-preventive fields selected on the basis of questionnaires circulated to the membership of the committee's member societies. While it is felt that the directory list is quite complete, there are undoubtedly individuals who were not reached in the original circularisation. Accordingly, the committee now requests all persons actively engaged in corrosion

researches who have not been contacted to write the secretary, G. H. Young, 4400 Fifth Ave., Pittsburgh, Penna., for further details and application forms for directory listing.

Specifications

TESTING in Modern Industry", featuring conversion tables and specification standards for textiles, chemicals, metals, and other materials, has been published by the United States Testing Co., Inc., Hoboken, N. J. The 105-page book is being distributed to the company's clients. The first book of tables was issued some 40 years ago and has since been revised many times.



Oil Industry to Study Speeding Butyl Rubber Production

TO SPEED the Government's synthetic rubber program, W. S. Farish, president of Standard Oil Co. (New Jersey), at a meeting of the Petroleum Industry War Council requested appointment of a committee representing the entire oil industry to study the problem of butyl rubber in cooperation with the Petroleum Coordinator. The committee, to be appointed at once, will make recommendations on the best methods for promoting the manufacture of butyl and for utilizing it—with other synthetic rubbers—to the greatest possible extent in the present rubber shortage. The committee was empowered to act without reporting back to the council.

The Government's present 700,000 ton synthetic rubber program, announced by Jesse Jones, Secretary of Commerce, includes 60,000 tons annually of butyl, to be made by Standard. The first butyl output should be ready in November and will come from the $4,500,000 plant at Baton Rouge, La., on which Standard began construction with its own money in August 1941. Partly as the result of the consent decree which it accepted last month and partly as the result of voluntary action by Standard Oil Co. (New Jersey), producers of butyl will be licensed to use these patents royalty-free during the war and under reasonable royalties, to be fixed by the Government, after the war.

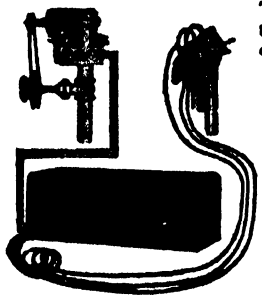
Butyl rubber, a development of the Esso Laboratories, is the lowest cost synthetic rubber so far produced. Tire companies who have done the chief experimenting with it say they can make butyl tires capable of running 10,000 miles at speeds up to 35 miles an hour. It is more capable than natural rubber of retaining air under pressure, so that it should produce superior inner tubes when present difficulties of commercial manufacture have been overcome. Components of butyl rubber are taken entirely from the petroleum industry.

STEBBINS Quality LININGS & TILE TANKS

. . . . provide process plants wherever acids, alkalies, corrosive or non-corrosive liquids, gases or vapors are encountered, with an efficient, economical, long-lived and trouble-free installation.

Where sludges, brines, bleaching solutions, process water, pulps, dust, salts, granular products, etc., are to be stored, the new STEBBINS tile tank can be installed without waiting.

Fifty-eight years' experience in meeting specific operating conditions in a great many process plants has provided STEBBINS with one ingredient that is vital today—KNOWLEDGE.



To know how to do a first-class job—saves TIME. Ask STEBBINS when you have a lining or tank problem.

Normal Human Plasma for War Needs Sealed at High Rates

A NEW enterprise is drying blood plasma, sealing it in an evacuated "vipule" (glass flask stoppered like a vial and sealed like an ampoule), and packing it with another vipule of sterile water, a hypodermic needle, and other necessities for emergency use in war zones to promote healing where blood loss has been excessive. The Reichel Laboratories, Kimberton, Penna., have cooperated with the American Red Cross to prepare donated blood for the Allied armed forces.

The Reichel Laboratories use bottled propane for fuel, and to get consistently proper glass-working flames under pressure for fast sealing was found to be difficult by ordinary fuel-handling means. Accordingly, a small positive-displacement compressor and automatic fuel-air proportioning valve was installed. This unit, a Type J Selas combustion controller, reduces the propane to atmospheric pressure and intermixes it with the filtered air required for combustion, in constant ratio irrespective of variations in fuel pressure, rates of demand, or atmospheric conditions. It delivers the resultant carbureted fuel to refractory-tip jets, at a constant pressure of about 1.5 pounds per square inch. As a result, evacuated vipules of plasma (after centrifuging, pooling, freezing, and drying *in vacuo*) are now conveniently sealed at a rate of between 3 and 4 per minute per operator.

The vipule rotates on a small brass turntable until the glass has softened to the proper point, at which time the operator manipulates the seal.

Left. Small positive-displacement compressor and automatic fuel-air proportioning valve. *Below.* Operator manipulating the seal after the vipule has rotated on a brass turntable until the glass softened to the proper point.

Patents Granted

CELANESE CORP. of America has been granted two patents—2,278,537 relating to the manufacture of ketene and acetic anhydride and 2,278,540 relating to titanium oxide pigments.

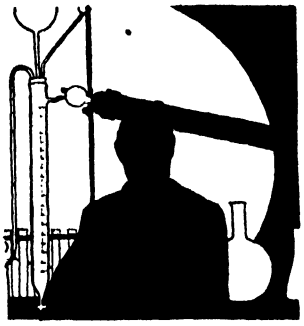
Branches in all Principal Cities



Years of use have shown the Parr Glass Blowers Goggles to be a dependable safeguard for eyesight in many applications. They effectively reduce the sodium glare which is present in various heating operations such as brazing, silver-soldering, cyanide case-hardening and, of course, glass blowing.

Although these goggles act as a barrier for sodium light, actually they are quite transparent and will allow the free passage of 41 per cent of ordinary daylight. As a result the wearer does not have to remove the goggles in order to see in detail objects other than the heated work, such as blueprints, instruction sheets and tools.

In the interests of better sight and better apparatus every laboratory should possess at least one pair of these goggles.

Write for Bulletin E-59 for details.

Cleveland, Ohio, and Principal Cities

Junior Chemists Needed in C. S. Positions

THE United States Civil Service Commission is seeking junior chemists at $2,000 a year. No written test is required.

Women especially are urged to apply. Completion of a 4-year course in a recognized college with 30 semester hours in chemistry is required. No experience is required, and there are no age limits. Applications must be filed with the Civil Service Commission, Washington, D. C., and will be accepted until the needs of the service have been met.

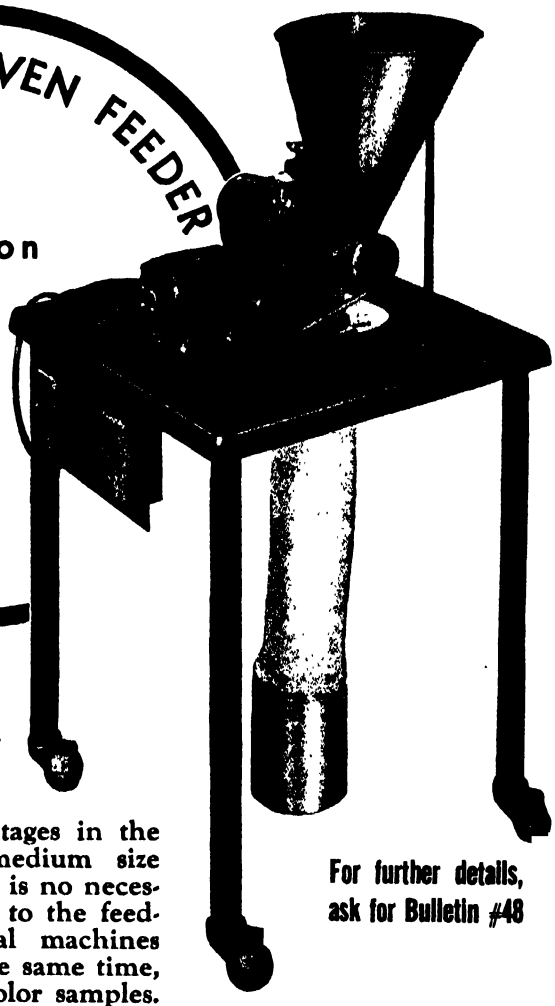
Use of Benzene in Industry

CONTRARY to allegations made in two recent newspaper articles, no prohibition against the use of benzene in industry exists in the laws or regulations of the State of New York, according to Industrial Commissioner Frieda S. Miller.

The first of these articles pointed out that benzene is suitable for industrial use "but is now barred by state regulations, which vary rather widely, are not present in some states, and are particularly stringent in New York, New Jersey, and Massachusetts".

The second article was more general and indicated that antibenzene regulations are in existence, that they require relaxation, and that "in many instances benzol can be substituted for toluol, but is forbidden by state regulations". From this second article it would also appear that in New York State the use of benzene is forbidden and that an appeal procedure is necessary to permit its industrial use.

Commissioner Miller said:



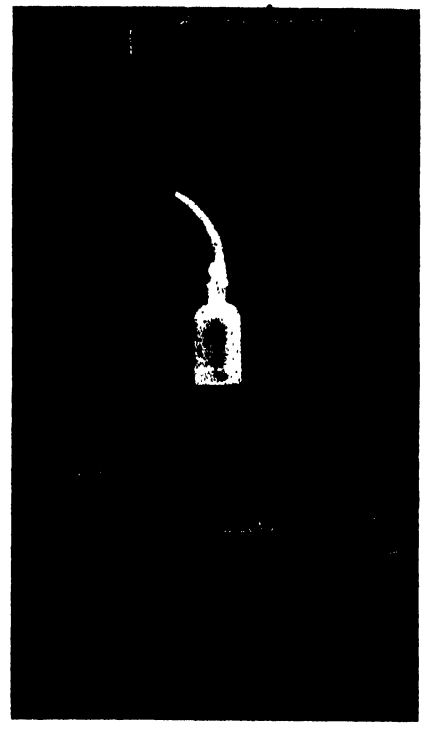
There are no regulations in the States of New York, Massachusetts, or New Jersey which forbid the use of benzol in industry. In New York State the use of this material is safeguarded by the general requirements applicable to all potentially toxic substances. The law calls for the maintenance of conditions which do not "tend to injure the health of the worker". In Massachusetts the only legal requirement is that benzol containers must be labeled. This latter State recommends a limit of 75 parts of benzol per million of air, but only in an advisory manner for guiding the users of this material. The New Jersey statutes require that workers be not exposed to concentrations in excess of 100 parts of benzol per million parts of air.

The American Standards Association, through one of its committees of experts, has recently promulgated a maximum allowable concentration of 100 parts of benzol per million parts of air.

It would appear that the legal requirements in the States of New York, New Jersey, and Massachusetts agree very well with the American Standards Association requirements and one wonders why there need be any confusion in the minds of persons interested in this subject. Certainly the facts are exceedingly clear and simple.

MOTOR DRIVEN FEEDER

. . . available on the Raymond LABORATORY MILL



The *motorized feed type* of Raymond Laboratory Mill with variable speed control offers particular advantages in the continuous grinding of medium size batches of material. There is no necessity of constant attendance to the feeding operation, and several machines may be kept running at the same time, as in pulverizing various color samples. An extra large hopper is furnished, supported by a table brace. The complete unit comes mounted on a metal base with corner sockets for pipe legs. The standard type of Raymond Laboratory Mill with *hand-operated feeder* is also available and is recommended for most purposes where a few pounds of material are ground at a time.

NH_4Cl Tube

This photograph of a 250-ml. reagent bottle containing hydrochloric acid shows a deposition of ammonium chloride in the shape of an irregular tube about 15 to 20 cm. long and about 1 cm. in diameter at the top. This phenomenon was photographed by George J. Benoit, Jr., Department of Chemistry, University of Washington, Seattle.

Double Walled *Hazard-Safe*

Ventilation Control

Brand New Precision Thelco No. 16

Automatic Temperature Control from Room to 150° C

$85.

Working chamber 11" x 11" x 11". Sensitivity Plus or Minus ½° C. Overall dimensions 16½" wide, 16" deep, 25" high. Includes 2 latticed metal shelves adjustable for height on 3 sets of brackets to permit pulling half-way out; thermometer holder; ventilating shutter, hazard-safe door latch, Neon pilot lamp, cord and plug. For A. C. single phase, or D. C. Wattage, 300. Specify voltage—see below.

Exemplifying construction characteristics heretofore restricted to constant temperature equipment at much higher price levels, this new all-metal Thelco offers a new measure of dependable performance.

More than 30 years of heat-transfer engineering is responsible for the fact that this is the finest oven in the moderate price field.

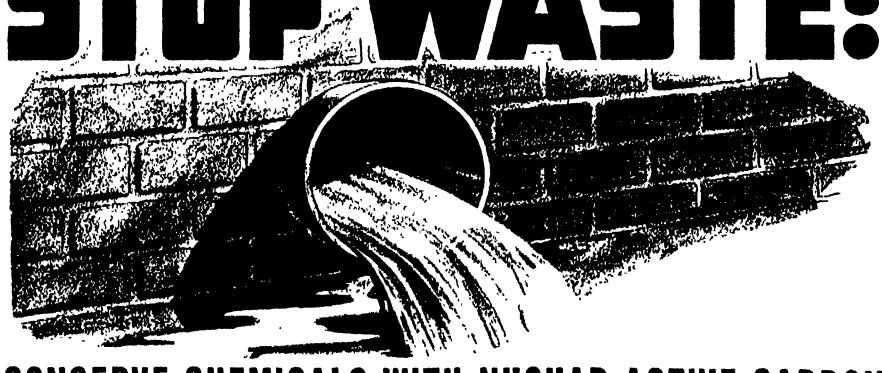
General Refractories Co.	1,159,065	1,268,775	2.46	2.70
Mead Corp.	1,426,881	2,109,784	1.56	2.66
United Gas Improvement Co.	27,794,622	21,776,714	1.03	0.77
U. S. Gypsum Co.	7,052,974	7,033,629	5.44	5.42

According to the *Wall Street Journal*, a new high in output of chemicals, spurred by the war, was recorded in February. The Federal Reserve Board unadjusted index of such production reached 157 in February (1935–39 average, 100), compared with 153 in January and 124 in February 1941.

Whereas 1941 was an extraordinarily good profit year for the rubber industry, manufacturers are gradually converting to production of goods other than rubber, mostly defense products, including ammunition, TNT, airplane parts, etc. It is expected that 1942 profits will be lower than 1941 in most cases.

The Carrier Corp. reports that orders booked during January were the second largest in the history of the company, 94.8 per cent being war orders. February 1942 business ran almost three times as large as February 1941.

The Dow Chemical Co. and subsidiaries report net income of $6,322,592 for the nine months ended February 28, 1942, equivalent to $4.88 per share on common. Taxes were provided in the amount of $5,632,873. During the period $2,107,475 was charged for the amortization of completed emergency plant facilities covered by certificates of necessity.



The Foster Wheeler Corp. is proposing to stockholders a recapitalization which provides for the issuance of six shares of new 6 per cent $25 par prior preferred stock and two shares of common for each share of the present $7.00 preferred. Since 1937 the company's business has expanded greatly, and in the past three years earnings have been approximately $2,525,500. Of this about $1,300,000 was spent for plant expansion and the remainder was used for working capital and payment of preferred dividends since January 1, 1941. It is hoped that the recapitalization will afford appropriate consideration to preferred stockholders and put the common stock in line for dividends.

During 1941 the **Freeport Sulphur Co.** was called upon to supply the largest tonnage of sulfur in its history. During the year the **Cuban-American Manganese Corp.** expanded its concentrating plant near Santiago by 30 per cent.

Production of nickel by the **International Nickel Co.** reached a new high record in 1941 and mines and smelters ran continuously, largely on a 24-hour basis. The company has under way an extensive program to increase production, so that by 1943, 50,000,000 pounds more than in 1940 will be produced.

The 1941 business of **Parke, Davis & Co.** was substantially the largest in its history, but higher costs of material and labor and sharply higher taxes materially affected earnings. The research laboratories have been expanded and altered, and investigative work is proceeding more vigorously than before.

STOP WASTE!

CONSERVE CHEMICALS WITH NUCHAR ACTIVE CARBON

In normal times, the Chemical Industry allows millions of dollars' worth of valuable chemicals to flow to the sewer because the cost of reclaiming them is too high to be considered.

However, with our war effort in full swing, there is an ever-growing shortage of chemicals; with even some of our most common heavy chemicals on the critical list. Therefore, it is becoming necessary to conserve chemicals and many chemical manufacturers are now finding it both practical and economical to reclaim acid, alkali, dye and other liquors by treatment with NUCHAR Active Carbon.

If the impurities can be removed by adsorption, the use of NUCHAR Active Carbon provides a simple, low-cost treatment. Investigate the possibilities of this treatment for the reclamation of your process liquors.

NUCHAR INDUSTRIAL CHEMICAL SALES

DIVISION OF WEST VIRGINIA PULP AND PAPER COMPANY

230 PARK AVE. NEW YORK, N.Y.

The Union Carbide & Carbon Co. reports construction expenditures during 1941 of $59,797,720, nearly all for capacity important to war work. Earnings before taxes and other deductions showed a gain of more than $23,000,000, but net income showed a slight decline.

The factories of the Victor Chemical Works are operating at capacity, and sales for the first two months of 1942 showed an increase over the similar period of 1941. Taxes in 1941 took 46 per cent of taxable income. The $1,250,000 realized from sale of stock had been used to pay off bank indebtedness of $750,000 and the remainder was used for general capital purposes.

Electrolytic Process for Tin-Plating Strip Steel

BOTH tin and electric power will be conserved by a faster, more economical electrolytic process for plating strip steel with tin, announced by the Electroplating Division of E. I. du Pont de Nemours & Co., Wilmington, Del. This halogen tin process employs a neutral solution which is said to eliminate sludging and the consequent waste of tin common to many electrotinning methods.

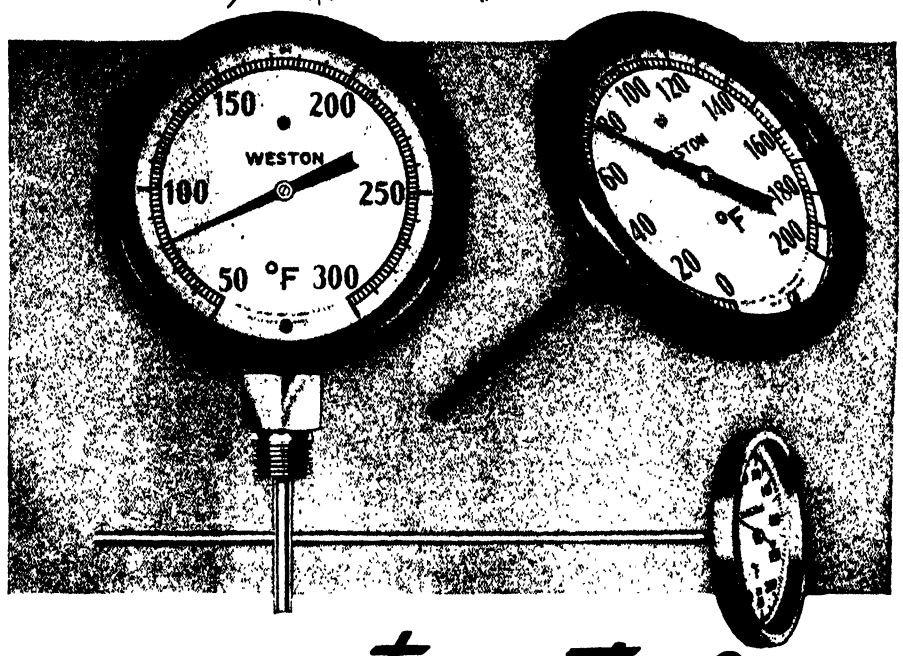
Strip steel for containers can be tin-plated twice as fast with less electric power by this process as by the "alkaline" electrotinning method, thereby reducing substantially labor and power costs. A thinner, more uniform coat of tin can be applied to strip steel electrolytically than by the conventional "hot dip" method, resulting in savings of from 40 to 65 per cent of the tin used.

A larger percentage of tin cans henceforth will be plated by electrolytic processes because the War Production Board has limited drastically the amount of tin for containers, and thin coatings of the metal will be necessary.

Tin deposited by the halogen process, it was said, can be heated without discoloration either when tin plate is heated to obtain the bright finish required by some can manufacturers or when treated during the process of applying lacquers or enamels.

High-Temperature Condensate Return

AT THE Pierce-Roberts Rubber Co., Trenton, N. J., 32 vulcanizing presses are in constant operation in the manufacture of gaskets, washers, and miscellaneous mechanical rubber goods. Steam is supplied the presses at 120 to 125 pounds per square inch. The condensate return system evacuates the molding presses at 85 pounds per square inch. Previously, the returning condensate flashed in an open hot-well was in a large measure wasted, and the heat from the 5-pound exhaust of a compressor engine was completely wasted to atmosphere. Now the high-pressure condensate is returned by the system of the Cochrane Corp., Philadelphia, Penna., direct to the boiler at a temperature approximating 325° and the 5-pound compressor exhaust is completely utilized in heating makeup.



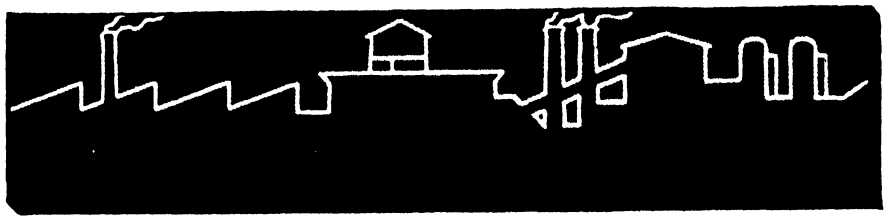
Blackout Controls

PHOTOELECTRIC illumination blackout controls, developed by Photoswitch, Inc., 21 Chestnut St., Cambridge, Mass., present a method for permitting illuminated displays to remain in operation where blackout regulations are in effect. Switches are aligned with the nearest street lamp, and automatically turn off the illumination when the lamp is turned off.

Metal Lead Primer

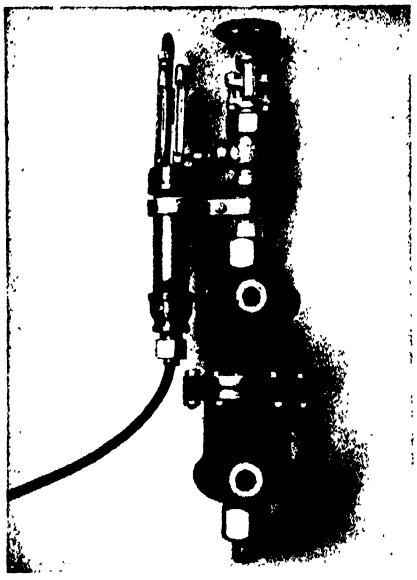
AS AN alternative to aluminum paint priming, The Midland Paint & Varnish Co., Cleveland, Ohio, offers a metal lead primer which is claimed to be equal to a good grade of aluminum paint. Hyspar metal lead primer is said to be rust-inhibiting, and may be brushed, sprayed, or dipped. It dries hard in 4 to 5 hours.

RUGGED ALL-METAL CONSTRUCTION CUTS BREAKAGE COSTS!



WESTON ALL-METAL *temperature Gauges*

Today it takes real ruggedness to withstand the mechanical abuse around the active plant. That's one of the reasons why more and more plants are installing WESTON Temperature Gauges. Their all-metal construction eliminates much of the common breakage, thus safeguarding against frequent interruptions and replacement costs. In addition to ruggedness, however, WESTON all-metal Temperature Gauges also provide the advantages of *pointer reading*. Their large, dial-type scales can be read accurately from a distance, and they can be mounted at any angle most convenient for easy reading. Available in types, sizes, stem lengths and ranges for most industrial applications. Accuracy guaranteed within 1% for the industrial types . . . ½ of 1% for the laboratory type. The coupon below will bring complete information.



Weston Electrical Instrument Corporation
660 Frelinghuysen Ave., Newark, N. J.
Please send complete literature on WESTON Temperature Gauges.

Condensate Sampler

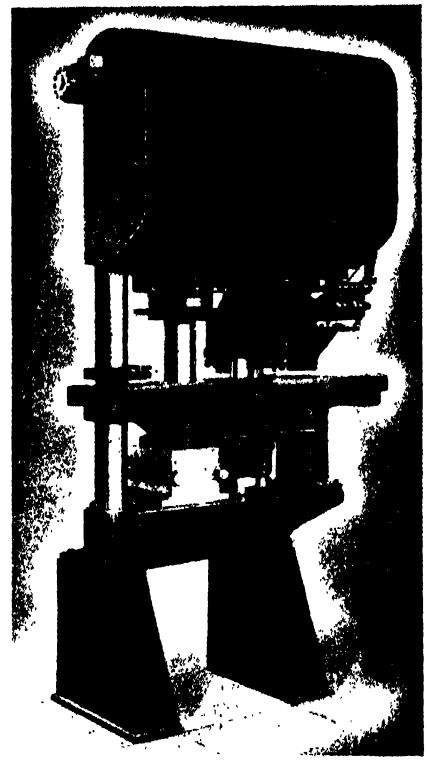
A CONDENSATE sampler for the electrical-conductivity checkup is announced by Industrial Instruments, Inc., 156 Culver Ave., Jersey City, N. J. This device operates in conjunction with a suitable electrical instrument calibrated in direct-reading terms, such as percentage of carry-over of soluble salts. The well-known solu-bridge or the relay-operating solu-bridge controller for actuating a warning signal or corrective means may be used with the condensate sampler.

The cell holder admits the condensate into a chamber provided with a baffle and a two-way drain cock. At the bottom of the chamber is the conductivity cell. A thermometer indicates the temperature of the condensate, a vital factor in accurate conductivity readings. A sight gage indicates the presence of oil which can be drained off, safeguarding the conductivity cell against contamination. The conductivity cell holder may be connected with any suitable condenser.

New Dispersion Process

A NEW method of mixing through the use of air streams to disperse liquids and solids has been announced recently by the Pneumatic Dispersion Division of the Great Lakes Carbon Corp., 22 East 40th St., New York, N. Y.

The new process, said to produce complete, uniformly homogeneous mixtures, uses compressed air to inject streams of solids and liquids, fed from separate storage tanks, into a large mixing chamber where the two substances are intimately dispersed by the turbulence of the released compressed air. From the mixing chamber the materials drop into vertical hoppers underneath the mixer and then travel through a pneumatic system to cyclone separators where the particles separate from the air stream and are removed for further processing. The blend comes from the cyclone in the form of a dry powder easily handled. The new dispersion process, it is claimed, will yield a dry product even though the final mixture contains as much as 50 per cent liquid.



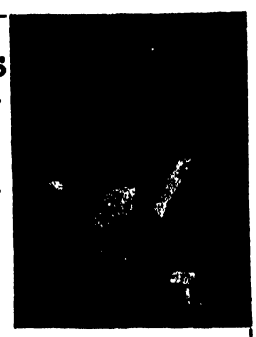
Among the advantages listed for the pneumatic system are mixing in any desired proportion, low-power requirements, mixing of any powder or dust that can be atomized, and low investment in equipment. A booklet, describing the Pneumatic Dispersion process, is available from the Great Lakes Carbon Corp.

Glue Shortage Partially Relieved by Chemical

ANIMAL glue, the critically scarce adhesive used in making tubular shell containers, ammunition boxes, and similar products, can be made to go almost twice as far by the use of Arlex, trade name of commercial sorbitol solution, according to the Industrial Chemicals Department of Atlas Powder Co., Wilmington, Del. The addition of a small amount of Arlex to glue mixes, it is claimed, not only gives glues nearly twice the coverage, but also makes possible the use of certain relatively more available grades of glue.

Because of reduced imports and greatly increased usage, certain types of animal glue are almost impossible to procure. Modern glues have long been standardized and unpublicized components of scores of industries. Available domestic supplies were closely related to slaughterhouse activity, but imports, in the past were readily available to make up any deficit needed to meet demands. However, since imports have been curtailed and domestic needs have increased, "extenders", or materials to make glue go further, are urgently in demand.

Extrusion Press



AN IMPROVED 125-ton extrusion press which permits simultaneous loading and extrusion has been developed by The Watson-Stillman Co., Roselle, N. J. The first of these units will extrude carbon mixtures but the press is also suitable for extruding any plastic material.

The press has two containers, mounted on a swinging arm. Operator starts the automatic extrusion cycle by push-button control, then devotes undivided attention to loading the free container. The container arm is provided with lifting cylinders for easy swinging and with hold-down

Read AIR VELOCITIES
INSTANTLY DIRECTLY ACCURATELY
with this
"Alnor" VELOMETER

Ruggedly constructed—expertly calibrated—the "Alnor" indicates air velocities directly on a scale in feet per minute without timing or calculation. This Velometer will also indicate pressures in inches of water when provided with suitable jets. Accuracy within 3% of full scale readings guaranteed. Range includes 15 to 24,000 F.P.M.

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

CROLL-REYNOLDS CO.

cylinders to seal container against die during extrusion.

Air Conditioning Reduces Time for Tanning Leather

TIME required to tan leather for the use of the United Nations has been cut by two weeks through the use of air-conditioning equipment in the plant of the largest leather processing firm in Bogota, Colombia, according to Carrier Corp., Syracuse, N. Y.

Empresa Colombiana de Curtidos, S. A., reports that goat, cow, and sheep hides taken from the tanning rooms had required from 10 to 18 days to dry depending on the vagaries of the weather. Today, under weather conditions controlled by air-conditioning equipment, drying time has been cut to less than one day. As a result of the time saved, the Bogota firm has ordered an extension of the system installed by Uribe, Garcia Alvarez y Cia, distributors in Colombia for Carrier Corp.

Tube Turns Opens Houston Office

ON APRIL 1 Tube Turns, Louisville, Ky., opened a branch office in Houston, Tex., which will be managed by W. B. Whenthoff, formerly in charge of the office in Tulsa, Okla. W. E. Geiser has been made district manager of the Philadelphia office in the Broad Street Station Building.

Insulating Varnish

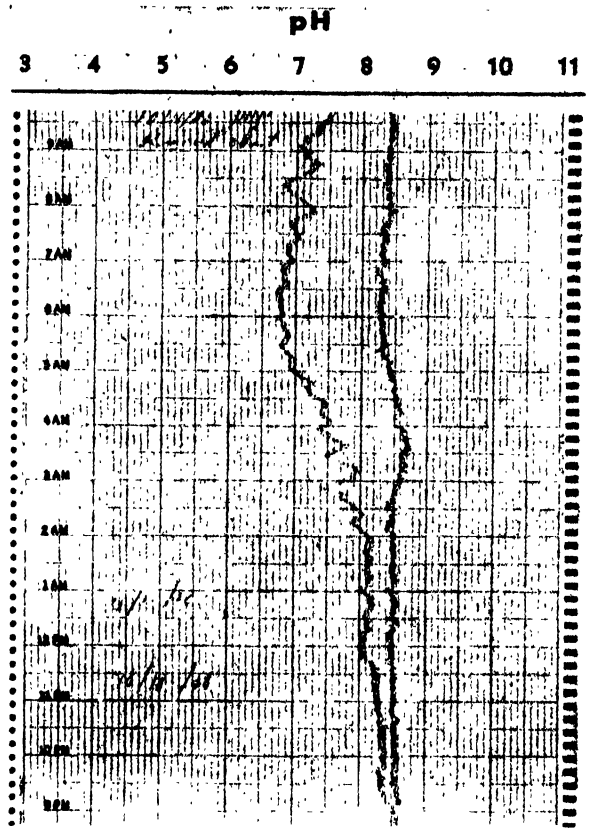
THE Sterling Varnish Co., 140 Ohio River Blvd., Haysville, Penna., has developed an insulating varnish, S-110, for application to electrical apparatus that must operate at abnormally high temperatures. Tests have indicated that S-110 will stand operating temperatures at 250° C. or higher.

When baked at 175° to 200° C. it dries all the way through the deepest winding and does not resoften when exposed to high operating temperatures. The dried film is mechanically strong, exceptionally adhesive and flexible, and retains these characteristics under adverse heat conditions.

Colonial Plastics

COLONIAL V PLASTICS, offered by the Colonial Alloys Co. (Chemicals Division), Philadelphia, Penna., have applications for both war and essential civilian needs, and are said to be made of materials that are plentiful and readily obtainable. They have a wide range of uses as alternates for rubber, copper, tin, aluminum, Monel metal, stainless steel, and other materials, in the shape of threads, tubes, rods, and sheets, and as extrusions from flexible to rigid grades.

HANOVIA FUSED QUARTZ MERCURY ARCS



High Intensity Ultraviolet Radiations

POWERFUL:	Available in many types with luminous arc lengths of 1 1/2 to 59 inches and with an input of 100 to 4500 watts.
VERSATILE:	Provides radiations over the complete spectral range of the high pressure quartz mercury arc.
STABLE:	Loses only a little intensity in hundreds of hours of use.
CONVENIENT:	Lights automatically when power is applied and operates equally well in any position.
EFFICIENT:	Converts a high percentage of electrical energy to useful ultraviolet radiations.
ECONOMICAL:	The burner envelope is made of the finest grade of transparent fused quartz insuring maximum light transmission.

HANOVIA CHEMICAL & MANUFACTURING CO.
Dept. 351
Newark, N. J.

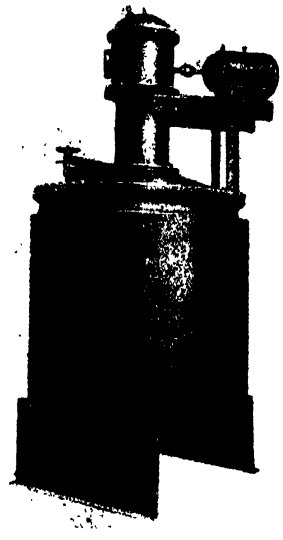
Multi-Point pH Recorder

A NEW pH recorder which will indicate pH values at separate and independent points in a fluid-flow system and record the values simultaneously on a single chart has been announced by the Cambridge Instrument Co., 3732 Grand Central Terminal, New York, N. Y. The new instrument provides a continuous picture to the control operator of the conditions throughout the plant and gives a rapid check on the effectiveness of processes and introduced changes.

The illustration shows a record from the condensate system of a large utility generating plant, where such guidance has helped to solve the problem of turbine blade deposits. The chart shows the change in pH of a condensate system before and after deaeration. The left line indicates the pH before treatment, while the right line is taken after the condensate leaves the deaerating chamber. This new development is of interest not only to power plant operators but to engineers in the process industries where far-reaching economies may be influenced by the pH at different stages in a process or treating operation.

The new instrument is conventional in appearance but incorporates an advance in circuit design which permits installation of measuring electrodes at separate and independent sampling points in the plant.

It is expected that the new instrument will find use in many industrial plants where pH control is important, such as the brewing industry where pH control of ingredients helps regulate the acidity of the final product, and the paper industry may use the instrument for pH control in cooking, bleaching, sizing, and water purification and to correlate the pH readings at various mill points. Other contemplated users are the textile processors for wool-processing control, the oil refineries where control of neutralization reactions are important, and in sugar refineries for control of clarification and colloidal precipitation.

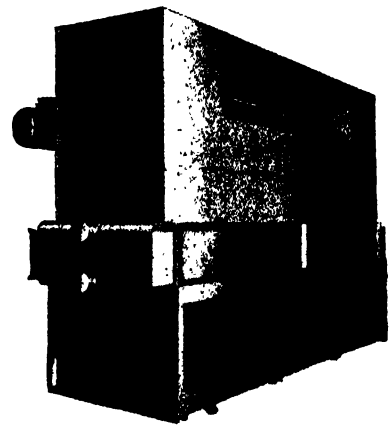


Watt-hour Meter Controls Electroplating Current

A NEW use for the ordinary watt-hour meter is to provide an accurate and refined control of the current used in electroplating permanent magnets at the Westinghouse Newark works of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Penna. The cost of the unit is less than that of the ampere-hour meter commonly used, and expensive and cumbersome shunts across the plating electrodes are eliminated.

The watt-hour meter may be placed on a switchboard some distance from the plating tank, whereas in the case of the ampere-hour switch it is necessary to place the shunt near the plating tank in the heavy output lead.

Mixer for Heavy Materials



A RECENT development by L. O. Koven & Bro., Inc., Jersey City, N. J., is a special unit which incorporates in one mixing tank three means of agitation to produce completely homogeneous diffusion, kneading, blending, and absorption in viscous masses or thick compounds. The container is an all-welded tank with dished bottom. An outside jacket, as illustrated, may be provided for heating or cooling the product during the mixing process. The cover, gasketed and bolted to the tank, is provided with a manhole which can be opened quickly. The outlet valve at the concave bottom may be any type best suited to permit quick flow of the mixture.

The agitating mechanism consists of a vertical shaft, the upper terminus of which is coupled to a speed reducer driven by a motor. A three-blade ship-type propeller is mounted on the shaft halfway down its length in the tank but can be adjusted to any other desired depth. At the bottom end of the shaft is a turbine-type impeller. The tank itself has four baffles projecting radially in four quadrants along the cylinder but mounted several inches from the wall. Rotation of the propeller causes the material to be sucked down toward the turbine which, because of the pitch of its blades, gives the material a combined peripheral and upward motion. As some of the material strikes the baffles it is turned back with a rotary kneading or turnover action. At the same time some of the material flows between the baffle and cylinder which gives it a shearing effect.

Quenching Oil Cooler

A QUENCHING oil cooler has been developed by the Trane Co., La Crosse, Wis., for industrial applications calling for the quenching process of hardening steel.

The unit utilizes the atmospheric evaporative principle, and is ordinarily applicable where the use of large quantities of water is uneconomical, where water quantity is insufficient, where water temperature is too high, where it is not necessary to maintain quenching bath temperature below 100° F., where water has corrosive properties or is dirty, and where the water supply may fail.

Profit-Sharing Bonus Paid to Fairbanks-Morse Employees

FAIRBANKS, MORSE & Co., Chicago, Ill., has paid $426,160.73 as a bonus to factory and office employees, exclusive of salesmen, branch house managers, and others who are on bonus contracts. The amount paid as profit-shares equals 4.314 per cent of each employee's annual wage or salary for 1941. This is the fourth year the profit-sharing arrangement has been in effect.

THE Metallizing Co. of America has removed its Chicago general offices and midwestern warehouse to 1330 West Congress St., Chicago.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ——▶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

GRADUATE ASSISTANTSHIPS, Chemical Engineering, University of Rochester, beginning September 1, completing M.S. program in one year. Stipend $700 plus tuition. Request further information or apply by sending complete personal data, photograph, transcript and two reference letters to Howard S. Gardner, Dept. of Engineering, University of Rochester, Rochester, New York.

CHEMICAL ENGINEERS. Positions open for young M.S. or B.S. well grounded in chemistry or chemical engineering for development work with major oil company. Applicant should submit details concerning education, scholarship, experience, personal data, references, and recent photograph. State salary expected.
54-N-4, Ind. & Eng. Chem., Easton, Pa.

COLLOID CHEMIST, Ph.D. and several years' experience in this field. Particular consideration will be given to a man with knowledge of surface chemistry. Knowledge of organic chemistry desirable. In reply give full information regarding training and experience, draft status and salary that you would consider. Mid-western location.
Box 60-NP-4, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIP in woman's college of southern university. Work for M.S. degree. Qualifications: B.A. or B.S. with adequate training in physics and mathematics as well as in chemistry.
Box 99-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED: experienced in manufacture of Hydrosulfites, Eastern location.
Box 19-T-4, Ind. & Eng. Chem., Easton, Pa.

HEATING & VENTILATING Position open for graduate engineer with experience in the design, installation and operation of industrial air conditioning and process air handling (drying, etc.). Chemical background desirable. State age, salary expected, etc.
Box 28-TP-4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST or Engineering Physicist with recent B.S. or M.S. North Philadelphia suburb. Must have good knowledge of use of microscopes, knowledge of spectrographic work, X-ray, electron diffraction, surface area measurements, electrical quantitative measurements desirable. Mostly research work. Reply giving full details in first letter on education, experience, personal data, availability, references, salary expected and draft status. Enclose full length recent photo. Gentile only.
Box 29-TP-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, American citizen, wanted for sales training in highly specialized technical field. Location, New York City. State age, draft status, education, experience and salary record. Enclose photo. Replies considered confidential.
Box 30-T-4, Ind. & Eng. Chem., Easton, Pa.

A LARGE pharmaceutical manufacturer is seeking a person to serve, after adequate training, as administrative manager of a manufacturing plant. In addition to a broad background in organic and pharmaceutical chemistry, he must have executive ability. Send a statement of education, experience and qualifications.
Box 71-TP-4, Ind. & Eng. Chem., Easton, Pa.

POSITIONS OPEN: (1) Organic chemist, Ph.D. as research assistant. (2) Chemist familiar with micro-analytical procedure. Well known research institute in the west. Give complete personal data including education, experience, references, nationality, and recent photograph.
Box 42-T-4, Ind. & Eng. Chem., Easton, Pa.

CREAM CHEMIST or practical experienced man who will do actual manufacturing of creams and allied products for private label cosmetic manufacturer. Young man not subject to draft preferred. Permanent position. Location Newark, N. J.
Box 46-TP-4, Ind. & Eng. Chem., Easton, Pa.

FERMENTATION CHEMIST. Experienced man wanted for industrial research on fermentation; industrial alcohol background desirable. Please give complete details, including experience, salary desired, etc.
Box 49-TP-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED: Unusual opportunity with an aggressive, successful New England company devoting an exceptionally large proportion of its activities to laboratory and research work. Man desired should have several years' experience and creative flair for solving finishing problems—knowledge of pigments, shellac, casein and similar materials. Not necessary that he be a graduate chemist if capabilities are proved. Must be 3A draft exempt. All communications will be held in strict confidence.
Box 53-TP-4, Ind. & Eng. Chem., Easton, Pa.

WOMAN ANALYST. Experienced woman analyst wanted at once by industrial laboratory in southern New England. Work consists mainly of analysis of baking powders, baking powder materials, phosphates, phosphoric and sulphuric acids. Must be single, American born and with American born parents. State experience and salary required. Good chance for advancement. Send recent photo.
Box 59-TP-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST

Excellent opportunity for recent graduate with doctor's degree. Several years with industrial company important but not necessary. In reply state experience and enclose photo.

Box 75-TP-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Assistant chemical engineer. Both men must have plant experience in the manufacture of ethyl alcohol, preferably from grain materials. Submit complete information on training, experience, personal data, draft status and include photo.
Box 89-T-4, Ind. & Eng. Chem., Easton, Pa.

PROCESS ENGINEER. Company manufacturing processing machinery wants engineer of sufficient experience to take over the designing of Mixers, Kettles, Autoclaves, Attrition machinery and other process equipment. Location—Southern Ohio, and all organization executives are familiar with this ad. Excellent position for the future for proper experienced man.
Box 110-TP-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, single, sugar experience preferred; development work; South America; give full details regarding education, experience, salary; send small photo.
Box 95-TP-4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, Biochemist, Cereal Chemist, Chemical Engineer, Food Technologist, Organic Chemist, Physical Chemist. Consideration will be given to applications from Bachelors, Masters, Ph.D.'s and those with a few years' post-doctorate experience. These openings represent opportunities for qualified persons in the Research Laboratories of a prominent food organization located in the East. Applicants should submit educational history, college record, experience, age, and other personal data, and recent photograph.
Box 100-TP-4, Ind. & Eng. Chem., Easton, Pa.

OUTSTANDING PHARMACEUTICAL manufacturer seeks director for development and research foundation, thoroughly trained organic chemist, with working knowledge bacteriology and biology. East. $5,000-$10,000. *Superintendent*, wholesale drug experience, foreign and domestic, shipping, receiving, handle engineering problems small milling plant. East. $5,000-$7,000. *Physicians*, Eastern ethical pharmaceutical manufacturers in medical promotion department. $3,000-$6,000. Medical Director, small ethical house. Salary open. *Physician*, editorial writer eminent medical publication. To $6,000. *Organic* chemists, midwest, $3,000-$4,000. *Control* chemists, New England, $2,000-$3,500. *Men & Women* pharmacy bachelors, some experience, $150-$250. *Pharmaceutical* chemists. East. $250-$500. *Tablet* & ointment manufacturers (2) to $300. East. *General* pharmaceutical research, three to ten years out of college. Open. *Women* chemists, several pharmaceutical and analytical openings. East. $125-$250. Replies will be considered confidential. No registration fee. Everett Brown Agency, 17 John Street, New York.

ORGANIC CHEMIST, familiar with either research or production on either or all of the following chemicals: Phenol, formaldehyde, pentaerythoritol, hexamethylene tetramine, alkylated phenols and phthalate esters. Give full particulars in first letters. Location Middle West.
Box 106-TP-4, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, bachelor or master degree with thorough training and experience in microchemistry analyses (Pregl methods). Only those who have at least two years of experience in this special field need send applications, including recent picture to: Carl Tiedcke, 366 Fifth Ave., N. Y. C.

CHEMIST: wanted for work in chemical laboratory of large Oklahoma refinery. Give complete details, including education, citizenship, experience, salary desired. Send photograph.
Box 108-T-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC or BIOLOGICAL chemist to fill teaching position in A.C.S. approved college. Ph.D., not over 35 years of age, with teaching experience in small college preferred. Teaching not excessive. Opportunity for research. Rank and salary dependent on qualifications.
Box 109-T-4, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL MEN WANTED

Metallurgists, hydrometallurgists, and chemical engineers with milling experience, mechanical engineers, and welding engineers. For research on problems relating to war industries.

BATTELLE MEMORIAL INSTITUTE
COLUMBUS, OHIO

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

PHYSICAL CHEMIST. Chemical Engineer. Eight years' teaching chemistry and chemical engineering. Six years' varied industrial experience in responsible positions. A.I.Ch.E. Desire teaching position — chemistry.
Box 19-N-3, Ind. & Eng. Chem., Easton, Pa.

PRIVATE RESEARCH assistant in large Eastern university. Organic chemist, Ph.D. 1941. Undergraduate major — Bio-chemistry. Research on amines, amino acids, unsaturation, organic synthesis. Publications. Graduate assistant in organic 4 yrs. Desire research or teaching position. Draft deferred, 27, single, available immediately.
Box 54-N-3, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED REFINER of corn starch, corn syrup and by-products, seeks position as director of research, chief chemist, assistant shift superintendent or general superintendent.
Box 60-N-3, Ind. & Eng. Chem., Easton, Pa.

ENGINEER with exceptional training and ability. Degrees in chemical and industrial engineering leading universities. Successful record in research and development on plastics, cellulose paper, lignin, extraction and engineering economics; would prefer production. Fluent French, Spanish. Single, 24, draft deferred, immediately available.
Box 11-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and CHEMICAL Engineer, B.S. 1941. Now working toward M.Ch.E. Extensive laboratory training in analytical organic and inorganic. Single, 23, draft deferred. Desires analytical, production, control and research work. New York preferred; will consider anywhere. Available June 1st.
Box 29-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.SC. in Chemistry, May 1942, prefers employment within 100 miles of Philadelphia, but will go anywhere. Scholarship student (I Q. 150), with summer experience in control laboratory Basically trained in inorganic, organic, analytical and physical chemistry, also in microanalysis.
Box 38-T-3, Ind. & Eng Chem., Easton, Pa.

ANALYTICAL CHEMIST, B.Sc. May, 1942. Standard training in main divisions of chemistry, including microanalysis and chemistry of foods and drugs. Scholarship student, college laboratory assistant, summer experience in petroleum industry.
Box 40-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Thirteen years' experience in research, development, and production on nitrogen, chlorine, and sulfur compounds, poisonous and volatile gases, and high pressure catalytic synthesis. Expert in training personnel and starting new plants.
Box 54-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, research, development, M.A. eastern university 1942. Teaching fellow, B.A. far western university 1938. Two years' experience in mid-west in synthetic resins, coatings, plastics, and related products. Persistent worker. Age 25. Selective service 2-A. Available June.
Box 58-T-3, Ind. & Eng. Chem., Easton, Pa.

THOROUGHLY TRAINED chemist. M.S. Iowa State; B.S., Ph.D. Cornell. Research: plant pigments, vitamins, bioassays, balance studies, feed and food analyses, mineral nutrition. Experience; two years' industrial, one year head of chemistry department small college. Phi Kappa Phi. 26, married. Desires teaching with opportunity for research.
Box 66-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Ph.D. Wide experience in theoretical and synthetic organic chemistry. Undergraduate and graduate study, academic and industrial Post-doctorate appointments, and instructorship, at large Eastern University. Phi Beta Kappa, Sigma Xi. Publications, independent research. Employed. Desires industrial or academic position.
Box 76-T-3, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D.; Sigma Xi; wishes part-time literature or laboratory work in New York City area; now employed; own laboratory; synthesis and analysis; prefers small active firm.
Box 82-T-3, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST CHEMIST: desires teaching or industrial connection. Five years' metallurgical and chemical college teaching experience; worked four years steel mills. Experience includes physical testing, analysis, melting, inspection. Age 34, married. now employed.
Box 10-N-4, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist. M.S. leading University. Young, personable, responsible. Excellent organic training. Research and industrial experience. Desires organic research position in a metropolitan area, preferably New York or Chicago. Presently employed.
Box 14-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH chemist. Ph.D. 1937. Age 29. Employed, married. 5 years' industrial experience in synthetic, analytical, developmental aliphatic and aromatic chemistry. Good technician. Keen student of scientific literature. Vital defense development position sought. Salary $4500.
Box 16-N-4, Ind. & Eng. Chem., Easton, Pa.

ATTENTION — COLLEGES and Universities. Do you need chemistry instructors for your summer session? Here's one with five years' experience at a Grade A college. Ph.D. honor societies. Married. Available May 25 to Sept. 15.
Box 24-N-4, Ind. & Eng. Chem., Easton, Pa.

SUPERINTENDENT or FACTORY Manager. Accustomed full responsibility. B.S., M.S., Ch.E. Plant design, pilot, layout, development, installation; operation, maintenance, production planning, costs, chemical economics, mass production, packaging, personnel and sales relations. Solvent recovery, distillation (including vacuum), oleum handling. Inorganic and synthetic chemicals, alcohols, alkaloids, plastics, solvents. Age forty, married, American ancestry, Protestant; consulting experience, patents, publications, references. Available immediately, war production preferred.
Box 30-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, M.S. in Physical Chemistry. Two years' graduate work toward Ph.D. with research in Ceramics and high temperature physical chemistry. Experience in physico-chemical measurements, refractories, electrode-potentials, use of petrographic microscope, X-ray, spectroscope. Excellent record, references. Favorable draft status.
Box 35-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST-Chemical Engineer, Ph.D. Organic and Chemical Engineering, August 1942; B.S. 1939; M.A. in organic and analytical, 1940; Ph.D. course work complete in May. Research on Phenanthridine in progress. Excellent background in thermodynamics, theory of plastics, and organic synthesis. Possesses initiative, ambition, and ability to work with people. Want responsible position in industrial development or university teaching. Unmarried, good health, honor societies. Draft classification 2-A. Age 23. Available September 1942.
Box 47-N-4, Ind. & Eng. Chem., Easton, Pa.

SUMMER TEACHING position desired by assistant professor at accredited eastern college. Ph.D. 34 years' old. Will teach general, analytical or physical chemistry. Eastern location. Will consider permanent position with opportunity for advancement.
Box 58-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., with good background in organic and physical chemistry. Teaching and industrial experience. Three years' research in vitamins with publications. Now employed. Age 29, married. Research or teaching position desired in East. Available on short notice.
Box 65-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Available June 1. Graduate research with organometallics at leading midwest university. 3 years' teaching experience, desires to go into organic research in industry. Some experience with dyes, organic syntheses. Single, 23, Protestant, draft 2-A. Location immaterial. Now located in Iowa.
Box 66-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1942 (June). Vitamins and nutrition. Good foundation in organic and physical chemistry and physiology. Research on vitamin B complex and protein requirements. Publications. Five years' teaching biochemistry, general and physical chemistry. Desires research or teaching.
Box 69-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, AGRICULTURAL, M.S. Age 32, Major—soil, plant and analytical chemistry. Seven years' experience. Also interested in fertiliser work. Location immaterial. Now employed. Protestant. Draft 3A. Available 30 days.
Box 70-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC PH.D. Nine years' experience in research and development of synthetic medicinals, pharmaceutical specialties, food products and processes, control methods. Capable analyst, working knowledge of bacteriology, physiological chemistry, and pertinent medical sciences. Experience in arranging clinical trials of new medicinals. Understands commercial aspects of research work. Thorough knowledge of Food and Drug Laws. Administrative ability. Laboratory facilities available if desired. Publications. Employed. Married.
Box 72-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, Bacteriologist. A.B., 16 years' experience in foods, biological and bacteriological products, plant management including production, maintenance, personnel, and accounting. Successful research and sales records. Patent experience. Age 39, married, Protestant. Continental U. S. preferred.
Box 83-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH or DEVELOPMENT position desired, preferably on the Pacific Coast or in Rocky Mountain States. Ph.D. in Physical and Inorganic Chemistry, University of Minnesota, 1930. Industrious worker. Eigh tyears' experience in inorganic research; five years' teaching experience. Age 40.
Box 11-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S. 1936. Draft classification 3-A. Six years' experience in research department of large manufacturer of fiber board structural insulation. Well versed in the manufacture of and finishing treatment of such products as asphalted blocks and sheathing, acoustical materials, and decorative panels.
Box 15-T-4, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR of RESEARCH Ch.E., Ph.D. Twenty years' experience. Food, feeds, vitamins, nutrition, pharmaceuticals, biologicals. Man of wide experience with high attainments and outstanding accomplishments desires position with company undertaking expansion in research or setting up new department.
Box 16-T-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT Chemist. B.S. in Chem. Fourteen years' diversified experience on plastics, synthetic resins, organic chemicals, paints, varnishes, cloth and paper coatings and process development. Excellent record and experience. East preferred. Available immediately. Draft deferred.
Box 18-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, working for masters in physical chemistry, desires position with progressive firm which would give opportunity for someone without actual experience, to prove their ability for research or otherwise. Graduate assistant in large eastern university. Also qualified in inorganic, analytical and organic.
Box 20-T-4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.S., 3-A draft classification. A dozen years of wide and varied experience. Desires responsible position in research laboratory of large corporation in the New York City area.
Box 21-T-4, Ind. & Eng. Chem., Easton, Pa.

TEACHER RESEARCH worker; Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, etc. Sixteen years' industrial research, consulting, testing. Numerous publications. Employed. Seeking broader field.
Box 22-T-4, Ind. & Eng. Chem., Easton, Pa.

YOUNG PLANT executive, chemist, M.S. degree, manager of inorganic chemical company, desires permanent position with greater opportunity for advancement. Wide experience; research, production, improving plant processing, reducing operating costs, technical sales and personnel supervision. Starting salary $6000–$7000.
Box 23-T-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Broadly trained, excellent scholastic record, additional graduate study, over two years' experience in research and plant development. Married, American, wants production work in defense industry; southeastern location.
Box 24-T-4, Ind. & Eng. Chem., Easton, Pa.

CELLULOSE CHEMIST: Chief chemist of small eastern non-defense plant desires work in defense industry. Age 28, married, six years' diversified experience in pulp and paper research, production, conversion, sales, and industrial applications.
Box 25-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Age 29, draft 3A. Eight years' varied experience in sales, chemical research, development, manufacturing and plant design. Expert in petroleum chemistry and engine mechanics. Thoroughly conversant with technical sales, advertising, and general marketing problems. Desires connection with chemical or oil concern that can utilise the combined assets of a competent chemical engineer, and a sales minded business promoter. Prefer to oeate in or near N. Y. C.
Box 26-T-4, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMIST Executive Ph.D. 15 years' experience and successful record in managing Prod. Dept. of large plant. Thoroughly familiar with modern methods of plant operation, production planning, cost calculations, etc. Primarily interested in industrial production supervision and process development. Age 44.
Box 27-T-4, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL ORGANIC Chemist, Ph.D. June, 1942. Thesis on pressor amines. Graduate training in organic synthesis, chemistry of medicinal products, physical chemistry, analysis, pharmacology, catalytic reductions. Draft 2-A. Sigma Xi, Rho Chi. Five years' teaching assistant.
Box 32-T-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942. Available immediately. Research experience in organic synthesis and enzyme chemistry. Interested synthetic organic or biochemical research. Age 24, single, draft deferred. East preferred. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi.
Box 34-T-4, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 575)

(Situations Wanted Continued)

ORGANIC CHEMIST, Ph.D. 1939. Desires research position in the middle-west, in the field of synthetic organic chemistry. Sigma Xi, Phi Lambda Upsilon. Industrial experience. Employed, available within reasonable time. Draft deferred. Married.
Box 36–T–4, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT or ASSOCIATE professorship of organic chemistry in well established institution, beginning in September. Ph.D. prominent University, 1931. Eight years' department head in small mid-western University. Excellent record building up Department. Experience teaching undergraduate and graduate courses, directing M.S. researches, administration, placement, purchasing, glass blowing. Recent and projected publications based on M.S. theses. Sigma Xi, Phi Lambda Upsilon. Active A.C.S. section. Superior references. Protestant, age 37, married. Location immaterial.
Box 37–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. 1941. Midwest university, single, 24, American born, draft deferred. Employed since graduation. Supervisory capacity in heat treating of alloy steels. Desires change but will consider similar position. Interested in synthetic organic field.
Box 38–T–4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A., M.S., Ph.D. with California teaching credential wishes employment as teacher or in research near Los Angeles, Calif. Six years' research in X-ray crystallography, two publications, two years' teaching experience in Jr. college. Age 29.
Box 39–T–4, Ind. & Eng. Chem., Easton, Pa.

METALLURGICAL CHEMIST, M.S., June 1942. Inorganic major and physical metallurgy minor. Undergraduate research in organic; graduate research in inorganic. Summer experience in analytical chemistry. Experience with metallographic photomicroscope and X-ray diffraction equipment. Defense course in metal's inspection. Desires Southern California position.
Box 40–T–4, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, A.B. 1941 from Mount Holyoke College, with one year's work as graduate assistant toward Masters Degree, desires position with chemical research laboratory in New York City or vicinity. Protestant. Iota Sigma Pi. Fluently German; reads French.
Box 41–T–4, Ind. & Eng. Chem., Easton, Pa.

AGRICULTURAL CHEMIST, M.S., experienced in agricultural research and analyses. Major fields biochemistry and organic. Some experience in food industry. Desire research or plant operation in a defense industry. Age 26. Married.
Box 43–T–4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. B.S. in Ch.E. 1935, age 29, married. Six years' experience in organic synthetics. Product and process development from laboratory to plant production. Desires location near New York or New Jersey.
Box 45–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S., 25 years' diversified analytical and development experience. Employed. Last 12 years charge analytical laboratory prominent plastic manufacturer. Will consider position requiring broad experience and mature judgment. Location immaterial. Age 47, married, American.
Box 47–T–4, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION, College, University or Technical Institute. Ph.D. from leading technical institute, experienced teacher. Research, many publications and patents covering 12 years industrial experience. Sigma Xi, Tau Beta Pi, Phi Lambda Upsilon, Pi Mu Epsilon. Age 35, married.
Box 48–T–4, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE with broad scientific training and administrative experience desires new connection with progressive and responsible organization. Ability proven through successful planning and directing technical projects. Market development a specialty. Familiar with heavy chemical manufacturing operations. Patents. Publications. Ph.D. Protestant. Married. Age 42.
Box 52–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1941. A.C.S. accredited university. Major biochemistry and organic. Desires position with industry engaged in defense work—research preferred. Presently employed as instructor in same university. Single, 24, assurance of draft deferment. Sigma Xi. Available June 1. Location immaterial.
Box 54–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry in liberal arts college, June 1942. Age 21. Training includes physical chemistry and organic analysis. Location immaterial. Available in June.
Box 55–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST M.S. Accredited eastern university. Fellowship. Organic major, but thoroughly trained in physical, inorganic, analysis. Desires research or production position, preferably in east. Available middle of May, 1942. Single.
Box 56–T–4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST wants real job. Ph.D. 1933. Over six years' industrial organic research (synthesis), development, supervision, technical service in antiseptic, insecticide fields. Two patents pending. Two years' teaching experience. American, age 36, married, children, Protestant, 3-A. Go anywhere. Now employed in New York area.
Box 58–T–4, Ind. & Eng. Chem., Easton, Pa.

SUMMER POSITION, May 18, Sept. 1, desired by chemistry instructor. Ph.D. Can install analytical laboratory. Specialties-engineering, colloidal and physical chemistry, instruments. Eastern location.
Box 61–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., M.S. with additional work toward Ph.D. Three years' experience Viscose Rayon. Graduate work on Slash Pine. Prefer work with cellulose industry. Age 37, married, draft classification 3A. Protestant.
Box 63–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST. B.S. in Ch.Eng., 1940. Single, 27, previous classification 2-B. One year's experience naval stores plant and laboratory control. Desire analytical, control, or research work. Available immediately.
Box 67–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST. Technical degrees. Three years supervision and research in resins, paints; 1/2 year same in by-products from dry distillation of coal. Desires research work, but would also work analytically. Will go anywhere, preferably Middle West.
Box 68–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. 1934. Thoroughly trained in analytical, organic and physical chemistry. Diversified experience for past seven years. Now completing Defense course in physico-chemical measurements; qualified for position in testing, control and research work. Desires position defense industry. Married. 3A draft.
Box 69–T–4, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, B.S., Special training in rubber chemistry. Experienced in synthetic rubber research. Desires responsible research position. Age 23. Draft deferred.
Box 72–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: B.S. in Ch., Ch.E. Industrious worker with well above average ability and intelligence. Three years experience in research and process development. Desires similar position or position giving technical service or assistance to production department. Single. Job with 2B draft classification soon coming to a close.
Box 73–T–4, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN Chemist having several years experience in actual formulation and manufacture of thermosetting resins, which include urea, melamine, phenol and aniline types for molding, laminating and adhesive applications. Also, experience in compounding, blending, and molding of thermosetting compounds. Desire responsible position in plastics development.
Box 76–T–4, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.S. in Chem., June 1942. Experience in teaching, spectroscopy, reaction kinetics, drying oils. Wants position in which his talents can be of use in war effort, especially in plastics or synthetic rubber. Eastern seaboard preferred, but location immaterial.
Box 77–T–4, Ind. & Eng. Chem., Easton, Pa.

ATTENTION: SUCCESSFUL organic research chemist (Ph.D.) with ten years experience in varied fields desires executive or administrative position with progressive organization. Familiar with manufacturing methods for phenol and other resin raw materials.
Box 78–T–4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, M.S., 15 years experience in analytical methods of testing, production and development. Resourceful adaptable, and creative. Author of books. Capable of directing laboratory, production, and research. Age 40, American, married, and employed.
Box 79–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. desires responsible position with financially sound and progressive company. 25 years experience in production, control, development, vacuum processing milk and food products. Knowledge of vitamin fortification and food laws.
Box 81–T–4, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST, B.A. One and a half years post graduate work. Seven years' experience in analyses and inspection of foods and feed stuffs. Minneapolis area desired. Draft status 3A.
Box 90–T–4, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PROFESSOR of organic and analytical desires position in essential industry or teaching position in a department interested in developing chemists. Ph.D., M.S. in organic physical minor, recent research in nonferrous electrochemistry. Sigma Xi, Phi Lambda Upsilon, publications. Protestant, married, age 29. Philadelphia area preferred, but will go anywhere, including South America.
Box 91–T–4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. B.S. 1940 with one year's analytical experience in pharmaceutical house. Available in May. Single, 22, 2-B. Eastern location preferable. Desires employment in control or production.
Box 93–T–4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH PHARMACEUTICAL organic chemist, Ph.D., 1941, large mid-western university. Research experience in organic syntheses, sulfur and nitrogen compounds, vitamins. Publication. Member Sigma Xi, Phi Lambda Upsilon, Rho Chi, age 27, married, draft 2-A Now employed, but desires new connection where his abilities can be utilised fully. Available upon short notice.
Box 96–T–4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST M.Sc. 1940 with 1 1/2 years of industrial experience desires employment in any of the Defense Industries, in control or in production. Also desires position as an Assistant Spectrographer. Eastern location preferable.
Box 97–T–4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, 1940 Ph.D., married, now teaching in a N. Y. college, seeks position in synthetic organic research. Industrial and institute experience, Sigma Xi. Particularly interested in work contributing to the war effort. N. Y. C. area preferred; position for the duration acceptable.
Box 99–T–4, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST wants position as analytical chemist in some industry. B.A. degree in June, 1942, 45 semester hours in chemistry, including inorganic, organic, analytical, and physical chemistry. Location near Newark, N. J. or New York City. Available June 15th.
Box 101–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER· Experience maintenance, production, and design. Degree B.Ch.E. Able to work in non-defense industries.
Box 103–T–4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Desires research position. Experience: Phenols, sterols, aminoacids, vitamins, synthesis, organic analysis, micro-analysis. Familiar with electrospectrophotomery, pH control, micro-biological techniques. Languages: German, French, Publications. Draft: 3-A (dependency).
Box 104–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., with three years' industrial experience in chemical, metallurgical, petroleum, and fuel technology; also one year in other technical fields. Currently employed as subchief chemical engineer responsible or development, design, erection, and operation of synthetic fine chemicals plant. Will consider only war program activities; location, hazards, permanence of work immaterial. Salary no object, but seeking position demanding utmost in resourcefulness, driving energy, and breadth of technical training. Present employer knows of intentions. Draft 2A. Single.
Box 117–T–4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. Broad knowledge of all branches related to biological chemistry. For many years directing biochemical and biological research in the field of hormones, enzymes and vitamins. Special experience in protein chemistry. Numerous publications, member of several scientific societies. At present employed. Desires responsible position in research laboratory.
Box 118–T–4, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER, degree. Four years' food technology and development, mostly prepared cereals. Now production manager for food company with large national business. Two years' research and control of electrotyping solutions. Receptive to offers from other fields. Married, 3 children, age 27.
Box 12–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 1941. Experienced in research and development. Desires development work or position giving technical service or assistance to production department. South or Southwest location preferred. Age 24, married. Company must be eligible to request continuance of 2B draft classification or equivalent.
Box 33–T–4, Ind. & Eng. Chem., Easton, Pa.

PLANT SUPERINTENDENT, experienced in design, erection, operation and technical direction of vegetable oil plant manufacturing refined and hydrogenated oils, Oleomargine, Mayonnaise, Distilled Fatty Acids and Crude Glycerine.
Box 44–T–4, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 576)

(Situations Wanted Continued)

LIBRARIAN for industrial or commercial research department. Young woman. Phi Beta Kappa. University graduate; library school trained. Science major, including chemistry, bacteriology, biology. Literary ability. Knows German, French, Spanish, typing. Location immaterial.
Box 50–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D. Eight years' experience research, process design, and technical service major petroleum refinery.
Box 51–T–4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, age 45. Thoroughly experienced, practical analysis of metals, ores, silicates, gas, water, chemicals, commercial organic materials. Now employed near Philadelphia. Seeks new connection offering permanency of employment at moderate pay.
Box 57–T–4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, 26, married, deferred 3A; M.S. 1937 University Illinois. Now developing methods for converting nicotine and coal tar bases to nicotinic acid. Patents. Previous experience organic synthesis and research some analytical.
Box 62–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER in fractional distillation, B.S., 30, married, six years' experience in operation, design, research and development in benzol industry; especially experienced in toluol purification. Desire work in petroleum, coal-tar or industry connected with their design and construction.
Box 65–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. B. of Ch.E. 1940. Experienced in chemical economics; preparing critical law material consumption surveys for priority reports, production planning, standard cost analysis, power conservation. Presently employed by large out-of-town dyestuff manufacturer. Desires similar position N. Y. C. or vicinity. Age 25, draft 3A.
Box 70–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST ORGANIC, six years production and development work on solvents, varnishes and synthetic chemicals. B.S. degree. Graduate work, defense courses. Age 27, married, citizen.
Box 74–T–4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., June 1942, desires research position. Thorough basic training in all branches of chemistry and in bacteriology. Research in heterocyclics, sulfanilamides, and natural products. Linguistic ability. Member of Organic Division. Age, 23, unmarried. Protestant.
Box 80–T–4, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, organic major M.S. 1940, two years' experience as graduate assistant in general and organic chemistry. Two years' experience as production chemist. Available within reasonable notice.
Box 88–T–4, Ind. & Eng. Chem., Easton,

WOMAN CHEMIST B.A. in May 1942 from A.C.S. accredited university. Honor graduate with 44 semester hours in Chemistry. Eastern location preferable.
Box 98–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in 1942. Good background in biochemistry, bacteriology, food analysis, organic, inorganic, physical and analytical chemistry. Desires position with industrial or pharmaceutical firm. Location immaterial. Unclassified for selective service. Available in May. Excellent references.
Box 105–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, eight years' experience in research, development, specification, applications of vinyl type resins and coatings. Interested in plastics and synthetic rubber. B.Ch.E., M.Sc., age 31, married, class 3-A, Protestant, employed non-defense.
Box 119–T–4, Ind. & Eng. Chem., Easton, Pa.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

INDEX MEDIA for Chemical Microscopists and Petrographers. Supplied to leading institutions throughout the world for many years. Research Set. Nd 1.41-1.78, steps .01, in applicator bottles with leatherette case $31.50. Everything practicable in liquid and solid media. J. T. Rooney, Box 358, Buffalo, N. Y.

TRANSLATIONS FROM almost any language. A. A. Boehtlingk and Staff, 2022 Cedar Street, Berkeley, California. Specialty Synthetic Rubber (Russian) and Petroleum.

HUBBARD LABORATORIES complete spectrophotometric vitamin assay service. Spectrographic analyses for trace metals in alloys, food and pharmaceutical products, corrosion deposits, catalysts, electrolytic coatings, ores, and chemicals of all kinds. Price schedule forwarded upon request. 125 West Hubbard Street, Chicago, Illinois.

FOR SALE: Bausch and Lomb, Harvey, centrifuge-microscope. In excellent condition.
Box 13–T–4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: 100 grams of nicotinamide, 100 grams 8-hydroxyquinoline, 100 grams hexylresorcinol, 200 grams coumarin, 200 grams nicotinic acid, and 100 grams diphenylamine. Offers solicited.
Box 14–T–4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Cenco spectrograph, 18 months old, perfect condition, grating of exceptional quality, complete auxiliary equipment including power control unit.
Box 17–T–4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: 1000 pounds Beryllium Copper Scrap, 2½% Beryllium, 100 pounds Portuguese Wolframit, large lumps, 2 tons each Strontium, Carbonate, Nitrate, 5 tons Cerium Chloride Tech, 100 tons Black Oxide Iron Magnetic, Ton Antimony Metal Powder, Ton Ground Beryl.
Box 60–T–4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical Abstracts Vol. 6 to 35 inclusive; first and second decennial index; J.A.C.S. Vol. 45 to 63; Ind. Eng. Chem. Vol. 12 to 33; Anal. Ed. Vol. 1 to 13; News Ed. Vol. 10 to 19; J. Chem. Educ. Vol. 1 to 18; School Science Review numbers 67 to 76. All unbound in good condition. Location Washington, D. C. Any reasonable offer for all or part will be accepted.
Box 64–T–4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: "Journal de Pharmacie et de Chimie": 1816–1834, 1854–1870, 1873, 1884–1908, bound; "Bulletin, Societe Chimique de France": 1889–1902, 1907–1911, 1914, 1917–1918, 1925–1935. W. Westerfield, 7 Hobart Street, Bronxville, N. Y.

FOR SALE, immediate delivery, Spencer Binocular Microscope, (2) Monocular Microscopes with 3 objectives, Schmidt & Haensch Polarimeter, Gaertner Cathetometer, Gaertner, Spectrophotometer Unit, Micrometer Measuring Microscope, (2) Rotary Microtomes, Leeds & Northrup Potentiometers-Eppley Standard Cells, L. & N. Galvanometer, (2) Bausch & Lomb Dubosq Colorimeters, (5) Compound 2 Objective Microscopes, (8) Torsion Scales all types, Analytical Balances, Pulp Balances, Specific Gravity Balance, etc. Write for full list or send us your wants, The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE, In stock for immediate delivery, (2) Organic Combustion Furnaces three section type, (3) Freas 12 × 12 Double Wall Drying Ovens, Freas Carius Oven, Freas Vacuum Oven, Thelco Large Incubators, (3) International Centrifuges size SB and size 2 with all Accessories, (3) Horizontal Sterilising Autoclaves Double wall Dial lock door various sizes, Hanovia Ultra Violet Quartz Lamps, Watson Stillman 12 × 12 Hydraulic Press, DeLaval Purifier, De-Laval Disk Clarifier, (3) Barnstead Water Stills for gas or Electric Vacuum Pumps, Mercury Barometers Pellin Types, etc., write us your needs for immediate quotation, The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE, Laboratory Hydraulic Presses, New 6 × 6 Labtest Press Self Contained, 10 Ton capacity, complete with Gauge, adjustable opening between Platens, available for immediate delivery with or without Electric Hot plates, write for full details, The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE, Drying ovens, new single wall drying ovens 12 × 12 × 10 with Thermostatic control, cast construction, heavy asbestos wall insulation, available for immediate delivery. Write for bulletins, The Laboratory Exchange, 24 E. 21st St., N. Y. C. Algonquin 4-3879.

FOR SALE, Balances, Pulp in Fine Mahogany Glass Case with sliding door, Drawer, capacity 160 gr. sensitivity 1 mg., a very fine general laboratory balance in new unused condition, available for immediate delivery reduced to $27.50 while they last, order without delay, The Laboratory Exchange 24 E. 21st St., N. Y. C.

FOR SALE: Active commercial and metallurgical laboratory, splendidly equipped and in full operation. Valuable active accounts and large field for expansion into routine analytical work. Opportunity for good producer to acquire old established business
Box 113–T–4, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: A complete set of the first series of the Zeitschrift füer physikalische Chemie, volumes 1–107, inclusive, with indices. The volumes are bound in cloth, except the first sixteen volumes which are in half-leather. For information apply to
Box 114–T–4, Ind. & Eng. Chem., Easton, Pa.

WANTED: New or used hand or power mill with six to eight inch diameter horizontal stone or acid-proof porcelain grooved grinding surfaces, similar to A. H. Thomas Company catalog No. 4264. Quote price in reply to Northern Regional Research Laboratory, 825 North University Street, Peoria, Illinois.

WANTED: Rubber mill, 10" × 24" rolls or thereabouts, in A-1 condition; also miniature mill, approximately 2" × 6" rolls.
Box 31–T–4, Ind. & Eng. Chem., Easton, Pa.

WANTED: substantial quantities Histamine Diphosphate, Histidine Monohydrochloride, Rhamnose, Calcium Levulinate, Asparagin, Sodium Glutamate. Advise price and quantities available for immediate or definite future delivery.
Box 35–T–4, Ind. & Eng. Chem., Easton, Pa.

WANTED: LABORATORY apparatus and equipment urgently. We wish to purchase all standard laboratory instruments such as Abbe Refractometers, Polarimeters, Microscopes, Spectroscopes, cameras, binoculars, accessories, lenses, measuring microscopes, micrometers, objectives, evepieces, mechanical stages, balances, Spectrographs, etc., complete laboratories, or single items. Offer us your surplus equipment now, write or wire or phone us for immediate attention, The Laboratory Exchange 24 E. 21st St., N. Y. C.

WANTED for PRIVATE library only important chemical books and journals, American and Foreign. State condition, author, title, publisher, year of publication. Would also purchase complete private or corporation libraries. Dr. G. H. Fransius, 201 East 82nd Street, New York, N. Y.

WANTED: small quantities of diamino acetone and di iso nitroso acetone.
Box 115–T–4, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL AND ENGINEERING NEWS

HARRISON E. HOWE, Editor

PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY

VOLUME 20 MAY 10, 1942 NUMBER 9

A. C. S. Memphis Meeting

Directors' Minutes

THE Board of Directors of the AMERICAN CHEMICAL SOCIETY met in Room 213 of the Peabody Hotel, Memphis, Tenn., at 8:20 P. M., April 19, 1942. Thomas Midgley, Jr., Chairman of the Board, presided, and the following Directors were present: L. H. Adams, Roger Adams, Robert T. Baldwin, E. K. Bolton, Willard H. Dow, William Lloyd Evans, Per K. Frolich, Harry N. Holmes, Charles L. Parsons, R. E. Swain, and Charles A. Thomas. Alden H. Emery was present by invitation.

It was moved, seconded, and carried that the minutes of the previous meeting be approved.

Thomas Midgley, Jr., was unanimously re-elected Chairman of the Board of Directors, and he, together with the President, the President-Elect, the immediate Past President, the Secretary, and the Treasurer, were elected as an Executive Committee.

The Secretary presented an ad interim report on the condition of the SOCIETY, and the Board recommended that this be presented to the Council at its meeting the following day (see Council Minutes, page 579).

A report of the Finance Committee was received, accepted, and ordered placed on file.

It was moved, seconded, and carried that because of mounting costs of labor and material an increase in compensation of 5 per cent be made to the Mack Printing Co., Easton, Penna., as outlined in a letter from the company dated February 19, 1942, the new rate to be retroactive to April 1, 1942, and to be incorporated in the contract now existing between the Mack Printing Co. and the AMERICAN CHEMICAL SOCIETY.

It was moved, seconded, and carried that the AMERICAN CHEMICAL SOCIETY Chapter of Student Affiliates at the Alabama Polytechnic Institute be dropped from the roles because of failure to comply with regulations approved by the Board of Directors on September 6, 1937. For some time the chapter's membership has been below the minimum number required under the rules.

It was moved, seconded, and carried that the ad interim report of the Committee on Economic Status be placed on file.

It was moved, seconded, and carried that an additional appropriation of $2,000 be added to the 1942 budget for expenses of the Committee on Economic Status.

It was moved, seconded, and carried that the report of progress of the Committee on Chemical Service to Medicine be accepted and placed on file.

At 12:03 A. M., April 20, just prior to adjournment, it was moved, seconded, and carried that all motions above recorded be approved. There being no further business, the meeting adjourned.

CHARLES L. PARSONS, *Secretary*

A. C. S. Meeting Registrations

YEAR	PLACE AND DATE	REGISTRATION
1935	New York, N. Y., April	5105
1935	San Francisco, Calif., August	1111
1936	Kansas City, Mo., April	1491
1936	Pittsburgh, Penna., September	2904
1937	Chapel Hill, N. C., April	2155
1937	Rochester, N. Y., September	3483
1938	Dallas, Tex., April	1093
1938	Milwaukee, Wis., September	2871
1939	Baltimore, Md., April	4024
1939	Boston, Mass., September	3924

1941	St. Louis, Mo., April	3960
1941	Atlantic City, N. J., September	5021
1942	Memphis, Tenn., April	2324

Council Policy Committee Minutes

THE Council Policy Committee met at 3:30 P. M. in Room 1101 of the Peabody Hotel, Memphis, Tenn., April 19, 1942, with President Harry N. Holmes in the chair and Messrs. Robert T. Baldwin, Erle M. Billings, E. J. Crane, G. J. Esselen, Wm. Lloyd Evans, Per K. Frolich, Arthur B. Lamb, Thomas Midgley, Jr., Charles L. Parsons, and Walter A. Schmidt present.

The committee requested the President to appoint Per K. Frolich and Paul D. Bartlett as representatives of the AMERICAN CHEMICAL SOCIETY on the Division of Chemistry and Chemical Technology of the National Research Council for the period July 1, 1942, to June 30, 1945.

After careful consideration of possible loci for AMERICAN CHEMICAL SOCIETY meetings in 1945, the committee recommended to the Council that any decision in regard thereto be delayed until a later date.

A successor to Wm. A. Noyes, deceased, Editor of Scientific Monographs, was considered. A communication received from the members of the Board of Scientific Monographs showed that all members of the board were of the unanimous opinion that the work should be carried on by Harrison E. Howe. Recommendation was made to the Council that Dr. Howe be elected and that he be recorded as "Editor of Monographs".

The meeting then adjourned.

CHARLES L. PARSONS, *Secretary*

Future A. C. S. Meetings

September 7 to 11, 1942	Buffalo, N. Y.
Spring of 1943	Indianapolis, Ind.
Fall of 1943	Minneapolis, Minn.

The Council Meeting

THE Council of the AMERICAN CHEMICAL SOCIETY met in the Ballroom, Peabody Hotel, Memphis, Tenn., at 9:40 A. M., April 20, 1942, with President Holmes presiding and the following Councilors present:

Councilors and Substitutes

Ex Officio. L. H. Adams, Roger Adams, Robert T. Baldwin, Edward Bartow, L. W. Bass, Shailer L. Bass, Erle M. Billings, E. K. Bolton, F. E. Brown, S. M. Cantor, E. J. Crane, Willard H. Dow, Wm. Lloyd Evans, W. Conrad Fernelius, Per K. Frolich, John H. Gardner, Harrison Hale, E. H. Harvey, Harry N. Holmes, C. S. Howard, Arthur B. Lamb, S. C. Lind, Thomas Midgley, Jr., Ben H. Nicolet, Charles L. Parsons, Orin W. Reese, Jos. K. Roberts, G. L. Royer, Walter A. Schmidt, Lee I. Smith, Robert E. Swain, Charles A. Thomas.

Councilors-at-Large. Wm. Mansfield Clark, Gustav Egloff, Henry Gilman, Edward Mack, Jr., Carl S. Marvel, W. A. Noyes, Jr.

Local Sections. *Akron*, A. J. Gracia (subs.), E. E. Gruber (subs.), E. G. Haas. *Alabama*, Ellis S. Hertzog (subs.), J. Thompson Vann. *Ames*, Harvey C. Diehl (subs.), L. A. Underkofler. *Baton Rouge*, Cecil L. Brown, A. R. Choppin. *Binghamton*, Donald P. Germann (subs.). *California*, S. A. Ballard (subs.), Frederick Rust (subs.), W. E. Vaughan (subs.). *Central Pennsylvania*, A. J. Currier (subs.), N. B. Guerrant (subs.). *Central Texas*, Henry R. Henze, H. L. Lochte. *Chicago*, Howard Adler, M. H. Arveson (subs.), Weldon G. Brown (subs.), V. Conquest, James J. Doheny, Jr., L. M. Henderson, W. F. Henderson, Charles D. Hurd, Warren C. Johnson, Roger H. Lueck (subs.), L. E. May, E. E. Moore (subs.), Marjorie B. Moore (subs.), Marvin C. Rogers, B. E. Schaar, C. M. Suter (subs.), A. W. Weston (subs.). *Cincinnati*, John S. Brod (subs.), E. W. Eckey (subs.), W. H. McAllister (subs.), C. C. Ruchhoft. *Cleveland*, E. A. Arnold, H. S. Booth, Amos G. Horney (subs.), C. F. Prutton (subs.). *Colorado*, L. C. Atchison (subs.), H. B. Van Valkenburgh (subs.). *Columbus*, Cecil E. The Council voted to approve the minutes of the Atlantic City meeting as printed.

The Secretary read the following list of members reported as deceased since the Council met at Atlantic City, and the Councilors stood for a few moments in silent tribute to their memory:

Deceased Members

Aguilar-Santillan, Rafael
Arnold, Henry C. F.
Averill, Eugene A.
Blanc, Charles
Bliss, A. Richard, Jr.
Bollinger, Thomas W.
Branegan, James A.
Brown, Brian S.
Bush, James M.
Carpenter, Harry A.
Conlon, James J.
Cruser, Frederick V. D.
Currier, E. E.
Davis, A. B.
Dozier, Wilbur M.
DuPont, Francis I.
Eimer, August
Elliot, Thomas G.
Flanigan, George E.
Foote, H. W.
Francis, Francis E.
Freas, Raymond
Fuller, R. Clinton
Galewsky, Paul
Getman, Frederick H.
Grove, John M.
Hadley, E. R.
Hake, Donald S.
Harrar, Norman J.
Harrod, J. R.
Hayden, H. P.
Heckel, George B.
Henderson, Lawrence J.
Higbie, Ralph W.
Hills, Franklin G.
Ioannu, John H. P.
Iwanoff, Nicolai N.
Jackson, Daniel D.
Jahn, Francis P.
Johnson, Harold
Jones, G. H.
Kipp, Theodore
Kirschberg, Bradley H.
Knight, Charles M
Kresge, Robert E.
Lewis, Daniel C.
Lippincott, William L.
Lowy, Alexander
McElroy, K. P.
Mackie, Robert F.
Michael, Arthur
Miller, A. B.
Morse, Charles W.
Murphy, A. J.
Murray, W. C. R.
Nernst, Walter[1]
Nibelius, Axel W. T.[2]
Norton, T. H.
Noyes, William A.[2]
Park, Charles R.
Pensel, George R.
Perkins, Robert L.
Pincussen, Ludwig
Roberts, John A.
Schoenheimer, Rudolf
Scoville, Wilbur L.
Segerblom, Wilhelm
Shively, W. L.
Stafford, Orin F.
Surprenant, L. C.
Welin, John E.
Whedbee, Edgar
Wiener, Renee v. E. (Mrs.)
Wikoff, Alan G.
Willey, Leland M.
Yngve, Victor
Zimmer, Benedict F.

[1] Honorary member.
[2] Emeritus member.

At the direction of the President, the Secretary then read the following Statement of Condition of the Society:

The AMERICAN CHEMICAL SOCIETY assumes no responsibility for the statements and opinions advanced by contributors to its publications.
Published by the AMERICAN CHEMICAL SOCIETY, Publication Office, 20th & Northampton Sts., Easton, Penna. Editorial Office, 1155 16th St., N. W., Washington, D. C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

Statement of Condition of the Society

THE AMERICAN CHEMICAL SOCIETY is still growing in numbers, in prestige, and in influence, far more so than those who have been in closest touch with its progress had any reason to hope. It means that American chemists are more and more realising that the AMERICAN CHEMICAL SOCIETY is their friend, is interested in their welfare, is doing all it can to enable them to develop themselves, and that membership in the SOCIETY is a catalyst to success. Its efficacy is not always appreciated by indivduals who lack real professional consciousness.

The SOCIETY now has 30,400 members, of which slightly over 3,000 have joined in 1942. Inasmuch as our publications can no longer be sent to foreign countries and since payment cannot be received therefrom, there has been a loss of approximately 1,000 subscribers to the *Journal of the American Chemical Society*, 1,400 to *Chemical Abstracts*, 1,600 to *Industrial and Engineering Chemistry*, and 1,400 to CHEMICAL AND ENGINEERING NEWS. In spite of this, on April 1, 1942, there was the following increase in subscribers as compared with April 1, 1941: *Journal of the American Chemical Society* 60; *Industrial and Engineering Chemistry* 431; and CHEMICAL AND ENGINEERING NEWS 1,481. The subscription list of *Chemical Abstracts*, on the other hand, on account of large foreign circulation, decreased 342 between these dates. Income from subscriptions, since the increase was largely due to subscriptions at the special rates given to members, is so far approximately $7,000 less in 1942 than on the same date in 1941.

The Committee on the Professional Training of Chemists has collected complete lists of the students in our colleges and has sent a special questionnaire to these students for registry in the National Roster of Scientific and Specialized Personnel. At this meeting, the committee has been in session for four days and evenings, continuing its strenuous labors in studying and accrediting the chemical departments of our educational institutions. The SOCIETY owes the members of this commttee a debt of gratitude for accomplishments which are having, and will continue to have, a far-reaching effect on our professional standing and on the quality of the chemists and chemical engineers whose services are in future to be utilized by our country.

The Employment Clearing House is again functioning at this meeting, and continues to give unusual opportunities to members for contact with our best employers, thus rendering a service unsurpassed by any professional group. In order that those principles may be implemented, it is open only to employers who agree to the basic principles laid down by the Board of Directors in its action taken at Atlantic City on "Employer-Employee Relationships" (NEWS EDITION, 19, 1014, September 25, 1941). A number of firms have written the SOCIETY that they were carefully revising their salary lists of employees to meet at least the minima set by the Directors, and a number of firms have stated that they are, and have been, exceeding the salaries recommended for graduate chemists and chemical engineers. Reports coming from our colleges make it evident that the young men being graduated this year are receiving distinctly higher offers of compensation than in previous years. Unfortunately, this is not true of all employers and explains in part the number of individuals registering for employment, or change of employment, in the Employment Clearing House. Practically all of those registered are seeking change of employment, the number of unemployed registrants being negligible.

The AMERICAN CHEMICAL SOCIETY Committee on Cooperation with the National Defense Research Committee sent out a questionnaire last December, the results of which were embodied in "The 'Production Army' *vs.* the 'Combat Army'" which appeared in the February 10 CHEMICAL AND ENGINEERING NEWS. This, too, has had its influence on a desire for change of employment, but it has been especially helpful in convincing authorities directing the war efforts that there is a very serious scarcity of chemists and chemical engineers for the "Production Army", and that replacements for any who may be inducted are not available unless other serious vacancies are created.

Expenses for paper and printing are increasing. The Directors have found it necessary to modify the SOCIETY'S contract with the Mack Printing Co. to help meet additional costs forced upon the company in connection with labor and materials. Nevertheless, it is anticipated that with the increased support from American chemists we will again be able to balance our budget.

One of the SOCIETY'S most noteworthy accomplishments of the past year was the definite establishment of the full professional status of our members and the legal recognition of graduate chemists and chemical engineers as professional men. Today full membership in the AMERICAN CHEMICAL SOCIETY is a far better guarantee of professional standing and status than can be given by any state licensing board. Through the interest, encouragement, and support given by the AMERICAN CHEMICAL SOCIETY to its members at the Shell Development Co., Emeryville, Calif., it has been legally established that professional men cannot be forced to submit to inclusion in any organization controlled by heterogeneous groups of nonprofessional men. It is a decision of far-reaching importance to the chemical profession, as outlined in the article on page 165 of the February 10 issue of CHEMICAL AND ENGINEERING NEWS. The National Labor Relations Board decision, No. R-3245, and briefs containing a compilation of the laws governing these cases, are available to groups of our members who may be threatened with coercion. All of this was promised to the membership when the Committee on Economic Status was appointed. This committee has been exceedingly active and its report, presented at this meeting, will be published in detail in CHEMICAL AND ENGINEERING NEWS and reprinted as a separate document. It will bring much important and useful information to the chemical profession.

The Secretary's office has been especially concerned with, and active in, problems affecting the proper allocation of chemists and chemical engineers in the country's war effort. It is recognized and admitted that the normal place for chemically qualified men is in the Production Army. True patriotism requires them to serve there. Without them the combat forces simply cannot be supplied with the materials and implements of warfare. On the whole, Selective Service has functioned efficiently. General Hershey and his corps of assistants are exceeded in efficiency and intelligence by no other group in the Army or Navy. The local boards are made up of patriotic citizens and, in the main, of intelligent citizens. It would be surprising if all of the 6,600 local boards contained men who were capable of judging the importance to the war effort of graduate chemists and chemical engineers. Many mistakes have been made. Several hundred chemists and chemical engineers, including some with seven years of training and additional years of experience, have been inducted into the Army and are now functioning as stretcher bearers, orderlies, pharmacists' clerks, and in other necessary occupations but in which high school graduates could function with equal efficiency. As a consequence, their years of special training and experience are lost to the country. For reasons which no one can explain, there are apparently no channels in the War Department through which this manpower can be assigned to chemical work, either in the Production or Combat Armies. The situation is as serious as if graduates of West Point were assigned to the ranks as privates. All efforts to remedy this situation have completely failed, notwithstanding that the entire matter has been forcefully presented to high authority. In many instances also students of chemistry and chemical engineering have not been allowed to complete their courses. This procedure is certain to deplete future supply should the war continue. These mistakes, however, have been caused by a few of the local boards only and are not the rule. When appeals are properly made, and when details can be sent in time to Selective Service Headquarters, deferment for service in the Production Army is usually secured. Once inducted,

the best trained chemists and chemical engineers are simply "genus homo" and at present nothing can be done toward utilizing their special ability and experience in the country's service.

In contacting local boards, employers should call attention to Selective Service Memoranda I-347, I-398, and I-405. If the men who have been called in the draft are necessary men in work essential to the national health, safety, and interest and to the war effort, the employer should make every effort to see that deferment is allowed. If the local board refuses, the case should be appealed immediately to the Appeal Board. When an appeal is taken, but not before, if the employer will send to the Secretary of the AMERICAN CHEMICAL SOCIETY'S office a copy of Form DSS 42A used in the appeal, together with the selectee's number and local board number and address, the case will be referred to Selective Service Headquarters for such advice and recommendation as the premises may warrant. Such appeals, when justified, have usually been granted. Eliminating previously mentioned errors, chemists and chemical engineers of America, with the exception of those brought into the Army through their commitments as reserve officers, are engaged in the Nation's war effort where they feel they can serve best.

The AMERICAN CHEMICAL SOCIETY has today a list of 60,000 individuals, with data as to the training and experience of each, who believe themselves to be chemists or chemical engineers. It has been of inestimable value to the SOCIETY and has greatly helped to implement its aid to both the Production and Combat Armies.

It was reported that the Council Policy Committee had reached the unanimous conclusion that it would be unwise at this time to attempt to set any loci for 1945 meetings. It was further stated that no invitation had been received for the spring meeting of 1944.

The Council approved the petition for the formation of a local section with headquarters at Poughkeepsie, N. Y., to be known as the Mid-Hudson Section, with territory comprising the Counties of Dutchess, Orange, Putnam, and Ulster in the State of New York.

H. C. Urey and H. B. Hass were unanimously elected Councilors-at-Large to fill the terms of Per K. Frolich and Charles A. Thomas, expiring December 31, 1942 and December 31, 1943, respectively, Dr. Frolich having been elected President-Elect of the SOCIETY and Dr. Thomas Director-at-Large. Messrs. Urey and Hass received the next highest votes in the last election for the positions to which they have now been unanimously elected.

An amendment to the By-Laws of the Division of Biological Chemistry was approved. This amendment changes the term of office of the Secretary-Treasurer from one to three years and provides for his triennial rather than annual election.

On the unanimous recommendations of the Associate Editors of Scientific Monographs, Harrison E. Howe was elected to fill the unexpired term of William A. Noyes, deceased, Editor of Scientific Monographs, and on recommendation of the Council Policy Committee it was voted that the office be now designated "Editor of Monographs".

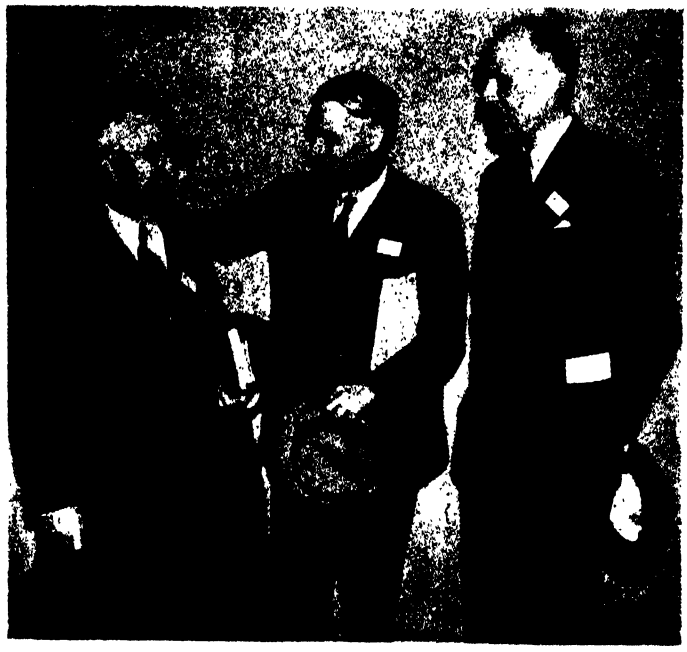
The Council instructed the Secretary to send a telegram of greetings to Editor Howe, who was unable to attend, to let him know that he was missed.

On recommendation of the Supervisory Committee on Standard Methods of Analysis, the Council adopted a revision of the Standard Methods for the Sampling and Analysis of Commercial Soaps and Soap Products, Revised (*Ind. Eng. Chem., Anal. Ed.*, 9, 2, 1937). The revised methods will be printed in the *Analytical Edition* of *Industrial and Engineering Chemistry*.

On recommendation of the Supervisory Committee on Standard Methods of Analysis, the Council adopted the revised specifications for F. A. C. Titer Test Thermometer as recommended by the Committee on Analysis of Commercial Fats and Oils.

A special vote of appreciation and thanks was given W. D. Collins for his many years of efficient accomplishment and hard work as Chairman of the Committee on Analytical Reagents.

Upon the recommendation of Thomas Midgley, Jr., Chairman of the Committee on Professional Status, the Council voted that the committee be disbanded with thanks.



The reports of committees for the year April 1941 to April 1942 were presented and approved and will be found on page 595 of this issue unless otherwise noted.

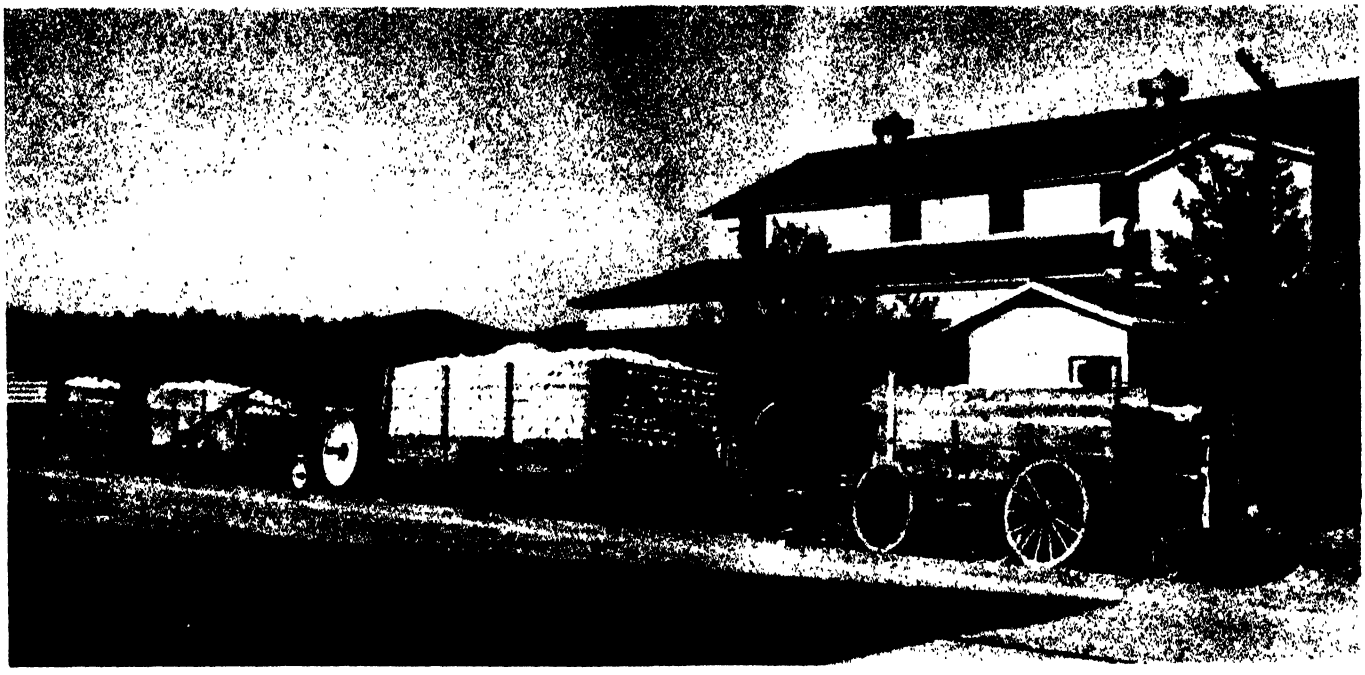
The Council voted that President Holmes be requested to appoint a committee of six to consider the feasibility and practicability of utilizing in this emergency the services of retired chemists, and to report its findings at the Buffalo meeting.

The Secretary was instructed to send the unanimous thanks of the Council to the local section officers, committees, and individuals who contributed to the success of the Memphis meeting.

The Council then adjourned.

CHARLES L. PARSONS, *Secretary*

Guardians of the A. C. S.—the most recent Past President Wm. Lloyd Evans, President H. N. Holmes, and President-Elect Per K. Frolich



Memphis Meeting Abstracts

A FEW sets of planographed books of abstracts of papers presented at the recent Memphis meeting are still available from the A. C. S. News Service, 1155 Sixteenth St., N. W., Washington, D. C. The price is 50 cents per copy if order is accompanied by remittance and divisional receipt card; $1.00 per copy if order is accompanied by remittance but without receipt card; and $1.50 if bill must be rendered.

Harry E. Barnard Honored

THE Division of Agricultural and Food Chemistry honored its oldest living Past Chairman, Harry E. Barnard, at a complimentary luncheon at the 103rd meeting of the AMERICAN CHEMICAL SOCIETY in Memphis. Chairman E. H. Harvey presented a certificate commemorating the 30th anniversary of Dr. Barnard's chairmanship of the division, together with a bound volume of congratulatory letters received from students, professional associates, and old friends who were unable to be present.

Many past chairmen of the division were present. Secretary Parsons, Dr. Barnard's first teacher in chemistry and a close personal friend during the last 40 years, briefly reminisced about their early days in New Hampshire.

Cotton—Yesterday, Today, and Tomorrow[1]

HENRY G. KNIGHT

Bureau of Agricultural Chemistry and Engineering, United States Department of Agriculture, Washington, D. C.

Up to the present the work of mechanical and textile engineers has been more influential than that of chemists in the development of the cotton-textile industry. Nevertheless, the contributions of chemistry have been most essential to this development.

The principal applications of chemistry in the cotton-textile industry have been in the bleaching, dyeing, and finishing of fabrics to make them more attractive, more useful, and more durable. The chemical treatments used to accomplish these ends may be classified into four groups, according to the manner in which they affect the fiber:

(1) Treatments that take undesirable substances out of the fiber, exemplified by scouring and bleaching;
(2) Treatments that add something to the fiber without altering the chemical composition of the underlying cellulose, exemplified by dyeing;
(3) Treatments that help to modify the form and density of the fiber, such as mercerization;
(4) Treatments that actually change the chemical composition of the fibers, without changing their form, exemplified by acetylation.

Scouring or purification of cotton goods, an example of the first group of treatments, is accomplished by a process known as kier boiling, which removes natural fats and waxes, mineral matter, and protein and pectic substances, together with any oil or grease acquired by the yarn during spinning and any warp-sizing materials present in the woven fabrics. In the early days of the industry cotton fabrics were sometimes bleached by the method used for linen—that is, by exposure to air and sunshine. It was later discovered that chlorine dissolved in lime water was more effective and by 1830 chlorinated lime became available in the form of a fairly stable powder. Since then most cotton fabrics have been bleached for use as white goods and in preparation for dyeing and printing.

The dyeing of cotton goods and other fabrics was originally an empirical process limited to the application of one of a few natural dyestuffs, after mordanting with a heavy metal salt (sometimes over tannin extract) to set the color. The first direct cotton dye (Congo Red) was used in 1884 and the first important azoic dye (Para Red) in 1889. Synthetic indigo became available in 1880, and other vat colors during the first decade of the present century.

Today, dyeing is a carefully controlled chemical process for which a vast array of synthetic dyestuffs of different classes, with appropriate mordants and fixing agents, developers, or other dyeing assistants for each class, have been made available through chemistry. Dyestuffs and printing colors and methods for applying them are among the most important contributions which chemists have made to the cotton-textile industry. The pleasing and permanent colors we have today are no doubt among the most important factors governing utilization of clothing and household fabrics.

In addition to dyeing and printing, other additive finishing treatments are often applied to cotton fabrics to impart properties that will make them more useful for special purposes or otherwise more acceptable to consumers—for example, mildewproofing, waterproofing, and fireproofing treatments. Substances can now be added to cotton fibers to make them resistant to mildew and other microorganisms which destroy cellulose, and occasionally chemicals are added to retard burning. But unfortunately the more effective flameproofing or so-called fireproofing agents are soluble in water and therefore easily removed by rain. Substances have also been added to cotton fabrics to make them water repellent.

Besides the additive finishing treatments for imparting mildew resistance, flame resistance, and water repellency to cotton textiles, there are many treatments of this class designed for special purposes. Some are applied to fabrics used for wrapping silverware or lining silver chests to make them absorb sulfur gases from the air and thus protect the silver from tarnishing. Others are intended to make cotton fabrics useful as substitutes for leather. And still others are intended to impart softness, stiffness, smoothness, luster, or some other special property to cotton fabrics.

[1] Abstract of an address before the general meeting at the 103rd meeting of the AMERICAN CHEMICAL SOCIETY, Memphis, Tenn., April 20 to 23, 1942.

The recent introduction of new chemical products, such as cellulose esters, cellulose ethers, synthetic resins, and other plastics, has made possible the development of new additive finishes for cotton clothing and household fabrics that are not removed by washing. Application of cellulose compounds to cotton fabrics has resulted in greatly improved materials for window shades and other uses. Another process, which prevents creasing and crushing of cotton fabrics, comprises the application of synthetic resin in an intermediate stage within the fibers, the resin on the surface being subsequently removed as completely as possible. By means of alkali-soluble cellulose ethers various permanent finishes have been imparted. One is a glossy finish like that of glazed chintz, and another is a finish having the appearance and feel of linen.

Mercerization is one of the most interesting and important of all the chemical treatments. The process, discovered by John Mercer in 1850, alters both the form and appearance of the cotton fiber. It causes the fabric to shrink considerably, but increases its strength and also the affinity of the cotton for dyestuffs. In this process the individual fiber, which ordinarily has the form of a flat twisted ribbon, swells, becomes almost cylindrical, and acquires a rough surface. One of the purposes of this treatment is to strengthen the fabric and permit dyeing to deeper shades. About 1890 it was discovered that under tension the fibers, which are distended and apparently softened by mercerization, are straightened and become smooth and lustrous. So today the mercerizing treatment is applied to cotton yarns and fabrics to give luster, as well as to increase strength and affinity for dyes.

There are only a few chemical finishing treatments for cotton of the fourth class—those that actually change the chemical composition of the fiber, without changing its form. Examples of such treatments are: acetylation of the cellulose fibers to produce cellulose sulfonic acid or other cellulose ester on the fiber surfaces, and production of a mixed ether of cellulose on the fiber by treating with a substituted quaternary ammonium salt and sodium acetate and decomposing the intermediate product with moderate heat.

These treatments, which actually change the composition of the fiber by producing cellulose compounds on the surface, open up a new field of research in chemical finishing of cotton textiles which invites further investigation.

In the United States the growing, handling, manufacturing, and utilization of cotton are closely entwined with our daily lives; in truth, it is a *part* of our very existence. This being so, the answer to the question of what the future holds for the cotton industry is of deep concern to everybody.

It is difficult to conceive of an industry so huge as the cotton-textile industry and producing such a wide variety of products, as not being prosperous during the extravagant years of the late 1920's. And yet the industry as a whole was not prosperous during that period.

The depression beginning in 1929 came when the industry was ill-prepared to do little more than try to keep losses at a minimum and wait until our national economy should take a turn for the better. There were signs of revival in the middle thirties, but by then new factors had come into the picture. So-called artificial silk, today universally known as rayon, was fast becoming a textile fiber of importance. Paper had acquired a strong foothold in many important uses, such as bags for food products and cement, where cotton and its competitor, burlap, had once reigned supreme. In the offing were nylon, vinyon, fiberglas, and other man-made fibers ready to enter the textile field. And here is a significant fact and a broad hint to the cotton industry—all these competing textile materials are the outgrowth of research. The cotton industry might not have suffered such an economic setback if it had put more faith in research and pushed it as hard as research was pushed by the developers of these competing synthetic fibers.

The present war prosperity, shared in full by the cotton-textile industry, tends to obscure the real condition of this industry. For decades leaders both in and out of the industry have pleaded strongly and worked tirelessly for an expanded research program to prepare the industry for the inevitable competition from textiles and other products which are better meeting the public needs for many uses. Many organizations of a private, public, and semipublic nature are now undertaking research on cotton. The Southern Regional Research Laboratory of the Bureau of Agricultural Chemistry and Engineering, United States Department of Agriculture, the National Cotton Council, with headquarters in Memphis, the Cotton Textile Institute, the Textile Foundation, the United States Institute for Textile Research, the American Association of Textile Chemists and Colorists, and many state and private universities, are either conducting or sponsoring research to increase the utilization of cotton. A few of the larger textile mills have organized their own research departments to improve the quality and lower the cost of their products.

Obviously, the properties of yarns and fabrics depend ultimately on the physical and chemical properties of the individual fibers. Although man has been remarkably ingenious in devising machinery for spinning and weaving cotton into fabrics with an almost unlimited variety of properties, he has been making use of cotton's inherent fiber properties in only an empirical manner. By trial and error he has found that cotton of certain varieties grown in certain localities is suitable for, say, tire cord, while other varieties grown in other localities are not. Moreover, there are comparatively few fabric uses for which even an empirical relationship of this nature has been established. Such a condition has existed partly because use requirements, in general, have never been carefully and systematically studied, and partly because only a few of the relevant fiber properties have been known or measurable.

Various scientists who have studied the structure of the cotton fiber have reported that the cellulose wall is made up of layers of fibrils alternately spiraling in opposite directions, but roughly parallel to the axis of the fiber. Studies of the fiber with all available facilities have led to the belief that the cellulose of cotton fibers exists in two forms—amorphous and crystalline. The general concept of the submicroscopic structure of cotton cellulose is that in some places the long-chain cellulose molecules are arranged substantially parallel to each other in parallel groups, or micelles, which are crystalline in character, and that some portions of molecules cross from one group to another through regions of porous or amorphous matter. The proportion of the cellulose molecules arranged in crystalline alignment determines the relative strength of the fibers. The cause of lower strength of cotton fibers, as compared to flax, ramie, or hemp, is the lower proportion of cellulose in crystalline structural alignment.

While the naturally poor alignment of cotton fiber is a fault from the tensile strength standpoint, it is advantageous from other standpoints. That cotton is one of the least brittle of vegetable fibers may be ascribed to the considerable proportion of amorphous cellulose, which in turn seems to be related to the poorer alignment of cellulose molecules. This lack of brittleness makes it possible for cotton fiber to withstand continued shock or impact—such, for instance, as in automobile tires—to a far greater extent than many other plant fibers.

Intensive and more comprehensive research is needed to explore the various physical and chemical properties of cotton fiber, to disclose their interrelationships, and to devise better means of measuring many of them, so that all these properties may be utilized in the best possible way. Sufficient research has already been done along this line to demonstrate its real value in connection with the development of new and improved cotton products. This is true not only from the standpoint of mechanical processing, but also from that of developing new and improved chemical treatments to alter or enhance the properties of cotton products.

There are many unsolved problems associated with the development of new and improved cotton products affecting mechanical processing machinery. Research on the development of cotton prod-

ucts is not new. The cotton-textile industry from its beginning has developed many hundreds of products. But very few of these have been developed by the use of scientific methods to determine the requirements for specific uses. This was only natural in an industry which during its growth period found markets for almost any type of staple fabric which could be produced. But today, considering that the present war demand for textiles is temporary, the industry is facing an entirely different problem. Competition from other fibers and products is keen and any further expansion of markets, or even the holding of some of the present markets, can be accomplished only by intensive research aimed at developing new and improved cotton products for specific uses.

The procedure involved in this type of research is quite straightforward, and its effectiveness is limited only by the extent of man's ingenuity. Three principal steps are involved: first, the determination of permissible cost and the basic physical and other requirements of the particular use being studied; second, the experimental development of a cotton product designed to meet the requirement of the use; and third, laboratory and service testing to determine whether the experimentally developed product meets all use requirements. Repetition of these steps, where necessary, finally leads to the development of a satisfactory cotton product or to a reliable conclusion that such a development is not feasible.

Although it may seem obvious that such a procedure is the one and only logical method to be followed in developing new and improved cotton products, this has not been the general procedure in the cotton industry. However, there have been a few notable exceptions which definitely establish the effectiveness of this type of research. Tire fabric is an outstanding example of a cotton product, which, during its entire history, has been developed into a better and better product by the use of scientific methods with attention focused directly on the *use* requirements. Open-mesh cotton bags for handling fruits and vegetables are another example of a widely used cotton product developed in this manner. Research of this nature must be both broadened and intensified. The results obtained will be a major factor in determining the future of the cotton industry.

Within recent years more research has been done on chemical finishes than in any other field. This does not mean, however, that more research of this nature is not needed or that opportunities for increasing the utilization of cotton in this manner have been lessened by the results already obtained. Precisely the opposite is true. Instead of lessening these opportunities, recent progress in the development of new and improved chemical finishes has actually indicated new opportunities which 10 years ago were only in the realm of speculation. The possibilities of some of these newly developed finishes have been only partially explored, and the introduction of new types of finishes serves only as a stimulus for the discovery and development of other types.

The needs with regard to chemical finishing include more effective finishes for some purposes, and more permanent and less expensive finishes for most purposes for which finishes are now applied. Also, new kinds of finishes will be needed to produce new effects in cotton textiles to adapt them to uses now served by other fibers or to other uses not yet conceived. A few specific examples of research needed in chemical finishing might be mentioned. There is a need for more research on mildewproofing, especially for clothing fabrics where it is desirable that the appearance, feel, and draping properties of the fabrics be unaffected. There is need, too, for improvement in making wearing apparel water repellent, and for new treatments to replace the rubber coating and rubber impregnation treatments so extensively used in the past to make hospital sheeting and other fabrics impervious to water. Finally, since cotton is competitive with rayon, nylon, and other synthetic fibers in many uses, finishes must be developed which will give to cotton fabric as many as possible of the properties of the fabrics made from these other fibers.

The Southern Regional Research Laboratory at New Orleans, one of the four laboratories recently established by Congress to develop larger industrial outlets for farm products, is giving most of its attention to cotton. An extensive program of research has been planned to increase the utilization of cotton and cottonseed products. The program for cotton includes research on the fiber, on mechanical processing, and on chemical finishes. Each branch of research is handled by a separate group or division.

The objective of the first group, the Cotton Fiber Research Division, is to determine the relationships between the chemical and physical structures and properties of cotton fibers and the characteristics desired in textiles for specific uses, and to learn how to improve cotton fibers for specific textile and other uses by changing them physically or chemically.

One objective of the second group, the Cotton Processing Division, is to determine the physical requirements of a textile for a specific use, regardless of the particular kind of fiber that may have been used in the past, and then to learn how to meet these requirements as fully as possible with cotton, by controlling the properties of the yarns through necessary mechanical processing and those of the fabrics by employing suitable weaving patterns. Another objective is to improve and develop cotton-processing machinery through better application of basic mechanical principles in order to reduce cost and improve quality of products.

The objective of the third group, the Cotton Chemical Finishing Division, is to improve additive and modifying finishing methods which will impart the properties most desired in textile products for specific purposes.

The research work on cotton at the Southern Laboratory and, in fact, all of the work of the Bureau of Agricultural Chemistry and Engineering of which it is a part, is now specifically directed toward aiding the Nation in the war effort. Most of the projects which would require several years to yield useful results have been deferred until the end of the war. Short-time special projects of a defense nature are given precedence over all others.

One accomplishment of this special war work is the development of means for cutting cotton to uniformly short lengths so it can be used with existing commercial equipment to supplement linters for making smokeless powder. Some of the objectives of present war work are: plastic-coated or impregnated fabrics for replacing rubberized fabrics; an unlined cotton fire hose to replace linen hose of the same type; rotproofing treatments suitable for commercial application to cotton fabrics for sandbags and revetment covers; improved mesh fabric for use as a base for transparent plastic substitutes for window glass; the development of cotton products to replace those made from imported fibers; and other projects which cannot be mentioned on account of their defense nature.

Up until around a year ago there was a great deal of discussion about the future of the whole cotton industry. Because of low prices and mounting surpluses, the outlook was not very encouraging. But the war has changed the appearance of the picture almost overnight. Instead of the low prices that existed 18 months ago we are now enjoying the most favorable prices that we have had in years, with domestic consumption at the highest level in history, and some feel that because everything is all right now our cotton troubles are over.

But that is not the case. The temporary relief and prosperity that we are now enjoying is like a shot in the arm, the effects of which will die out when the war is over. So instead of relaxing and feeling that our troubles are over we should take advantage of the present favorable situation by pushing constructive *research* so that the throne which has been recently threatened by paper, rayon, and other synthetic fibers will be made safe for King Cotton.

The Chemist's Place in Civilian Defense

COLONEL A. GIBSON

Inspector, Office of Civilian Defense, Chemical Warfare Service, U. S. Army, Washington, D. C.

WHAT is the place of the chemist in Civilian Defense?

There is scarcely an important phase of modern life in which chemical science and the chemist do not play a vital part. It is, therefore, but logical to expect the chemist to have a decidedly important role in Civilian Defense. He has.

What is Civilian Defense and what is the chemist's role therein?

The President, when he proclaimed April 6 as Army Day, said in part:

> That day means more than ever to us this year. We are fighting an all-out war in defense of our rights and liberties. Army Day becomes, therefore, in fact a *total-war day*. It becomes a day when all of our citizens in civil pursuits can rally to the support of our armed forces, for only in the united effort of all of our forces—Army, Navy, and civilians—can we find the strength to defeat our enemies.

Mark these words "total war". That term has been used to characterize modern wars since the Germans in 1870 attempted to mobilize the entire people, to constitute a nation in arms. However, not until the present war did the term "total war" gain full significance. Never before has there been a total war. We are in one now, the first in the history of the world. Every man, woman, and child in the warring nations is either a potential victim or an active productive member of his country's war machine.

Naturally in time of war our eyes are focused upon the fighting forces and the military front, whether on land, on sea, or in the air. That constitutes the spectacular part of the national effort. The President's statement brings out the importance of the civilian element in the national fighting team in which the Army, Navy, and civilians are integral parts.

The civilian part of this team, the home front in contradistinction to the military front, is the province of the Civilian Defense Organization. The home front is as important as the military front; in a sense, more important. Recent events justify that statement. For instance, if the military front is broken, readjustments can be made, a line reformed, an army evacuated, and the war can still be won, provided the home front morale is high and the determination to win is uppermost in everyone's mind, and everyone is doing his or her bit to win. But if the home front crumbles, no matter what the cause, everything goes with it—Army, Navy, and every weapon. We witnessed that in the case of Germany in the last war.

Many activities comprise the home front embodied in the so-called Civilian Defense Organization but I will discuss only that portion of Civilian Defense which deals with protective measures, organized, trained, and operated by communities. This form of protection is the outgrowth of total war which brings the destructive effects of the battlefield into the homes of the civil population. Distance is not of necessity a guarantee against such a contingency. Furthermore, war is never static, and wisdom dictates the need of providing against possible disaster.

Planning against such a possibility started in this country in May 1941, when the Office of Civilian Defense was created by a Presidential Executive Order, dated May 20, for the purpose of providing, among other things, for "effective coordination of federal relations of State and local governments engaged in defense activities, and to provide for necessary cooperation with State and local governments in respect to measures for adequate protection of the civilian population in emergency periods".

The first problem that confronted the Office of Civilian Defense was to decentralize its activities to ensure effective action at the state and local level. This was accomplished by the creation of regional areas coterminous with War Department Corps Areas, with regional offices in the same cities as Corps Area Headquarters. This pattern was used because of the desirability of tying in as closely as possible with military commanders to ensure that our plans conform to military requirements, such as blacking out areas directed by the Army and to ensure no embarrassment to military activities.

Representation of other agencies of government is taken care of in the membership of the Board for Civilian Protection, which is provided for in the Executive Order as an advisory body. Departments and agencies represented on this board include the War Department, Navy Department, Department of Justice, Federal Security Agency, American Red Cross, Council of State Governments, American Municipal Association, and United States Conference of Mayors. The field representatives of these departments and agencies are also included on Regional Boards for Civilian Protection which operate in an advisory capacity for each Civilian Defense Region. This representation provides an excellent medium for consideration of defense problems involving federal agencies, as well as state and local governments.

The next echelons are the state governments, through their State Defense Councils. One of the principal missions of State Defense Councils is to assist in the organization of local defense councils, which in turn are responsible for the organization, training, and operation of the Citizens Defense Corps, the final echelon.

The greatest effort must be placed at the local level where planning and operation merge, as this may become a battle-front. In other words, a community where many people live, whether or not military objectives are located therein, is the place the enemy selects for bombing; not the State or the county, but a congested, pulsating beehive of humanity.

British experience shows that the most destructive elements involved in a bombing raid are the fires resulting from the use of incendiary bombs, which cause not only the greatest destruction of property, but loss of life as well. Therefore, the basis of the protective organization, known as the Citizens Defense Corps, is built around those protective services and facilities normal to any community, such as fire, police, medical service, public works, and utilities. These must be augmented by volunteer units created for specific jobs, such as:

Auxiliary firemen to handle the auxiliary firefighting equipment.

Rescue squads which usually operate under the jurisdiction of the Fire Department.

Auxiliary police to handle special police problems, war traffic control, etc.

Emergency Medical Service, such as medical teams for Hospital Field Units, Ambulance Units, Casualty Stations, and First Aid Stations.

Public Works, such as demolition and clearance crews, road repair squads, decontamination corps, water supply including emergency repair and water mains, sewerage disposal and repair.

The various utilities must organize and equip crews for repair of gas mains, transmission lines and power stations, transportation and communication systems.

In addition to the above an entirely new service must be created known as the Warden Service, which permeates the entire organization, extending to warden posts serving approximately each group of 500 people. The Warden Service must win and hold the confidence of the people. It is the key service in relating the protective system to the people. It directs people to shelter in an air raid. It clears the streets. It instructs and places the

[1] Abstract of an address presented before the general meeting at the 103rd meeting of the AMERICAN CHEMICAL SOCIETY, Memphis, Tenn., April 20 to 23, 1942.

fire watchers. It takes charge when bombs drop, creating an incident. Wardens call for and direct the other services to the points where they are needed. They direct nonmedical bombing victims to rest centers or other points of assembly where emergency food and housing units take charge.

Finally, these various services must be tied together, for no matter how well they may be trained in their particular specialty, they cannot function efficiently in an emergency except as a team. Therefore, in every community where a Citizens Defense Corps is organized, there must be a commander duly authorized by appropriate city ordinance to train and operate the team. He must be empowered to appoint an operating staff to assist him. Communication facilities must be set up and centralized in a Control Center which constitutes the nerve center of the entire organization and is a part of the commander's headquarters. In the Army we call it the "Message Center". The Messenger Service and Drivers Corps are operated by the Message Center.

The local defense council cannot exercise command, nor any other group of individuals. Command is a one-man function. Any other system is doomed to failure. There must be no divided responsibility.

To complete the organization, the Citizens Defense Corps must have certain equipment to accomplish its respective tasks. Auxiliary firemen must be furnished with auxiliary pumpers, hose, axes, ladders, lanterns, and similar items, together with protective clothing. Special firefighting equipment of a simpler character, such as so-called hand pump tank extinguisher and related equipment, must be supplied for each city block. Medical supplies and equipment must be provided for the various medical echelons; steel helmets, for various enrolled workers; and distinguishing arm bands, for all; protective clothing for use of decontamination squads as a precaution against the extremely remote contingency that war gas might be used; and, by the same token, a limited number of gas masks for training purposes.

Congress has recently appropriated $100,000,000 and, under the provisions of the act, arrangements are being made with the War Department for the procurement of this material for loans to designated communities selected on the basis of the importance of their industries from a war production standpoint and their exposed location. The War and Navy Departments have been consulted in the determination of these priorities. Protection requirements of these localities will be met to the limit of available funds. A considerable portion of these funds is being used to create facilities for mass production of gas masks for the civilian population in case of need.

Further assistance is being rendered by the national office through a system of Civilian Defense Schools being set up in various universities throughout the country, where individuals selected by communities may be sent for courses of instruction in gas protection, handling the incendiary bomb, and the method of organizing, training, and operating the Citizens Defense Corps. Those selected to attend these schools should be able to assume leadership in their local communities in establishing local schools in setting up defense organizations.

Finally, and of equal importance, is the problem of educating the public as to the purpose of this organization and the part each individual must play, even though not enrolled as one of the workers. I refer to the responsibilities of the householder, the management of hotels, theaters, stores, restaurants, schools, etc., for protecting their property and the people assembled there in event of an air raid and the mutual responsibilities of individuals to each other and to the community at large. Everyone must willingly curtail certain liberty of action. They must know the scope of the organization and its purpose. They must know their post air raid warden. They must participate in the frequent tests that are needed to ensure efficient operation of the team.

Panic is more destructive than enemy bombing. It evidences a complete disintegration of the morale of the people. The predisposing cause of panic is complete unpreparedness to meet emergency situations. The correction of such a condition can be brought about only through an organization of the people such as outlined, which, when properly trained, equipped, and led, will enable localities caught in the sudden, crushing impact of an air raid, to function with the confidence, spirit, and resolution traditional of our people.

Chemical or gas attacks would have for their main purpose the creation of panic. Chemists may be the most potent means of preventing or allaying this panic. Here is the chemist's role.

A clear and succinct answer to where chemists fit into Civilian Defense would seem to be apparent from a study of the table on page 586.

Note that 15 categories of personnel are listed in the Enrolled Volunteer Groups. Note also that the personnel of each group or service is required to take certain specified training courses, indicated in column two, for award of insignia. Bomb Squads are omitted since that is to be a military activity handled by the Ordnance Department.

Each enrollee must take a course in Gas Defense. Most of them likewise must take a course in First Aid and in Fire Defense. In each of these three most important courses the knowledge and instructional experience of the chemist are tremendously important. It is hardly conceivable that a really efficient course in any of these subjects could be conducted without the cooperation of the chemists in the region covered by the school.

The chemist must play a major role in the organization, training, and functioning of Decontamination Squads.

We do not have personnel especially trained for gas detection by means of gas analysis apparatus, field type, as in England. When and if this addition is made to any categories of specialists, the chemist will have an additional important field and role.

How does the chemist find his place in his local Civilian Defense organization? By volunteering and by helping those in charge of enrolling volunteers to understand the contribution which the chemist can make and where and how his services would be most valuable.

If gas is used we shall possibly have a sudden and excessive demand for chemists unless each community has in its anticipatory planning and training made full use of all available chemists. Help your local organization to plan and train now to avoid being caught unprepared chemically. This is a most valuable contribution. The possibility of panic can be forestalled by making clear in talks and symposia that gas is not the fearsome weapon most of us have imagined it to be. In reality it is one of the most readily protected against by proper training (emphasize the training) and one of the most relatively humane of all weapons (if the term "humane" can be applied to a weapon of war).

The service is providing a very fine standardized lecture on incendiaries with sketches and a list and description of experiments which may be conducted readily by any trained chemist as a most interesting contribution to the instruction as well as the entertainment of the citizens of his community. All high school and college professors and chemists in general are urged to consider using this standardized lecture as a basis for a far-flung system of enlightening and most entertaining talks that will give their fellow citizens a background knowledge of incendiaries that will facilitate greatly their training in fighting fire bombs.

Chemical science, and chemical industry based thereon, constitute an all-pervading and a major influence for good or ill in the civilization of today. *We live in a chemical age.* However, in the matter of Chemical Warfare, the chemist is often held up to scorn as having prostituted a noble science to the destruction or maiming of human beings. Even some of our chemists have this plausible but most erroneous idea.

Why was Chemical Warfare initiated in the World War? Chemicals were and are used in war because man from the earliest times in employing force against an enemy

VI. Summary of Training Requirements[1]

Group or Service	Basic Training Required for Award of Insignia	Hours	Special Duty Training Required for Award of "First Class" Rating	Hours if Estimated
Staff	First Aid (10 hours); Fire Defense A; Gas Defense A; General Course	20	Map reading; municipal organization; utilities; city geography; law of authority; staff operation and functions; messages and reports; inspections and reviews	Not estimated
Messengers	First Aid (10 hours); Fire Defense A; Gas Defense A; General Course	20	City geography; black-out training; message procedure	Not estimated
Drivers	First Aid (10 hours); Gas Defense A and B; General Course; Drill (2 hours); Night and Convoy Driving; Black-Out Driving; Map Reading; Emergency Road Repairs; Test and Optional	40	Training exercises and volunteered work; test to be arranged by local authorities	Not estimated
Auxiliary firemen	First Aid (10 hours); Fire Defense A and B; Gas Defense A; General Course	27	Special initial training; advanced training; supplemental training (see sec. V)	50
Rescue squads	First Aid (20 hours); Fire Defense A and B; Gas Defense A and B; General Course	40	Special training course (see sec. V)	40
Auxiliary police	First Aid (10 hours); Fire Defense A; Gas Defense A and B; General Course	23	Special training course (see sec. V)	50
Air-raid wardens	First Aid (10 hours); Fire Defense A; Gas Defense A and B; General Course	23	Special training course (see sec. V)	Not estimated
Fire watchers	Fire Defense A; Gas Defense A; General Course	10	Knowledge of sector; methods of observation; reports	6
Emergency food and housing	Gas Defense A; General Course	7	Recommendation of unit leader, approved by Chief Air Raid Warden, after operation (see sec. V)	Not estimated
Medical auxiliaries	First Aid (20 hours); Gas Defense A; General Course; plus special training as is directed by the Office of Civilian Defense	27 plus	None announced	None announced
Nurses' aides	First Aid (10 hours); Gas Defense A; General Course; plus Nurses' Aide Course of American Red Cross	17 plus	None announced	None announced
Demolition and clearance	Fire Defense A; Gas Defense A; General Course	10	Issued after actual training exercises, upon recommendation of Crew Leader and approval by Chief of Emergency Public Works	Not estimated
Road-repair crews	Fire Defense A; Gas Defense A; General Course	10	Issued after actual training exercises, upon recommendation of Crew Leader and approval by Chief of Emergency Public Works	Not estimated
Decontamination squads	First Aid (10 hours); Gas Defense A and B; General Course	20	Issued after actual training exercises, upon recommendation of Squad Leader and approval by Chief of Emergency Public Works	Not estimated
Utilities-repair squad	Gas Defense A; General Course	8	Issued upon recommendation of Squad Leader, with the approval of the Chief of Emergency Utilities	Not estimated

[1] Reprinted from "Training Courses for Civilian Protection (Enrolled Volunteer Groups)", Civilian Defense Publications, page 28.

has made use of whatever his natural resources, his development in art, science, industry, and his inventive ability made available. When the chemical industry reached a suitable point of development, chemicals became a weapon of war. As a matter of fact chemistry has been a major factor in warfare since the introduction of gunpowder on the battlefield in the 15th century.

The War of the Rebellion official records of the Union and Confederate Armies show that we in America strove unavailingly to be first in this field. One of the knightliest of General Lee's officers, Brigadier-General W. N. Pendleton, chief of Artillery of the Army of Northern Virginia, who was afterwards a revered Episcopal minister of Lexington, Va., sought in 1864 to obtain by requisition from the Chief of Ordnance, General Baldwin, gas shell to be used against the Union forces. The Chief of Ordnance could not furnish them. The chemical industry of the Confederacy was not equal to the demand. General Lee's army might, otherwise, have been the initiator of chemical warfare.

The supposition that gas would be more cruel than other weapons has proved notoriously false. We cannot, of course, be sure that if gas is used in the present war its general characteristics and effects will be as in World War I. We can, however, be reassured by that experience. Statistics show that chemical warfare is the most effective force yet devised by man, with relatively slight destruction of life and property, and minimum of human suffering and aftereffects.

Since World War I gas has been used effectively by the Italians in Ethiopia and on a limited scale, probably as a test or experiment, by the Japanese. You quite logically ask, why has not gas been used in World II? Is it probable that it will be used?

To the first question a number of reasoned replies may be furnished. Gas is a surprise weapon. It was used prematurely in World War I, before adequate amounts had been provided and adequate tactics and technique developed. It failed as a decisive tactical weapon by reason of this premature disclosure. Tanks were likewise used prematurely and therefore failed in decisive surprise. All military schools of the world have emphasized the importance of avoiding this error in future.

We, of course, do not know but it is a reasonable possibility that gas may be reserved by Hitler for a decisive surprise all-out attack against England. At any rate our only sound and reasonable line of action is to be completely prepared against chemical attack in technique, equipment, training, and psychological attitude. To do less will tend to invite enemy use of gas against us. To do that much will tend to mitigate, if not to prevent, gas attacks. To accomplish this we depend in a large measure upon American chemists. Not only the chemists but each citizen, however humble, however exalted, has a definite, specific, hard task, but a glorious

task, a personal effort and sacrifice, to sustain the cause of human liberty.

We are living through one of the two or three most critical periods in the whole of human history. Do we grasp its significance to our country, to humanity?

In conclusion, I quote the soul-stirring words of a great and noble leader:

I have nothing to offer but blood, toil, tears, and sweat.

Not only great dangers, but many more misfortunes, many shortcomings, many mistakes, many disappointments will surely be our lot. Death and sorrow will be the companions of our journey; hardship our garment; constancy and valour our only shield.

Come then: let us to the task, to the battle, to the toil—each to our part, each to our station. Fill the armies, rule the air, pour out the munitions, strangle the U-boats, sweep the mines, plough the land, build the ships, guard the streets, succour the wounded, uplift the downcast, and honor the brave. Let us go forward together in all parts of our Nation. There is not a week, nor a day, nor an hour to lose.

Our Southern Exposure

MEMPHIS, we learned by experience and by information, means "place of good abode", being derived from the ancient Egyptian. Further, Memphis is located in the southern part of the district known as "little Egypt" from its useful floods.

* * *

SOUTHERN hospitality attained new meaning to chemists who were taken to the hearts of Memphians.

Even the ducks in the fountain at the Peabody joined with welcoming quacks. Fortunately no chemist carried out the threat to add duck-sinking wetting agent to the fountain.

* * *

SUNDAY'S early arrivers found sightseeing about the city delightful under the guidance of well-qualified porters from the Peabody.

* * *

INCIDENTALLY, pronunciation and dialect difficulties cropped up to harry New Englanders, who often needed interpreters. The name of the headquarters hotel requires accent on the second syllable and not on the first as the word is pronounced in Boston. Elision of the second "m" in Memphis by Southerners also caused some trouble.

* * *

OFFICIALLY the meeting began with registration on Sunday afternoon and an informal reception in the evening.

* * *

MONDAY'S Council meeting fulfilled its functions with harmony and dispatch. Harry N. Holmes arrived on time; that is, before President Holmes opened the meeting.

* * *

FOR the record: Sixteen divisions met; Fertilizer and Rubber Divisions absent; 331 papers by 517 authors; 13 symposia; 61 group meetings with meals or cocktails; 10 plants scheduled for visits, 8 plants visited.

* * *

TRANSPORTATION troubles, both coming and going, emphasized the incidence of war and the conservation of tires which reduced automobile travel to a new low. Gasoline was plentiful in Memphis, but not tires.

* * *

NOVEMBER 6th Street in Memphis does not commemorate a military event, but was named for the date of a political victory, politics being a major interest of Memphians.

* * *

MEMPHIS' Mayor Chandler was unable to welcome chemists to his city because he was in New York receiving an award for the safety record of his city, safest in the Nation through traffic regulation. That regulation was duly impressed on visitors at every street intersection where waiting for the light was universally enforced, even on New Yorkers.

* * *

COMING of chemists was duly impressed on guests of Memphis hotels before the meeting by cards stating that each room was reserved for the A. C. S. All hotels in Tennessee and neighboring states had notices posted advising travelers to avoid Memphis April 20 to 23. Chemists decidedly did not heed them.

* * *

BRIDE and bridegroom of the meeting were Dr. and Mrs. C. S. Hudson, married in Birmingham, April 18. Mrs. Hudson admitted to being a childhood sweetheart of the Washington chemist.

* * *

MEMPHIS' jail, from the outside, was surprisingly like a college library. No chemist reported seeing it from the inside.

Hostesses in old southern costume greeted A. C. S. ladies at Holly Springs

Left to right. **R. H. Lueck, American Can; George Norman, Hercules; R. J. Moore, Bakelite**

ARKANSAS, visible beyond the Father of Waters, was reputed to be the place one should go for amusements of a kind, but it developed that Memphis taxis are forbidden to cross the river.

* * *

EMPLOYMENT reached new highs in the Clearing House at Memphis with employers bidding actively against each other for likely candidates. Auctions were not open, as they were in slave days, but results clearly confirmed the bullish tone of the market for chemists.

* * *

TRUE to form, World War II provided sensational news just as the meeting opened. This time it was the bombing of Japanese cities and the return of Laval to power in Vichy France.

* * *

TRANSPORTATION to and from Memphis was at such a premium that even hitch-hikers suffered, their ranks swelled by those who could not get space on planes or trains.

* * *

PATRIOTISM requires chemists to join the Production Army. That was the gist of sentiment at the meeting directed at both young and old, even though the latter might have reached retirement age.

* * *

E. R. BARROW, Vice Chairman of the Local Committee, substituted for both Mayor Chandler and General Chairman Bowld in welcoming visitors at Monday's general meeting. His technique was excellent and his words to the point.

* * *

PRIORITIES, allocations, secrecy orders, and the like were fully explained at the Tuesday afternoon session of the Division of Industrial and Engineering Chemistry. Many notes were taken before the speakers admitted that all of it might be changed at any time. Difficulty in impressing Washington on chemical matters was laid to the laymen's impressions of chemists "and Washington is full of laymen".

* * *

REGISTRATION again was surprisingly high, climbing to 2324—quite a figure, considering our all-out war program and the demands upon the chemist's time.

* * *

G. E. BARTON and Albert L. Smith were easily outstanding attractions at the general meeting when they, two of ten entitled to them, received in person diplomas signifying 50 years' continuous membership in the A. C. S. Others absent from the formal presentation, but also 50-year members, were Leo H. Baekeland, Walker Bowman, Harold H. Fries, Walter Mills Saunders, Alfred Springer, C. P. Van Gundy, Homer Jay Wheeler, and Fred G. Zinsser. We bow to them all.

G. E. Barton and A. L. Smith, recipients of 50-year diplomas

PRIZES announced for award at Buffalo are: the A. C. S. Award to John Lawrence Oncley, Harvard Medical School, and the Garvan Medal to Florence Barbara Seibert, University of Pennsylvania.

* * *

COLONEL GIBSON on "The Chemist's Place in Civilian Defense" (see page 584) supplied useful guidance for those of us on the home front. His address was supplemented by the OCD motion picture on "Fighting the Fire Bomb".

* * *

LAWRENCE W. BASS, giving a preview of the report of the immense amount of work by the SOCIETY'S Committee on Economic Status, forbade quotations until checked and revised, but when the report is published be sure to read it.

It does a real job of analysis of chemical earnings.

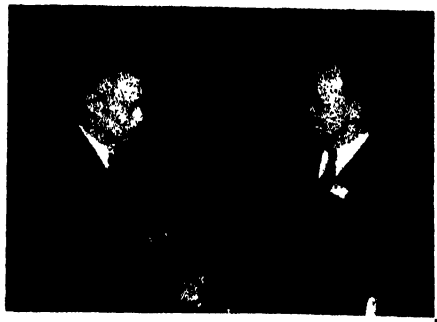
* * *

KING COTTON, everywhere Monarch of Memphis, needs research to keep his throne, according to Henry G. Knight at the general meeting. See page 581.

* * *

PRIZES awarded at Memphis were: Borden Award in the Chemistry of Milk to George E. Holm, U. S. Bureau of Dairy Industry; and Eli Lilly and Company Award in Biological Chemistry to Earl Allison Evans, Jr., University of Chicago. Each prize is a check for $1,000 and a suitable medal.

* * *



WHEN members of the SOCIETY reached Memphis they found the Hotel Peabody management had efficiently arranged that rooms would be available for them. In each room a small notice had been placed, reading: "This room reserved April 20–23, 1942. If your visit extends into the above period, please notify Asst. Mgr. On that date Memphis is host to AMERICAN CHEMICAL SOCIETY."

* * *

TWO teas were on the program for the ladies. First was the reception given in honor of wives of A. C. S. officers. The other followed a special showing of southern pottery and Van Gogh art at the Brooks Memorial Art Gallery. The Van Gogh paintings were loaned to the gallery by the Netherlands Government.

* * *

A GOVERNMENT regulation prohibiting busses from leaving the city limits threw a wrench into plans for the ladies' trip to Holly Springs, but it couldn't stop the ladies. Off they went—in private cars.

President Harry N. Holmes makes award presentations at the general meeting. *Above.* To G. E. Holm, senior chemist, Research Laboratory, Bureau of Dairy Industry, the Borden Award in the Chemistry of Milk. *Right.* To Earl A. Evans, Jr., Department of Biochemistry, University of Chicago, the Eli Lilly and Company Award in Biological Chemistry

catfish were often mentioned as a choice local dish but failed to appear because local custom labels it trout.

* * *

CENSORSHIP caught up with the meeting at several points. One was the cotton oil industry, whose doors were closed to the group because it produces linters.

* * *

"A CAPELLA" in the name of a choir means "without accompaniment". After hearing the Vanderbilt (University) A Capella Choir on Monday evening, many chemists thought the words meant "tops". Certainly the performance by the choir under the direction of Edward Cleino supported such a meaning, as does the prominence of several former choir members—Robert Perry on the Pet Milk radio program, Dinah Shore with Eddie Cantor, and James Melton on the Bell Telephone entertainment.

* * *

BEEFSTEAKS and barbecue vied with Tennessee country ham and fried chicken as leading menu demands. Fried

***Above.* R. F. Schultz of Hercules and D. Price of National Oil Products. *Below.* F. W. Sullivan Barrett, and C. L. Brown of Standard Oil of Louisiana**

LOCAL SECTION OFFICERS breakfasted early to have time for discussion of the effects of war on programs and especially on attendance in sections where distances are great. No solution of the tire shortage problem was forthcoming since even hitch-hiking seems out.

* * *

MEETING rooms were provided for most divisions to meet in comfort in the Municipal Auditorium. Ramps connected rooms on different floors and provided whispering galleries which often amplified private corridor conferences with amazing effect.

* * *

REMINISCENT of the Dallas meeting was the use of the Pepper Memorial Building of the First Methodist Church to supply three meeting rooms. Evidently Dallas experiences were considered effective with most divisions since only Sugar (which seems to need prayer especially now) and Physical and Inorganic were sent to Sunday School. Meeting rooms of Physical and Inorganic were appropriately designated X and Y, the unknown quantities.

***Above.* Lieutenant-Colonel Albert H. Hooker and Major A. Berne-Allen, Jr., of the Chemical Warfare Service. *At right.* Mrs. Ed. F. Degering and H. N. McCoy, Lindsay Light and Chemical Co.**

* * *

MEMPHIS being the home of the Blues, chemists were appropriately and delightfully entertained on Tuesday evening after the barbecue supper by an all-star colored company of singers, dancers, and instrumentalists from the famous Beale Street district. That set a high mark of real enjoyment and mirth which will be difficult to equal at future meetings.

* * *

DIFFERENT interpretation of language was evident in the signs of Memphis liquor stores. They read "Liquors and Gins".

* * *

SNUFF manufacture seemed to most chemists a small business until inspection of one large Memphis plant revealed that it alone pays some $75,000 a week in federal taxes.

* * *

CHINA RELIEF workers decked chemists with bits of bright red cloth for donations of "six cents for a Chinese child". Bids for grown-up Jap soldiers went much higher with no takers present.

* * *

MANY chemists were royally entertained in Memphis homes where they were welcomed after hotels were filled.

* * *

DIFFICULTIES of censorship, transportation, and war work were advanced unsuccessfully for omitting one meeting a year from the SOCIETY'S schedule. No definite action was taken but plans for meetings in 1944 and after were held in obeyance for future action.

* * *

MANY visitors were abashed by the free way waitresses in Memphis restaurants apply the term "Honey" to all their customers. "Honey, you must eat some vegetables" and the like.

* * *

LADIES returned to the Peabody after Tuesday's sight seeing, each bearing a cotton mop to add to their souvenirs.

Left to right: Top. E. J. Crane, *Chemical Abstracts,* Cyrus Fleck of the Mack Printing Co., and H. N. Alyea of Princeton. *Center.* G. H. Ross and E. K. Skoog, both of Solvay Process Co. *Bottom.* F. W. Sullivan of Barrett, P. M. Van Arsdell, Universal Oil Products, R. J. Moore of Bakelite, and Gustav Egloff, Universal Oil

EDWARD BARTOW, Past President of the SOCIETY, made an offer, upon seeing the murals in the Balinese Room of the Claridge, to send anyone copies of the pictures he took of the girls in Bali. Whether a copy of his famous speech "Dancing Girls I Have Known" will be included wasn't stated.

* * *

ONE of the officers of the armed forces, whose name must not be mentioned for censorous reasons, told of the Navy Admiral who while walking back to his ship one night was accosted by an enlisted man. The gob, much under the influence and for the moment not recognizing the Admiral as one, asked for a light. The Admiral flecked out his cigaret lighter, and when the enlisted man saw the gold stripes revealed by the flare, he stammered, "I am sorry, sir". The Admiral replied, "It's all right but it's lucky for you that I am an admiral and not an ensign."

* * *

IN SPITE of wartime restrictions on Weather Bureau operations, Memphis managed a consignment of the perfect product for the whole meeting, even for the Golf Tournament.

* * *

HIGH point of the entertainment especially for the ladies was the day-long tour to old homes and gardens at Holly Springs, Miss. Ante-bellum (i. e., before the War between the States) homes were opened to visiting ladies who were received by hostesses in dresses of that period and shown how the Old South lived.

* * *

WEDNESDAY evening's subscription dinner will long be remembered by the shortness of the speeches. None was longer than 5 minutes. Other sections, please note.

* * *

NO visitor was allowed by the local committee to want for anything that could be obtained. The Sheriff of Shelby County even offered space in the palatial jail, if needed. Fortunately, it was not.

SUGAR reserves received a serious blow when one Memphis Hotel ran short of teaspoons for the Chemical Education luncheon and had to use consommé spoons instead—and the sugar wasn't rationed at this particular hotel either.

* * *

THE shortage of trained chemists was borne out by one laboratory head who is hiring women technologists to conduct routine laboratory tests. "And", he said, "I'm getting the best looking girls I can find so that when the war is over they will have no trouble getting married."

Left. Hazel Jane Ward, one of the door prize winners, and A. L. Elder of the War Production Board. *Right.* Mrs. Wallingford and V. H. Wallingford of Mallinckrodt

LOCAL assistants deserved and got high praise for efficiency in helping with divisional meetings.

* * *

BOB WILSON did not win the Wilson Cup at Thursday's golfing. He did not play, was not even present.

* * *

GOLFING skill was again rewarded at the annual tournament. The Wilson Cup and a $25 defense bond went to P. M. Snyder; $25 bonds to G. A. Lenaius and L. C. Swain; $10 in defense stamps to M. J. Heiler; golf bag to A. M. Goldblatt; and an all-weather jacket to K. E. Burgess. But to J. R. Meadow for third low gross went the A-1 prize of 1942- a dozen golf balls.

* * *

A NICE gesture to the ladies at the banquet—gardenia corsages flaunting ribbons of the A. C. S. gold and blue. Door prizes were nineteen $5.00 defense stamps. Among winners were Virginia Bartow and Dr. Evans of Lilly Prize fame, both at the head table, and four Memphians—Mrs. J. Dudley Atkinson, Jr., Miss Hazel Jane Ward, G. Worthen Agee, and LeRue Marx.

* * *

AMONG spots of beauty visted by the ladies were three Memphis gardens—one, a tiny gem of perfection; another, much larger, including practically all plants adapted to the climate; the last, a huge estate, noted throughout the South, with thousands of azaleas and many wild flowers in their native setting.

Above. Isabel McKinnell of Florida State College and Chairman of the Tallahassee Section. *Below.* R. F. Nickerson of Mellon Institute

Divisional Reports

Agricultural and Food Chemistry

THE Division of Agricultural and Food Chemistry enjoyed an illuminating three-day session. Most of the 39 papers aroused considerable discussion and, in the main, the meetings were well attended.

In collaboration with the Division of Biological Chemistry, Tuesday afternoon was given over to consideration of the trace elements, manganese, bromine, boron, copper, zinc, lead, arsenic, and selenium, in plant and animal nutrition. Of special interest was the use of arsenic to offset the toxic effect of selenium among livestock grazing in seleniferous areas. The value of radioactive isotopes in the study of trace elements in nutrition was stressed by J. D. Kurbatov.

In keeping with the local of the meeting one full day was given over to papers on the utilization of the products of southern agriculture. Many speakers emphasized the important industrial and low-cost nutritive values to be derived from the by-products of cotton, peanut, and tobacco crops, all of great significance in a war-time economy.

The chemistry and industrial uses of starch attracted considerable attention in a half-day program in which the Division of Sugar Chemistry and Technology collaborated. Two groups of authors presented important contributions to the structure and mechanism of formation of starch, the isotopic tracer method being employed in the study of the latter. Astonishing results were reported from the use of levulinic acid derived from starch as a plant stimulant.

The Thursday afternoon session was high-lighted by the address of George E. Holm, 1942 recipient of the Borden Award in the Chemistry of Milk.

At the semi-annual luncheon Thursday noon special honor was paid Harry E. Barnard, chairman of the division more than 25 years ago. The occasion was commemorated by presenting Dr. Barnard with a certificate and a portfolio of letters received from his associates of many years.

R. H. LUECK, *Secretary*

Analytical and Micro Chemistry

THE meeting of the Division of Analytical and Micro Chemistry was confined to one session, at which nine papers were presented. In conjunction with the Division of Organic Chemistry, a symposium of five papers was also conducted, taking up two sessions the following day. From 60 to 100 members attended the divisional meeting and about 150 were present at the symposium. The divisional luncheon held on Thursday was attended by 36 members.

The papers by H. H. Willard on the use of ozone as an analytical oxidizing agent and of P. J. Elving on the determination of organic fluorine were especially interesting, and Father Power's paper on statistical applications provoked considerable discussion.

The symposium papers were all timely and well presented and brought to the attention of the members a great variety of new analytical tools now available in the field of organic analysis.

Dr. Royer, the Chairman, announced tentative plans for a symposium with the Division of Analytical Chemistry at the Buffalo meeting on the general topic of teaching analytical chemistry, with special reference to the needs of the industries. He also reported on the progress of the various committees of the division and announced that the first two primary standards for elementary organic analysis namely, benzoic acid and acetanilide—were ready for distribution by the National Bureau of Standards. The other proposed standards are in process either of purification or of testing.

FRANCIS W. POWER, S.J., *Secretary*

Biological Chemistry

ON TUESDAY, joint meetings were held with the Division of Agricultural and Food Chemistry on Vitamins and on Trace Elements in Nutrition. The first brought out much information on the determination, instabilities, and the interaction of vitamins. A possible new factor in liver extract affecting the nutrition of rats was reported. Anhydrovitamin A and kitol were added to the complications (and clarifications) of the chemistry of A vitamins. Although there was a considerable turnover, attendance was consistently between 150 and 180.

Wednesday 16 papers were given covering a wide range of topics. Perhaps the most novel was an attempt to estimate the presence, and perhaps the severity, of disease, from polarographic data and measurements of surface-film areas on certain blood-protein fractions. Attendance was fair at 60 to 120, except that the room overflowed for the excellent address of Earl A. Evans, Jr., when he described the work on which the Eli Lilly Award was based.

BEN H. NICOLET, *Chairman*

Cellulose Chemistry

THE Division of Cellulose Chemistry held two sessions on Thursday. While the number of papers was less than at

Spring arrived before the chemists

some previous meetings, the attendance was above normal. Interesting discussions followed each of the papers, all of which were of high quality, showing careful preparation. A group luncheon, characterized by its friendly and informal discussions of problems of interest to individual groups, was held at the Gayoso Hotel. Interest in chemical developments which are expected from a better knowledge of the fundamental aspects of cellulose chemistry was especially evident.

The committee wishes to express its appreciation to the local group for the splendid way in which every requirement for a successful meeting was provided and to all the chemists of the Memphis area for their friendly cooperation and hospitality.

ELWIN E. HARRIS, *Chairman*

Colloid Chemistry

THE spring meeting of the Division of Colloid Chemistry was attended by a total of about 160. There were only a few papers since most colloid papers are held over for the Colloid Symposium in June. Each paper presented an application or development of physical chemistry in the field of colloids.

One paper from Stanford University showed that the phase rule in its classical form is strictly applicable to certain types of colloid systems. An extraordinary variety of interesting and characteristic new phases occur in soap systems. The phase diagrams seemed to yield a definitive interpretation of processes of soap manufacture.

A paper from the Rice Institute again used the physical tool of x-rays to characterize and interpret the crystalline nature of the constituents of gelatinous precipitates such as copper sulfides.

A continuation of the studies from the Univerisity of Missouri on the permeability of clay membranes to cations showed that the electrochemical potentials so produced promised to be a most useful tool for measuring ionic concentrations in dilute solutions.

Another paper from Stanford University presented a new measure of stability of foaminess and analyzed the breakdown of froth into processes of drainage (corresponding to "creaming" in emulsions), collapse or coalescence, and additional stabilization in the residual surfaces by accumulation of stabilizing material thereon.

J. W. MCBAIN
Secretary-Treasurer

Chemical Education

THIRTY-THREE papers were presented during the division's four sessions. Sixteen were given by students on Wednesday, both sessions being devoted to the Student Program. In the main, these student papers were good, carefully prepared, and well presented.

More than 100 attended the Student Breakfast preceding the Student Program.

The Round Table on the Problem of Teaching Chemistry attracted a large audience which apparently felt repaid for sitting three hours through the presentation of thoughtfully prepared papers and the helpful discussion which followed.

The Book Exhibit, sponsored by the division, proved to be a welcome innovation to the more than 1,200 who visited it in the Hotel Peabody.

PAUL H. FALL, *Secretary*

Gas and Fuel Chemistry

THE meeting of the Division of Gas and Fuel Chemistry was held Wednesday afternoon. The attendance was fairly regular—about 30 to 40. Papers of timely interest dealing with coal hydrogenation, combustion in the Diesel engine, and coal problems, including dustproofing, rapid moisture determination, and oxidation were well received and brought forth interested discussion.

G. R. YOHE, *Secretary*

History of Chemistry

THE Symposium on the History of Chemistry in the South was given exactly as planned with every author present and presenting his own paper. The attendance was much above average and it was interesting to note how many came to hear the report on their own state. It is hoped that the reports from the three or four states not represented may be given later.

All the papers scheduled for Wednesday morning were presented with the exception of No. 12 by V. F. Payne. Appreciation was voted of the carefully prepared and comprehensive report of C. A. Browne

At the symposium of the Division of Industrial and Engineering Chemistry. *Left.* A. W. Fisher, Jr., Fisher Scientific Co. *Center.* H. E. Barnard, WPB. *Right.* A. L. Elder, WPB

and Eva V. Armstrong on the plan for preparing under the sponsorship of the division a History of Chemistry in America.

Dr. Browne's paper and slides on Bernard Tollens and some American students in his school were especially enjoyed as also was Miss Wall's discussion of the life of Hofmann.

Plans were made for a bicentennial celebration, in the spring of 1943, of the birth of Lavoisier and of Thomas Jefferson.

HARRISON HALE, *Chairman*

Industrial and Engineering Chemistry

ATTENDANCE at the general sessions was consistent and averaged about 150 persons. Several of the papers occasioned more than usual discussion but particularly Dr. Nickerson's paper on "Structure, Properties, and Industrial Utilization of Cotton". Dr. Othmer's four papers on vapor pressure and related subjects almost constituted a symposium and were extremely ably presented.

The Symposium on Effect of Priorities on Research Laboratory Administration was attended by an almost capacity crowd of over 300 people in the main ballroom of the Peabody Hotel. A. L. Elder's clear exposition of the reasons for secrecy and the withholding of chemical patents during the war period brought out points that had puzzled many research workers. H. E. Barnard very ably discussed the application of priorities to the needs of chemical laboratories and suggested the best ways whereby priorities may be obtained on equipment essential to the war effort. The difficulties that Dr. Barnard's group has experienced in keeping the channels open for high priorities to research laboratories were outlined, and the ways in which he has been able to inform those in high places of the need for fundamental laboratory investigations were particularly illuminating. Following this paper, Aiken W. Fisher, Jr., Fisher Scientific Co., presented the suppliers' viewpoint. Emil Ott, of the Hercules Powder Co., outlined the problems of the industrial research laboratory, and H. F. Johnstone of the University of Illinois presented the viewpoint of the university laboratory. A heated discussion followed these papers and was most ably crystallized by D. B. Keyes' strong plea for direct allocation of the supplies necessary for research work. This symposium was without a doubt one of the highlights of the meeting, and it is regretted that because of necessary war secrecy the information given by the authorities who spoke cannot be distributed more widely.

More people wished to attend the division's luncheon than could be accommodated. Those who were fortunate enough to attend heard a stirring address by W. H. Jasspon, president of Perkins Oil Co. and vice president of the Cotton Research Foundation. He outlined the benefits that a group of cotton growers can obtain by virtue of association with organized research.

WHITNEY WEINRICH,
Secretary-Treasurer

At the Division of Industrial and Engineering Chemistry luncheon, Tuesday, April 21. *Left to right:* R. Norris Shreve, W. H. Jasspon, speaker, L. W. Bass, Whitney Weinrich, and H. F. Johnstone

Medicinal Chemistry

THE Division of Medicinal Chemistry held one half-day session at which eight papers on the synthesis and properties of organic compounds of medicinal interest were presented. As usual, new sulfa compounds attracted considerable interest. The meeting was well attended and was followed by the divisional luncheon at which 56 persons were present.

JOHN H. GARDNER, *Chairman*

Organic Chemistry

MEMBERS and guests of the Division of Organic Chemistry who persevered and followed Room L signs up three flights of stairs and along two ramps were rewarded with a stimulating meeting at Memphis. A few chemists, not yet reduced to slender proportions by wartime restrictions, were heard to complain slightly about the location of their meeting rooms. The division is indebted to Jacob R. Meadow, Southwestern College, Memphis, Tenn., and his assistants, who handled the speakers' slides and local arrangements very capably.

Papers presented before the division drew large audiences. Synthetic, theoretical, heterocyclic, carbohydrate, aliphatic, aromatic, sterol, vitamin, and bile acid fields were represented by papers. A joint symposium with the Division of Analytical and Micro Chemistry was held on Thursday on Analytical Methods in Organic Chemistry. The division is indebted to Frederick D. Rossini, Ernest H. Huntress, Walter M. Lauer, Wallace R. Brode, and Robert C. Gore for their kindness in addressing members of the symposium and to the many authors who contributed papers to the regular divisional meeting.

The Executive Committee of the division undertook preliminary consideration of possible locations for the next National Organic Chemistry Symposium, to be held in December 1943. Suggestions are invited from members of the division. Several chemists have expressed the hope that the next symposium be held at a place where facilities match those enjoyed at the recent Ann Arbor symposium.

ARTHUR C. COPE, *Secretary*

Paint, Varnish, and Plastics Chemistry

THE number of members and guests in attendance at the presentation of the paint and plastic papers varied from about 75 to 350. These figures are somewhat lower than at past meetings, owing primarily to two factors—the demands made upon many of our members by the war effort and the difficulties encountered and time consumed in reaching Memphis.

Some of the papers attracted considerable attention. Paint and lacquer formulators were particularly interested in the possibilities offered by the nitroparaffins described by Bogin and Wampner. Fischer and Jerome presented extensive data demonstrating that the influence exerted by surface-active agents on the properties of pigment suspensions varies greatly with the nature of the pigment and vehicle so that any given agent may not only aid in deflocculation but may also cause flocculation. A simple bubble viscometer permitting the determination of the viscosity of highly viscous oils and resin solutions, designed by Young and McArdle, promises to become an important and useful tool in the study and control of the properties of paint liquids. The papers dealing with the study of high polymers by infrared absorption spectroscopy, solvent fractionation, viscosity and cryoscopic methods gave rise to considerable discussion on the merits and demerits of the various experimental and theoretical approaches.

On Tuesday evening the members and guests of this division sought and found relaxation in a good dinner and snappy show. Chairman S. L. Bass, in welcoming the guests, proved to be a very capable toastmaster and his ready wit and large selection of funny stories put all present in a receptive mood for the entertainment that followed.

A. C. ELM, *Secretary*

Petroleum Chemistry

THROUGHOUT a considerable part of the program, the seating capacity of the meeting room (220) was filled to overflowing. On the basis of attendance, chief interest was evidenced in those papers dealing more or less broadly with the major petroleum problems of the day; nevertheless the variation in the personnel of the audience with successive papers strongly indicated the specific interests of those present.

LOUIS HENDERSON, *Acting Secretary*

Physical and Inorganic Chemistry

THE division met for its usual dinner at the Gayoso Hotel on Monday evening. About 65 members and friends were present, and were entertained after the meal by Paul M. Gross, who gave an extremely interesting account of some of the research on tobacco being carried out at Duke University.

The division held a Symposium on the Hydrogen Bond and Related Topics on Tuesday and a Symposium on the Rare Earths on Thursday. The papers were well received and brought forth considerable discussion. The members interested in the rare earths met for a special breakfast Thursday morning.

Several sessions of contributed papers were held Wednesday.

In spite of the preoccupation of many of the members with defense work, and consequent small number of contributed papers, there was a fairly representative attendance, and the meeting was successful.

O. K. RICE, *Secretary*

Sugar Chemistry and Technology

THE first three papers on the program of the division were of much greater interest than was expected by those who were previously informed on the chemical possibilities for carbohydrates. Papers

Southern hospitality and service with smiles

The smile that sold all the abstracts

that followed amply justified the stated opportunities offered by the possibility of limitless production from soil, rain, and sunshine of very pure carbohydrate from which may be produced truly an infinite number of products. Many such products were enumerated and some of the characteristics were described. The production of alcohol, ancient though it may be, is today shown to be capable of radical improvement through the use of molds for conversion of starch to fermentable sugars. Such improvement may be followed by continuous fermentation resulting in remarkable speed and efficiency as compared with present standard practice.

Among the many interesting papers was the description of the development of an equipment to determine continuously, and thereby control, the degree of supersaturation in a solution from which crystallization is taking place. This can be of great commercial importance.

Progress is continually being made toward clearing up the mystery of purification accomplished by bone char and similar carbons and this clarification of structure, physical and chemical, is being pursued very actively to ascertain the character of the starch molecule. Many are interested in this effort and much information was presented which indicates the problem is well on the way to solution.

E. WHITMAN RICE, *Secretary*

Water, Sewage, and Sanitation Chemistry

EIGHTEEN papers were presented at the two sessions of the division held on April 21. The subject matter covered water analysis, water treatment, public water supplies, and industrial waste treatment.

The water analysis papers included analyses by absorption spectra, x-ray diffraction methods, photometric and the usual volumetric procedures. The papers on filter photometry and a new method for determining calcium by soap solution caused considerable discussion. The role of carbon dioxide in the shattering and cracking of ice also aroused much interest.

Public water supplies of Arkansas, Florida, and Oklahoma were discussed in three papers, Florida supplies calling forth most discussion.

Two papers on trade wastes were given—one on laundry and the other on cannery wastes. Several asked for more information on the construction of the plant for treating laundry wastes.

The morning session was unusually well attended.

H. GLADYS SWOPE, *Secretary*

Women Chemists at Convention 103 in Memphis

May Whitsitt, Southern Methodist University; Florence Wall, New York consultant

THE keynote of the women chemists group at Memphis was that the women are ready, waiting, and anxious to do their part in the present emergency. Women are now going to have the chance they have been waiting for and it is up to them to prove their value and to contribute their share to chemistry as a profession.

Iota Sigma Pi held its convention meeting at breakfast on Tuesday. Kathryn H. Hicks was the chairman and Evelyn McBain, national president of the sorority, the principal speaker. Dr. McBain gave a review of the present status of the opportunities for women in chemistry. Mrs. Hicks followed with a summary of the position held by women chemists in the southern area

Mrs. Hicks and her committee also proved themselves excellent hostesses for the women chemists group of about 75, and the mementos—a bottle of gardenia perfume and souvenir cotton bolls from Memphis—were pleasant reminders of the luncheon on Tuesday. Miss Wall, the principal speaker for the occasion, in her own unsurpassed way, told her experiences as a pioneer in the profession of chemistry for women. Her talk was an inspiration and was thoroughly appreciated, as one woman to another.

As a conclusion to the women chemists luncheon, a survey on the employment of women in chemistry under the chairmanship of Dr. Whitsitt was reported by Mildred Graflin. Miss Graflin's report included a short review of the compilation of the statistics on employment of women as given by the WPA group; her conclusion was that this survey was the most complete reference material at hand concerning the employment of women in the chemical and allied professions. Plans for keeping the report by the WPA up to date were also discussed since the business and professional women are expecting to complete yearly surveys in order that the report may be continuous and a fair cross-section dealing with women's employment.

The climax of the convention for the women chemists occurred with the speech at the subscription dinner Wednesday evening when Dr. Whitsitt gave an excellent summation of the challenge the present crisis presents and its acceptance by the women in chemical professions. The gist of her talk was that "the opportunity has presented itself and we are glad to be here and ready at a time when we are most needed".

A. C. S. Committee Reports

Advisory to the Bureau of Mines and the Bureau of Standards on Nonferrous Metals

OWING to the present emergency, there were no meetings held during 1941 of these committees, nor do I believe there will be any held during the war.

WM. B. PRICE, *Representative*

Analytical Reagents

DURING the year the committee continued the preparation of specifications for analytical reagents and the consideration of corrections to published specifications. The committee continued its cooperation with the Subcommittee on Reagents of the Committee of Revision of the U. S. Pharmacopoeia in the preparation of specifications for reagents for the current revision.

W. D. COLLINS, *Chairman*

Outside the old slave quarters at Walter Place, Holly Springs, where the A. C. S. ladies saw the Old South

Cooperation with the Chemical Warfare Service

THE committee has not met as a group since our last report. There have been frequent contacts between officers and technical personnel of the Chemical Warfare Service and individual members of the committee in regard to problems that arise from time to time. Naturally the nature of this work is such that no detailed report can be made.

H. E. HOWE, *Chairman*

Economic Status

THE committee was appointed in September 1941.

A comprehensive survey of the economic status of members of the SOCIETY was selected as the first major project. With the aid of Dr. Parsons, the interest of the U. S. Bureau of Labor Statistics was enlisted, and a cooperative arrangement with that bureau was worked out. A completely precoded questionnaire was developed covering annual incomes and monthly earnings of the membership for nine selected years during the period 1926–41 in relation to educational level, years of professional experience, geographical location, size of community, occupational status, source of employment, and field of specialization.

Questionnaires were mailed on November 25, 1941, to the 24,490 members of the SOCIETY located in the United States and its possessions. The questionnaire was

closed on January 25, 1941, by which date 19,008 returns had been received, representing 77.6 per cent of the number mailed. The data from the questionnaires were transferred to punch cards by the Bureau of Labor Statistics. Early in February the machine tabulations were begun by the bureau. The data from the machine tabulations were analyzed by a clerical staff engaged by the committee. A comprehensive report on the results of the survey was presented on the general program at the Memphis meeting of the SOCIETY. The manuscript will be ready for publication shortly. The committee contemplates supplementary studies as warranted by the findings of the present survey.

L. W. BASS, *Chairman*

Exchange

WARTIME irregularities have had a strong effect on the work of the committee during the past year. Exchanges actively in effect now total 351 as contrasted with 490 last year and 663 in 1940. Efforts to maintain the foreign exchanges in spite of warfare were fairly successful up to the time of the happenings in last December. Now communication with most of the countries of Europe and Asia is blocked and the exchanges are at a low ebb.

The committee has made 14 new exchange arrangements since its last report (made March 21, 1941). During this period 167 exchanges have been discontinued; 45 were Japanese, 31 were German, 11 Rumanian, 10 Fininsh, 8 Ukrainian, 4 Latvian, 2 Estonian, 2 Hungarian, 2 Philippine, 2 Yugoslavian, and 1 each Austrian, Belgian, Bulgarian, Chinese, Manchurian, and Norwegian. The discontinued German exchanges and a few of the others had been reinstated after temporary discontinuance during the earlier days of the war in Europe. Seven old exchanges have been resumed during the past year. Fourteen exchange proposals by others have been refused and all exchange requests which we have made have been granted.

The office of *Industrial and Engineering Chemistry* receives 16 of the exchange periodicals and the remainder come to the office of *Chemical Abstracts*. Though its effectiveness is much curtailed now, the exchange plan is of great service in obtaining papers for abstracting. (The committee Chairman asks the privilege of stating parenthetically, as Editor of *Chemical Abstracts*, that diligent effort to obtain by other means papers needed for abstracting from the countries affected by the war has met with some, though decreasing, success during the past year. Difficulties have increased, but the effort is being continued.)

It is the policy of the committee to reconsider all of the existing exchanges twice each year to see that they are in good order and to determine whether or not continuance is justified. Besides this systematic check special attention has been paid to war developments and their effect on journal deliveries in both directions.

E. J. CRANE, *Chairman*

Hazardous Chemicals and Explosives

THE committee reports that it has been active in its capacity as consultant to a similar Committee on Hazardous Chemicals and Explosives of the National Fire Protection Association during the past year.

The committee has answered the usual inquiries submitted by various officers and members of the SOCIETY and other individuals interested in hazardous chemicals and explosives.

In cooperation with the committee of the National Fire Protection Association, authoritative data have been prepared on additional hazardous chemicals and revisions have been made on many of the chemicals listed in the 1939 edition of the Table of Common Hazardous Chemicals.

Because of the numerous manufacturing plants now using hazardous chemicals in connection with the war effort and the many new chemicals having toxic and combustible properties being developed and used in large quantities in the chemical industries in connection with national defense, the functions of our committee are becoming of increasing importance. These newer chemicals are critically reviewed with respect to their life, fire, and storage hazards. Recommendations are made relative to proper fire-fighting methods when the hazardous chemicals are involved in fires.

G. W. JONES, *Chairman*

Industrial Alcohol

THE committee has held no meetings and has not been active during the past year. No major industrial alcohol problem has been presented to the committee, and none such has arisen.

MARTIN H. ITTNER, *Chairman*

Licensing Inquiry

THE committee reports that the only important item under observation during the year was a new bill that was introduced into the New York State Legislature somewhat modified in comparison with previous attempts and purporting to be permissive in character only. This bill was killed in committee. It is not yet certain whether or not it will be reintroduced during the present year.

The committee is watching trends in legislation and is of the opinion that the state legislatures generally are not likely to give much attention to matters of this kind during the present emergency.

F. W. WILLARD, *Chairman*

Membership

THE committee is pleased to report that the membership again increased in 1941. A detailed statement follows:

Individual members elected 1941...	4,428
Corporation members elected 1941..	38
Members resigned during 1941.....	410
Deceased members 1941.....	79
Total membership at end of year 1941.....	28,738
Members dropped for delinquency on December 31, 1941.....	782

W. D. COLLINS, *Chairman*

Nomenclature, Spelling, and Pronunciation

INTEREST in America in the use of good chemical nomenclature is growing. The committee sees much evidence of this growth. Inquiries concerning good usage received by the committee are numerous. There is gratifyingly strong demand for copies of printed nomenclature rules. Cooperation is easier to obtain. It is encouraging to observe a fuller realization that exactness should characterize the reporting of scientific results as well as the obtaining of them.

During the past year the committee has distributed, at 10 cents per copy, 755 reprints of Rules for Naming Inorganic Compounds, which is the latest report (1940) of the Committee for the Reform of Inorganic Chemical Nomenclature of the International Union of Chemistry. The committee has provided an American version of these rules by a limited amount of editing of spellings and of the translation, done with the understanding that it was not the intent of the International Committee to interfere with the written forms peculiar to the languages of individual countries. Demand for the rules for naming organic compounds (Definitive Report of the Commission on the Reform of the Nomenclature of Organic Chemistry of the International Union of Chemistry, issued in 1933) has also been strong, so that the committee has had to provide itself with a supply of an additional 2,000 copies. Sales of the organic rules, also at 10 cents per copy, total 2,836 to date. There is a steady demand for the committee's other nomenclature and pronunciation pamphlets also.

Leonard T. Capell and Austin M. Patterson have been the most active members of the committee in answering the numerous nomenclature questions which come from individual investigators, editors, and representatives of other organizations. The committee, with the cooperation of the *Chemical Abstracts* office staff, endeavors to maintain a clearinghouse for information on good nomenclature usage,

and our most active year in this work has just been completed.

E. J. CRANE, *Chairman*

Paper

THE practice of checking each delivery of paper made to the printer to determine whether or not it conforms to the specifications has been followed, as in past years. No serious deficiencies were found in any delivery, and in no case did the deficiency affect either permanence or printing quality.

The committee, with the cooperation of the paper mills and the printer, made a study of some of the papers in an effort either to improve the quality of the printing or to obtain a satisfactory paper of a lower grade than formerly used. As a result of this work, the committee has approved the following changes in specifications:

A. General Requirements. Owing to the War Production Board's restrictions on the use of chlorine and other chemicals, it may be necessary to relax somewhat our requirements that the stock used in certain papers be free from unbleached or groundwood fibers. Thus far all papers have complied with the specifications, but future restrictions may make it necessary that we permit the use of some unbleached stock. It is not probable that the use of groundwood will have to be considered.

Rather than alter the specifications to permit definite changes in stock requirements, the committee is of the opinion that a new item, A-3, under general requirements will allow ample leeway to permit only such deviations from the specifications as may later prove necessary. Furthermore, when restrictions are removed after the war, it will be a simple matter to drop this one item, thereby restoring the original requirements.

The new item A-3 is to read, "Stock requirements shall be subject to such modifications as may be required by the orders of the War Production Board. All modifications must have the approval of the Paper Committee."

Supercalendered Book Paper. Item B-1-f. Oil penetration to be 125 to 150 sec., instead of 75 to 100 sec. With the equipment available for preventing offset, this change aids in getting more brilliant and sharper printing. The effect has been particularly noticeable in recent issues of CHEMICAL AND ENGINEERING NEWS, where there has been a definite improvement in the printing of the halftones.

Coated Cover Papers. Items B-3 and B-4. This was changed last year from a No. 1 to a No. 3 grade. The smoothness specifications, Items B-3-e and B-4-f, have been lowered slightly. The new specification requires a minimum smoothness of 500 sec. as compared with the old requirement of a range of 600 to 800 sec. The No. 3 grade is proving satisfactory in use and the quality of the printing is good.

Envelope Paper. Item B-7-a. Eliminate "unbleached." **Item B-7-g.** New item. **Minimum pH value 5.0.** This change was made unofficially some months ago and is in line with the findings and experience of the Government Printing Office and the U. S. Bureau of Standards.

Section C. Methods of Testing. The method of making the Dennison wax test is clarified by specifying a 15-minute cooling period for the wax after application to the paper.

As in past years, the committee has maintained close contact with the Mack Printing Co. and the mill which supplies the paper used in printing the body portion of the SOCIETY publications. The Chairman of the committee made two trips to the printing plant and Mr. Fleck, vice president of the Mack Printing Co., met with one of the committee members at the Bureau of Standards to discuss the above changes.

Following our established custom, the committee held a luncheon meeting at the annual T. A. P. P. I. convention, at which both the printer and paper mill were represented. We have found this annual get-together to be of considerable value to all concerned.

B. L. WEHMHOFF, *Chairman*

Patent and Related Legislation

THE committee has been unusually active this year, but has carried on its work entirely by correspondence between the members, the Chairman, and H. T. Stowell in Washington. Mr. Stowell, member of the committee, has furnished much valuable assistance in keeping the members advised of pending legislation and hearings thereon before congressional committees and in appearing personally at some of these hearings.

The procedure followed has been generally the same as last year. With respect to all important proposed patent legislation, the views of the committee members were obtained either by questionnaires or by exchange of letters, and reports of the opinions so expressed were distributed to all the committee members. Also, whenever it appeared advisable, the recommendations and views of our committee were communicated to the Chairman of the appropriate Congressional Committee, either by letter, telegram, or by personal appearance at hearings.

It is gratifying to report that none of the proposed legislation which was considered by the committee to be dangerous or ill-advised has been enacted into law.

New Laws

The important legislative measures relating to or affecting patents, enacted into law during 1941, may be summarized briefly as follows:

Public Law No. 221, approved August 18, 1941. This act revises Section 4989 of the Revised Statutes. It authorizes the assignment of applications for patent and provides for recording such assignments on the same basis as assignments of patents.

Public Law No. 239, approved August 21, 1941. This act amends Public Law No. 700 of the 76th Congress, under which the Commissioner of Patents is authorized to issue secrecy orders. The act prohibits the filing in any foreign country of an application for patent on any invention made in the United States without license from the Commissioner of Patents and provides for fine or imprisonment for violation of a secrecy order or for filing a foreign application without a license.

Public Law No. 274, approved October 16, 1941. This act provides for the requisitioning of "military or naval equipment, supplies, or munitions, or component parts thereof, or machinery, tools, or materials necessary for the manufacture, servicing or operation of such equipment, supplies, or munitions" which are needed for the defense of the United States. The bill further provides for the primary determination of fair and just compensation for the property by the President subject to review in the Federal Courts.

The original bill, S. 1579, specifically provided for the taking of patents and patent rights, but this provision was eliminated from the bill by the Senate Military Affairs Committee before the bill was reported.

Public Law No. 354, approved December 18, 1941. Title I. Authorizes the President to coordinate, consolidate, and transfer duties and powers of any executive department, commission, bureau, agency, governmental corporation, office or officer, except the General Accounting Office.

Title II. Authorizes the President to authorize entering into any contract for war purposes without regard to legal restrictions, but prohibits "cost-plus" contracts.

Title III. Amends the Trading with the Enemy Act of October 6, 1917, to give the President complete control over transactions involving any property or right in which any foreign government or national has any interest, including the power to take over any such property or interest; and grants full power of censorship over all communications between the United States and foreign countries.

Pending Legislation

In addition, some 15 or 20 new bills were introduced in Congress, and are still pending, which relate to various aspects of patents and patent rights. Some of the more important of these pending bills are the following:

S. 674, S. 675, and **S. 918** (all introduced by Senator Hatch) are the administrative procedure bills. **S. 675,** proposed by the majority of the members of the Attorney General's Committee, specifically excludes patents and trade-marks from most of its provisions. Extensive hearings before a subcommittee of the Senate Judiciary Committee have been concluded. A favorable report on a bill in the form of **S. 675** is anticipated.

H. R. 3360 (Kramer) would prohibit issuance and enforcement of injunctions on patents when necessary in the national defense. Substitute proposals which would grant authority to the President to requisition patents or any interest therein were submitted by the Department of Justice. Extensive hearings on the bill and the Justice Department proposals were held by the House Committee on Patents. No action has been taken on this bill since the hearings terminated in April 1941. It may be assumed that the House Committee was convinced that the proposed legislation is not necessary. But a new bill, namely

S. 2303 (O'Mahoney) has recently been introduced in the Senate. This new bill would provide for granting of licenses by the President under any patent with respect to any material or article which he

might find and declare to be in the interest of national defense, during any war in which this country is engaged, and would prohibit injunctions with respect to any such material or article during the period specified by the President, and limit recovery by the patent owner to a reasonable royalty fee. Section 2 of this bill would go still further and authorize the President, during any period of national emergency declared by him and whenever he determines it to be in the interest of national defense, to acquire patents and inventions by various means, including a declaration of taking, the only recourse of the patent owner in that event being to bring suit in the Court of Claims for compensation. This new bill has not yet been set for hearing, but a hearing thereon before the Senate Committee on Patents is expected shortly, and the matter is receiving careful consideration by our committee.

S. 892 (Bone) and H. R. 3211 (Kramer) limiting the life of a patent to twenty years from the application, and S. 928 (Bone) establishing a circuit court of appeals for patents, appear to be the most controversial items of the legislative program proposed by the Commissioner of Patents more than two years ago. It does not appear that any action has been taken on these bills in either house of Congress or in either of the Congressional Patent Committees during the present session, although the other items of the Commissioner's program were enacted, as reported in our committee report of March 1940.

Court Decisions

The committee has also followed certain trends which have become apparent in recent litigation involving patents and also involving alleged unlawful monopolistic practices by patent owners and by those operating under patents. These trends include a notable raising of the standard of invention required to support validity of patents, resulting in a marked increase in the proportionate number of patents held invalid because of failure to meet this standard; and a restriction of the scope of the monopoly afforded by a patent, both with respect to the exercise of control over the prices or distribution of goods not directly covered by the patent but resulting indirectly therefrom, and also with respect to contributory infringement by others who furnish material or equipment that does not directly infringe but which is to be used in operations that do infringe.

A further outgrowth of this last-mentioned trend is apparent in a number of recent Supreme Court decisions to the effect that where a patentee has attempted unlawfully to extend his patent monopoly so as to control the sale of unpatented articles, it is contrary to public policy to grant the patentee any relief in court, under the patent, even against others who directly infringe, until such improper practice is completely abandoned and the consequences thereof "have been fully dissipated".

There have been numerous suits recently under the anti-trust laws, based on alleged improper uses of patents for the control of prices and stifling of competition. The above noted trends, and the effects of some of these recent decisions, have been reported more fully in an article by Nelson Littell, member of our committee, in the January 1942 issue of *Industrial and Engineering Chemistry*.

Nonlawyer Patent Attorneys

Finally, we report that our committee has given much time and thought to the agitation which presumably started with members of the bar to prohibit practice before the Patent Office by nonlawyer patent attorneys. This agitation has been particularly pronounced in the states of Illinois and California, and several bills were introduced in Congress which, if they had been enacted, would have prohibited the continued practice of nonlawyer patent attorneys before the Patent Office. State measures such as have been proposed in Illinois and California would not be binding upon the Patent Office, but would regulate the activities of patent attorneys within the state. More recently similar agitation has been started in the State of Pennsylvania. Our committee is of the opinion that many chemists who are not members of the bar are doing valuable and constructive patent work, and we are pleased to report that no adverse legislation has yet been passed.

Patent Planning Commission

President Roosevelt has appointed a Patent Planning Commission to study the problem of stimulating invention and also to study the question of constructive improvements in the patent statutes. Membership of this commission is as follows: Charles F. Kettering, representing science; Owen D. Young, representing industry; Chester C. Davis, representing government; Edward S. McGrady, representing labor; and Francis P. Gaines, president of Washington and Lee University, representing the public.

WALTER A. SCHMIDT, *Chairman*

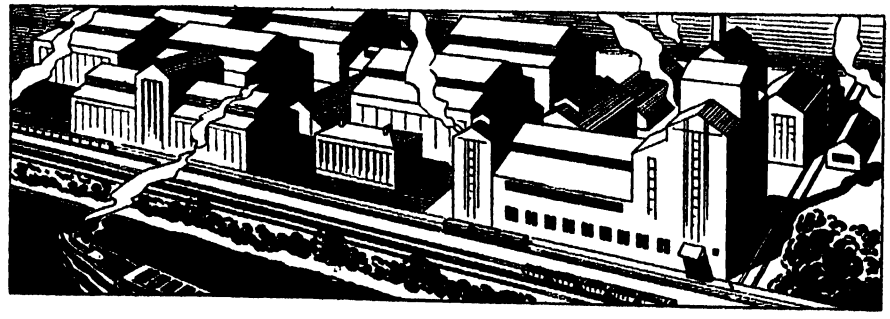
Professional Status

THIS committee has found nothing to do for the past two years. No suggestions have been made to it by members or members of the Council, and the committee itself has been quite inactive.

There has recently been appointed a committee for the study of the economic status of the chemist. It is believed that this committee will perform most of the functions which the membership expected the Committee on Professional Status to execute.

In view of this situation it is respectfully requested that the Committee for Professional Status be disbanded.

THOMAS MIDGLEY, JR., *Chairman*



Professional Training of Chemists

SINCE the St. Louis meeting, the committee has continued its program of visitation. Many institutions were considered at the time of the Atlantic City meeting, and a revised list of institutions was published in the October 25, 1941, NEWS EDITION. That list contained the names of 111 institutions whose graduates, when certified by the chairmen of the departments concerned, are eligible for membership in the AMERICAN CHEMICAL SOCIETY in the minimum length of time following graduation as specified in the bylaws. The statistical data presented on page 599 will indicate the number of institutions which have been considered together with the number which have not been approved and the number on which action has been deferred.

The committee has also begun a review of those institutions which have been approved on previous lists. In some instances important changes in personnel or other factors have made it necessary to withdraw approval.

The present situation arising from the war has changed materially curricula in a large number of institutions. Many colleges and universities are now forced to operate with reduced personnel and generally speaking, the situation has become abnormal for most institutions of higher learning. The committee must consider very carefully, therefore, just what is to be the nature of its activities during the present crisis. It is planned to complete considerations of all those institutions which have signified their willingness to cooperate with the committee but, aside from keeping data up to date, it may be necessary to restrict consideration of institutions hereafter to those cases in which marked changes not to be ascribed primarily to "speed-up programs" have considerably lowered the level of instruction and quality of staff.

The most important problem confront-

ing the committee lies in the evaluation of the quality of the teaching staff. No objective standard has yet been formulated to meet this problem, but a letter was addressed to the chairmen of chemistry departments asking for suggestions on this matter. About 93 replies have been received.

The following statistical data summarize the activities of the committee from April 1, 1941, to April 1, 1942:

Institutions Participating in the Program	Apr. 1, 1941	Apr. 1, 1942
Number authorizing visits	407	436
Number deferring authorization	21	7
Number of visits unnecessary	18	38
Number approved without visits	13	13
Number yet to be contacted	23	0
Number of replies not yet received	8	0
Number whose status is indefinite	...	6
Total institutions participating	490	500
Visitation Program		
Number authorizing visits	407	436
Number visited	323	423
Visited previous to Sept. 1, 1941 (Atlantic City meeting)	390	
Visited since Sept. 1, 1941	33	
Status of Institutions Considered to Date		
Approved	92	111
Rejected	141	235
Deferred	76	41
No action pending further study	...	3
Total considered	309	390

Institutions Considered by the Committee at Its Meetings	
Number considered previous to Apr. 1, 1941	211
Number considered at St. Louis, Apr. 5 to 8, 1941	227
Number considered at Atlantic City, Sept. 1941	132
	570

Total Institutions Considered by the Committee (These figures exclude review of institutions and show only total number considered at least once by the committee)		
Prior to Apr. 1, 1941	211	
St. Louis, Apr. 5 to 8, 1941	108	
Atlantic City, Sept. 4 to 8, 1941	71	
Memphis, Apr. 20 to 23, 1942	33	
	423	
Total remaining to be considered	13	
Total authorizing visits	436	
New colleges and universities considered through Atlantic City		390
Schools that have been considered more than once through Atlantic City		180
		570

Questionnaires

In June a questionnaire was sent to each approved department of chemistry and chemical engineering in order that the department chairman might indicate to the committee the list of students who had fulfilled the Society's minimum requirements and thereby were eligible to be admitted to full membership in the Society in the minimum length of time.

From this same questionnaire was secured information relative to staff changes, staff activities, changes in equipment and facilities, and other information of value to the committee so that it could be familiar with the present status of chemistry instruction in each of the approved schools.

Again this year, a questionnaire will be sent out, less extensive in form, but which will secure similar information.

National Roster of Scientific and Specialized Personnel

The committee's secretary has handled the registration of senior student chemists and chemical engineers and graduate students in both of these fields for the National Roster of Scientific and Specialized Personnel.

The following students have been registered throughout the United States:

	Chemists	Chemical Engineers
B.S.	4,591	1,985
M.S.	718	233
Ph.D	519	59
Total	8,105	

W. A. Noyes, Jr., *Chairman*

Soap and Soap Products

During the past year the committee submitted to the Supervisory Committee on Standard Methods of Analysis a recommended revision of the Standard Method for the Sampling and Analysis of Commercial Soaps and Soap Products, Revised [*Ind. Eng. Chem., Anal. Ed.*, 9, 2 (1937)], and it has been approved by the Supervisory Committee on Standard Methods of Analysis.

F. W. Smither, *Chairman*

Standard Apparatus

The committee has continued its cooperation with committees of the Scientific Apparatus Makers of America and of other organizations on problems relating to the standardization of shapes, sizes, and quality of laboratory apparatus.

W. D. Collins, *Chairman*

Standard Methods for the Examination of Water and Sewage

(To Cooperate with the Committee of the American Public Health Association)

The committee has considered in detail a complete revision of methods for the examination of water including an entire reorganization of the present procedure. These recommendations will be presented to the joint committee of the cooperating societies at a meeting which is tentatively set for the week of June 21 in Chicago.

A. M. Buswell, *Chairman*

Standardization of Biological Stains

Although no meeting of the whole Executive Committee was held during 1941, two sectional meetings were held, one in Chicago and one in Philadelphia. Both meetings were attended by the chairman of the commission and it was thus possible for him to discuss several important matters with all the members.

Practically all foreign subscriptions to *Stain Technology* have been stopped but their loss has been compensated for to a great extent by the increase in domestic subscriptions. In order to overcome increased costs and the effect of the slight decrease in the number of subscriptions, the listed subscription price has been raised, but a special rate (no higher than the old rate) is granted to individual scientists and to scientific institutions who place their subscriptions directly with the publishing agent. The commission has continued its biological testing and chemical analyses of stains for certification. The increase in this work reported last year has continued at an accelerated rate. Up to a few years ago the number of samples of stains submitted for certification rarely exceeded 50. In 1940 this number was 71 and in 1941 the number of samples tested was well over 100. This increase has largely been due to orders placed by the Army and Navy for equipping their many medical units. In addition to the stains which have been tested in the past, a demand for other dyes has developed recently. It is probable that these are stains which were formerly supplied from Europe and are no longer available from that source. Also many users of stains who have been using German stains in the past have been confronted with the problem of adapting their procedures to the equally good or better American stains, a change which usually involves some modification of the technique. The commission has been called upon for assistance in solving many of these difficulties and stands ready, as always, to give what help it can in the solution of any biological staining problems.

The chemical testing of the stains

which, at the time of my last report, was being carried out in the chemical laboratories of the Philadelphia College of Pharmacy and Science, has now been moved to the Eastern Regional Research Laboratory of the United States Department of Agriculture, Chestnut Hill Station, Philadelphia, Penna., where it is being continued under a cooperative agreement between the Department of Agriculture and the commission.

The great increase in the demand for stains has improved the financial position of the commission considerably and sufficient funds are now available to continue the work for some time, even though the revenue should decline to the 1939 level.

JOHN T. SCANLAN, *Representative*

Standardized Methods for Vitamin Research

THE committee reports progress in the same sense as in previous years. Methods of working with vitamins are not likely soon to reach a point at which the SOCIETY would wish to give official adoption in the sense that it sometimes does to analytical methods when they have reached a sufficiently conclusive stage of development. This committee does, however, serve a sort of clearinghouse function which on the whole seems worth while and, if the AMERICAN CHEMICAL SOCIETY is disposed to continue its vitamin committee, I have no doubt the members of the committee will be glad to serve.

H. C. SHERMAN, *Chairman*

Supervision of Chemical Engineering Catalog

THE committee, which consists of representatives of the American Institute of Chemical Engineers, the AMERICAN CHEMICAL SOCIETY, the American Section of the Society of Chemical Industry, and the Salesmen's Association of the American Chemical Industry, has prepared a joint statement on the Chemical Engineering Catalog for the year 1941–42 which is as follows:

The sudden and rapid development of chemical industries during the First World War stimulated the demand for information which led to the inauguration of the Chemical Engineering Catalog in 1915. A similar, perhaps even greater, emergency confronts our industries today. With the passage of time the catalog has changed and developed just as have the process industries which it serves. To meet the urgent need for concise and accurate information as to equipment, supplies, and raw materials, the distribution of the Chemical Engineering Catalog has this year been stepped up to 15,000. At all times the demand for the catalog has exceeded the supply.

The Book Section has been brought up to date and constitutes a most complete bibliography of chemical technology.

The redistribution of returned copies of the catalog to universities and technical schools maintaining courses in chemical engineering has been continued and expanded. In this way the men to whom the process industries must look for technical direction in the future become habituated to the use of the catalog at the outset of their careers—a fact of great value to the firms represented in the book.

The committee hopes that the users of the catalog will cooperate with the publishers by making known at every possible opportunity the fact that it is being used by them to obtain information relating to purchases. The firms who spend their money for this service are naturally interested in having direct evidence that the publication is producing results for them. Also the committee will be glad at all times to receive suggestions from users of the catalog as to additional data that might well be included in it. The success of the enterprise to date is largely due to cooperation of this kind.

W. R. VEAZEY.
A. C. S. Representative

Supervisory on Standard Methods of Analysis

THE committee has approved the revised Standard Methods for the Sampling and Analysis of Commercial Soaps and Soap Products, which was submitted July 18, 1941. It awaits the approval of the Council.

H. H. WILLARD, *Chairman*

Teaching of Chemistry in High Schools

THE committee has held four meetings, at three of which there were three members present. We have outlined a program, have established contact with several groups of educators who are concerned with various phases of science instruction, and each member of our committee has undertaken to study conditions and inaugurate reforms in his own and in adjacent states. We agree that more effective, more complete, and more permanent improvements can be made by working with school authorities and teacher-training institutions than would be possible through legislative action. We hope first to improve the teaching of science in a few states by building up a better scientific background; then using the experience thus gained to expand the process to other localities.

The following projects have been selected as in most urgent need of attention:

Grouping of subjects in high school teaching programs so the sciences may be logically associated with each other and with allied subjects such as mathematics.

Soliciting the cooperation of high school inspectors in promoting a reasonable grouping of the sciences.

Urging the universities, colleges, and normal schools to direct the teacher-training process so the teachers of science in the small and medium-sized high schools may have at least an elementary training in all the subjects of the science group.

Arranging a system of licensing of graduates whose training in all the subjects of the science group is sufficient to permit them to qualify as teachers of science.

It is obvious that these projects are designed to help the smaller high schools. The committee believes that improvement is most urgently needed in schools of this type and that the larger schools where less diversity of subject matter is necessary are now on the average doing an excellent job of teaching chemistry and the other sciences.

B. S. HOPKINS, *Chairman*

Women's Service

THE committee submits the following report:

Studies

1. Women Registered in the Employment Clearing House. The committee has made inquiry concerning the number of women securing positions through the Employment Clearing House. It has been learned from the St. Louis and Atlantic City registrations that the number of women taking advantage of the Clearing House is small; of the total registration about 3 per cent at St. Louis and 5 per cent at Atlantic City were women. From interviews at the latter meeting, approximately one third of those registered accepted employment; the percentage of men registrants accepting employment was the same.

2. Women Chemists Displaced from Foreign Countries. The committee has felt concern for trained scientists forcefully displaced from other countries. It has found there are no special facilities in the AMERICAN CHEMICAL SOCIETY for aiding foreign chemists in finding employment; the difficulties lie largely in the exigencies of the prevailing war conditions.

3. Graduate Scholarships for Women in Chemistry. The committee has in hand some information concerning graduate scholarships in chemistry available to women. This study is not entirely complete; when completed it will be given to the succeeding Women's Service Committee.

Advisory Work

The committee has acted in an advisory capacity for a number of young women graduating from college seeking employment in chemical fields. It has also to a lesser extent advised with displaced foreign women chemists.

General Meeting

At the suggestion of the committee, the local chairmen on entertainment for women chemists at the St. Louis and Atlantic City meetings arranged late afternoon sessions at which time many women

chemists held profitable discussions on problems connected with their work.

Garvan Award

The committee has designated 1942 as the time at which the next Garvan Award may be made. The committee through canvassing has secured nominations for the award, and these have been forwarded to the Award Committee through the Secretary of the AMERICAN CHEMICAL SOCIETY.

MAY L. WHITSITT, *Chairman*

The A. C. S. Convention at Memphis

THE Memphis convention
Is but a memory,
An exceedingly pleasant memory—
Dean Rudd, Copson, and Isabel McKinnell.
Renewing old acquaintances
And winning a friend.
A fleeting glimpse of this one
With nod of recognition,
A friendly glance,
A word or two,
Or hours of reminiscence.
There were meetings, consultations,
Inspection trips, and papers.
There was the register one peruses
A friend to find.
Podbielniak and Baldeschwieler,
Per Frolich, Hooker, Jones, and Smith.
There were breakfasts, teas, and dinners.
There were cocktail parties, too.
Some parties were quite private,
But the banquet was for many.
There was dancing on the Skyway,
Sociability running high.
Now Memphis is a memory
And Buffalo still remote.
But make a pledge to be there,
A pledge you'll not revoke,
And no regrets.

A. BERNE-ALLEN, JR.

Box 369
WAYNESBORO, VA.

Lost and Found at Memphis

THE following articles were turned in to the Information Booth at the Memphis meeting under the lost and found service. They may be obtained by the owners, provided sufficient identification is offered, by contacting Jeff M. Hart, Jr., Laboratory Department, Firestone Tire & Rubber Co. of Tennessee, Memphis, Tenn.

Silver and black Parker pencil
Checkbook of Ruston State Bank & Trust Co., Ruston, La.
Pair of lady's black fabric-gloves
Brown felt hat, "Richards Clothes" label
Gray raincoat bearing name of Alison Smith

Theodore C. Swigert has been assigned to the Armored Force Research Laboratory, now under construction at Fort Knox, Ky., which will study problems pertinent to personnel and equipment, with a view to correcting existing difficulties and considering the human equation in tank warfare.

Society Officers, Committees, and Student Affiliate Chapters

Officers

THE list of officers of the SOCIETY appears in CHEMICAL AND ENGINEERING NEWS three times a year, usually February 10, May 10, and October 10.

National Officers and Directors

PRESIDENT. Harry N. Holmes, Severance Chemical Laboratory, Oberlin College, Oberlin, Ohio.

PRESIDENT-ELECT. Per K. Frolich, Standard Oil Development Co., Box 243, Elizabeth, N. J.

SECRETARY AND BUSINESS MANAGER. Charles L. Parsons, AMERICAN CHEMICAL SOCIETY BUILDING, 1155 16th St., N. W., Washington, D. C. *Assistant Manager*, Alden H. Emery.

TREASURER. Robert T. Baldwin, 50 East 41st St., New York, N. Y.

DIRECTORS. *Ex Officio*, the President, the President-Elect, the most recent Past President (William Lloyd Evans), the Secretary, and the Treasurer. *Regional*, L. H. Adams, R. E. Swain (1940–42); Roger Adams, R. E. Wilson (1941–43); Arthur J. Hill, E. R. Weidlein (1942–44). *At-Large*, Thomas Midgley, Jr. (1939–42); E. K. Bolton (1940–43); Willard H. Dow (1941–44); Charles A. Thomas (1942–45).

COUNSEL. Elisha Hanson.

Editors

JOURNAL OF THE AMERICAN CHEMICAL SOCIETY. Arthur B. Lamb, Chemical Laboratories, Harvard University, 12 Oxford St., Cambridge, Mass.

CHEMICAL ABSTRACTS. E. J. Crane, Ohio State University, Columbus, Ohio. *Assistant Editor*, Elmer Hockett.

INDUSTRIAL AND ENGINEERING CHEMISTRY and CHEMICAL AND ENGINEERING NEWS. H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Assistant to Editor*, N. A. Parkinson.

PUBLICATION MANAGER. Harvey F. Mack, 20th and Northampton Streets, Easton, Penna.

NEWS SERVICE. *Director*, H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Managing Editor*, James T. Grady, 609 Journalism Bldg., Columbia University, New York, N. Y.

MONOGRAPHS. H. E. Howe, 1155 16th St., N. W., Washington, D. C.

CHEMICAL REVIEWS. W. Albert Noyes, Jr., Department of Chemistry, University of Rochester, River Campus, Rochester, N. Y. *Assistant Editor*, Louise Kelley. Published by Williams & Wilkins Co., Baltimore, Md.

JOURNAL OF PHYSICAL CHEMISTRY. Samuel C. Lind, School of Chemistry, University of Minnesota, Minneapolis, Minn. *Assistant Editor*, Louise Kelley. Published by Williams & Wilkins Co., Baltimore, Md.

Members of Council

EX OFFICIO. *National Officers. Directors. Editors* of the *Journal of the American Chemical Society, Chemical Abstracts*, and *Industrial and Engineering Chemistry. Past Presidents*, Roger Adams, L. H. Baekeland, W. D. Bancroft, Edward Bartow, M. T. Bogert, Wm. Lloyd Evans, Moses Gomberg, C. A. Kraus, Arthur B. Lamb, Irving Langmuir, S. C. Lind, William McPherson, L. V. Redman, E. R. Weidlein, F. C. Whitmore, W. R. Whitney. *Chairmen of Divisions and Councilors of Local Sections* (listed under Divisional and Local Section Officers).

Councilors-at-Large. Edward Mack, Jr., C. E. K. Mees, W. Albert Noyes, Jr., H. C. Urey (1940–42); Wm. Mansfield Clark, H. B. Hass, J. H. Hildebrand, G. E. F. Lundell (1941–43); George D. Beal, Gustav Egloff, Henry Gilman, Carl S. Marvel (1942–44).

Divisional Officers

AGRICULTURAL AND FOOD. *Chairman*, Ellery H. Harvey; *Secretary*, Roger H. Lueck, Research Department, American Can Co., Maywood, Ill.

ANALYTICAL AND MICRO. *Chairman*, George L. Royer; *Secretary*, Francis W. Power, S.J., Fordham University, New York, N. Y.

BIOLOGICAL. *Chairman*, B. H. Nicolet; *Secretary*, Erwin Brand, 630 West 168th St., New York, N. Y.

CELLULOSE. *Chairman*, Elwin E. Harris; *Secretary*, Charles R. Fordyce, 275 Maplewood Drive, Rochester, N. Y.

CHEMICAL EDUCATION. *Chairman*, F. E. Brown; *Secretary*, Paul H. Fall, Hiram College, Hiram, Ohio.

COLLOID. *Chairman*, Fredrich Olsen; *Secretary*, J. W. McBain, 571 Foothill, Stanford University, Calif.

FERTILIZER. *Chairman*, H. B. Siems; *Secretary*, Charles A. Butt, International Minerals & Chemical Corp., Box 69, East Point, Ga.

GAS AND FUEL. *Chairman*, Orin W. Rees; *Secretary*, G. R. Yohe, State Geological Survey, Urbana, Ill.

HISTORY OF CHEMISTRY. *Chairman*, Harrison Hale; *Secretary*, Ralph E. Oesper, Department of Chemistry, University of Cincinnati, Cincinnati, Ohio.

INDUSTRIAL AND ENGINEERING CHEMISTRY. *Chairman*, Lawrence W. Bass; *Secretary*, Whitney Weinrich, Gulf Research & Development Co., Box 2038, Pittsburgh, Penna.

MEDICINAL CHEMISTRY. *Chairman*, John H. Gardner; *Secretary*, John H. Speer, Box 5110, Chicago, Ill.

ORGANIC. *Chairman*, Lee I. Smith; *Secretary*, Arthur C. Cope, Department of Chemistry, Columbia University, New York, N. Y.

PAINT, VARNISH, AND PLASTICS. *Chairman*, Shailer L. Bass; *Secretary*, Adolf C.

Elm, The New Jersey Zinc Co., Box 263, Palmerton, Penna.

PETROLEUM. *Chairman*, J. K. Roberts; *Acting Secretary*, L. M. Henderson, Northfield Laboratory, Box 266, Winnetka, Ill.

PHYSICAL AND INORGANIC. *Chairman*, W. C. Fernelius; *Secretary*, Oscar K. Rice, Department of Chemistry, University of North Carolina, Chapel Hill, N. C.

RUBBER. *Chairman*, John N. Street; *Secretary*, Howard I. Cramer, Sharples Chemicals, Inc., 23rd and Westmoreland Streets, Philadelphia, Penna.

SUGAR CHEMISTRY AND TECHNOLOGY. *Chairman*, Sidney M. Cantor; *Secretary*, E. Whitman Rice, National Sugar Refining Co., 129 Front St., New York, N. Y.

WATER, SEWAGE, AND SANITATION. *Chairman*, Charles S. Howard; *Secretary*, H. Gladys Swope, North Shore Sanitary District, Dahringer Road, Waukegan, Ill.

Local Section Officers

AKRON. *Chairman*, Winfield Scott; *Secretary*, Albert J. Gracia. 1639 Ohio St., Cuyahoga Falls, Ohio; *Councilors*, W. I. Burt, E. G. Haas, M. M. Harrison, C. K. Novotny.

ALABAMA. *Chairman*, George D. Palmer; *Secretary*, Harold E. Wilcox, 7837 Fifth Ave., South, Birmingham, Ala.; *Councilors*, S. S. Heide, J. T. Vann.

AMES. *Chairman*, Henry A. Webber; *Secretary*, Harvey C. Diehl, Department of Chemistry, Iowa State College, Ames, Iowa; *Councilors*, N. A. Clark, L. A. Underkofler.

BATON ROUGE. *Chairman*, Arthur G. Keller; *Secretary*, Sumner B. Sweetser, 2960 Hyacinth Ave., Baton Rouge, La.; *Councilors*, C. L. Brown, A. R. Choppin.

BINGHAMTON. *Chairman*, August H. Brunner, Jr.; *Secretary*, Frank J. Kaszuba, 100 Gilmore Ave., R. D. 3, Binghamton, N. Y.; *Councilor*, Maurice Dorfman.

CALIFORNIA. *Chairman*, Paul F. Bovard; *Secretary*, Sterling L. Redman, 585 Howard St., San Francisco, Calif.; *Councilors*, Ross Cummings, T. C. Daniels, Dozier Finley, William Hirschkind, L. B. Howard, C. R. Noller, Merle Randall, L. V. Steck, Frank Wills.

CENTRAL PENNSYLVANIA. *Chairman*, Arthur Rose; *Secretary*, N. B. Guerrant, Department of Biochemistry, Pennsylvania State College, State College, Penna.; *Councilors*, R. A. Dutcher, C. C. Wright.

CENTRAL TEXAS. *Chairman*, W. A. Cunningham; *Secretary*, Maxwell A. Pollack, Chemistry Department, The University of Texas, Austin, Tex.; *Councilors*, H. R. Henze, H. L. Lochte.

CHICAGO. *Chairman*, Warren C. Johnson; *Secretary*, James J. Doheny, Jr., 4247 West End Ave., Chicago, Ill.: *Councilors*, Howard Adler, E. B. Carter, Victor Conquest, J. J. Doheny, Jr., W. V. Evans, B. B. Freud, Arthur Guillaudeu, L. M. Henderson, W. F. Henderson, C. D. Hurd, W. C. Johnson, L. E. May, M. C. Morrell, R. C. Newton, H. E. Robinson, M. C. Rogers, B. E. Schaar, H. I. Schlesinger, E. H. Volwiler, R. E. Zinn.

CINCINNATI. *Chairman*, Frederick E. Holmes; *Secretary*, Ronald C. Stillman, 1578 Reid Ave., Cincinnati, Ohio; *Councilors*, R. F. Brown, D. J. Kooyman, R. E. Oesper, C. C. Ruchhoft.

CLEVELAND. *Chairman*, Eric A. Arnold; *Secretary*, M. R. Hatfield, Research Laboratory, National Carbon Co., Cleveland, Ohio; *Councilors*, E. A. Arnold, H. S. Booth, G. H. McIntyre, L. E. Steiner, J. C. Weaver.

COLORADO. *Chairman*, H. B. Van Valkenburgh; *Secretary*, Robert W. Virtue, University of Denver, Denver, Colo.; *Councilors*, W. W. Howe, S. A. Powell.

COLUMBUS. *Chairman*, Richard S. Shutt; *Secretary*, Melvin S. Newman, Department of Chemistry, Ohio State University, Columbus, Ohio; *Councilors*, C. E. Boord, W. A. Manuel, M. L. Wolfrom.

CONNECTICUT VALLEY. *Chairman*, Samuel E. Q. Ashley; *Secretary*, Harold S. Schwenk, University of Connecticut, Storrs, Conn.; *Councilors*, R. D. Dunlop, G. A. Hill, M. L. Sherrill.

CORNELL. *Chairman*, Albert W. Laubengayer; *Secretary*, William T. Miller, Jr., Department of Chemistry, Cornell University, Ithaca, N. Y.; *Councilor*, John R. Johnson.

DALLAS-FORT WORTH. *Chairman*, Manuel H. Gorin; *Secretary*, J. M. Hersh, Magnolia Petroleum Co., 1920 McKinney Ave., Dallas, Tex.; *Councilors*, W. H. Clark, J. L. Whitman.

DAYTON. *Chairman*, Nicholas N. T. Samaras; *Secretary*, Vincent J. Wottle, University of Dayton, Dayton, Ohio; *Councilors*, M. E. Haas, A. M. Patterson.

DELAWARE. *Chairman*, Samuel Lenher; *Secretary*, S. S. Rossander, 1502 Woodsdale Road, Bellevue Manor, Wilmington, Del.; *Councilors*, R. F. Conaway, H. R. Dittmar, M. R. Goepp, E. O. Kraemer, G. G. Lahr, Emil Ott, Wm. E. Shaefer, H. W. Starkweather.

DETROIT. *Chairman*, R. D. Hummel; *Secretary*, Frances W. Lamb, 17140 Third Ave., Detroit, Mich.; *Councilors*, George Calingaert, J. J. Jasper, Helen I. Miner, Arthur Rautenberg, L. A. Sweet, T. H. Vaughn.

EAST TENNESSEE. *Chairman*, Robert R. Ralston; *Secretary*, Eric Winters, Department of Agronomy, University of Tennessee, Knoxville, Tenn.; *Councilor*, J. H. Wood.

EASTERN NEW YORK. *Chairman*, Francis J Norton; *Secretary*, E. K. Bacon, Chemical Laboratory, Union College, Schenectady, N. Y.; *Councilors*, H. M. Faigenbaum, Arthur Knudson, A. L. Marshall.

ERIE. *Chairman*, William F. Reichert; *Secretary*, Christian H. Steinford, 3506 Holland St., Erie, Penna.; *Councilor*, Sister Doloretta Thorn.

FLORIDA. *Chairman*, Isabel McKinnell; *Secretary*, R. B. French, Agricultural Experiment Station, University of Florida, Gainesville, Fla.; *Councilors*, J. P. Bain, A. T. Cole.

GEORGIA. *Chairman*, John J. McManus; *Secretary*, R. A. Day, Jr., Chemistry Building, Emory University, Emory University, Ga.; *Councilors*, J. S. Guy, H. M. Waddle.

HAWAII. *Chairman*, O. C. McBride; *Secretary*, J. H. Payne, Pacific Guano & Fertilizer Co., P. O. Box 48, Honolulu, T. H. *Councilor*, Martha Potgieter

ILLINOIS-IOWA. *Chairman*, Arthur N. Johnson; *Secretary*, M. R. Hoppe, Parr Instrument Co., Moline, Ill.; *Councilor*, J. F. Goggin.

INDIANA. *Chairman*, Neil Kershaw; *Secretary*, John A. Leighty, 4301 East 38th St., Indianapolis, Ind.; *Councilors*, William Higburg, E. H. Niles, J. L. Riebsomer, E. H. Stuart.

IOWA. *Chairman*, L. C. Raiford; *Secretary*, Joseph I. Routh, Chemistry Building, State University of Iowa, Iowa City, Iowa; *Councilor*, Wm. G. Eversole.

KANAWHA VALLEY. *Chairman*, Ashby C. Blackwell; *Secretary*, Alfred W. Downes, 506 Highland Ave., South Charleston, W. Va.; *Councilors*, H. L. Cox, Whitfield Price, W. E. Vail.

KANSAS CITY. *Chairman*, Leonard V. Sorg; *Secretary*, Clarence W. Sondern, George A. Breon & Co., Inc., Box 769, Kansas City, Mo.; *Councilors*, J. A. Austin, R. Q Brewster.

KANSAS STATE COLLEGE. *Chairman*, A. C. Andrews; *Secretary*, Alfred T. Perkins, Kansas State College, Manhattan, Kans.; *Councilor*, H. H. King.

LEHIGH VALLEY. *Chairman*, R. Graham Cook; *Secretary*, W. H. Holst, Box 175, Tamaqua, Penna.; *Councilors*, E. A. Engle, H. A. Neville, C. D. Pratt.

LEXINGTON. *Chairman*, Julian H. Capps; *Secretary*, Martin E. Weeks, Experiment Station, University of Kentucky, Lexington, Ky.; *Councilor*, W. A. Hensley.

LOUISIANA. *Chairman*, A. W. Chapman; *Secretary*, Worden Waring, Department of Chemistry, College of Arts and Sciences, Tulane University, New Orleans, La.; *Councilors*, H. A. Levey, H. P. Newton.

LOUISVILLE. *Chairman*, Paul A. Kolachov; *Secretary*, Richard B. Ellis, Joseph E. Seagram & Sons, Inc., Louisville, Ky.; *Councilors*, R. C. Ernst, A. W. Homberger.

MAINE. *Chairman*, Samuel E. Kamerling; *Secretary pro tem.*, Wm. C. Root, 80 Federal St., Brunswick, Maine; *Councilor*, F. T. Martin.

MARYLAND. *Chairman*, Paul H. Emmett; *Secretary*, Channing W. Wilson, 4122 Westview Road, Baltimore, Md.; *Councilors*, A. H. Corwin, W. H. Hartung, Duncan MacRae, S. B. Schofield.

MEMPHIS. *Chairman*, Thomas P. Nash, Jr.; *Secretary*, E. F. Williams, 874 Union Ave., Memphis, Tenn.; *Councilor*, J. R. Meadow.

MICHIGAN STATE COLLEGE. *Chairman*, C. D. Ball, Jr.; *Secretary*, Clifford W. Duncan, 618 Butterfield Drive, East Lansing, Mich.; *Councilor*, D. T. Ewing.

MIDLAND. *Chairman*, J. D. Hanawalt; *Secretary*, John J. Grebe, Dow Chemical Co., Midland, Mich.; *Councilors*, E. C. Britton, W. R. Veazey.

MILWAUKEE. *Chairman*, Robert R. Austin; *Secretary*, Robert O. Guettler, 3710 North Morris Blvd., Shorewood, Wis.; *Councilors*, N. A. Thomas, H. H. Tucker.

MINNESOTA. *Chairman*, G. O. Burr; *Secretary*, Edward J. Meehan, Chemistry Department, University of Minnesota, Minneapolis, Minn.; *Councilors*, C. G. Ferrari, W. M. Lauer, R. E. Montonna.

MONTANA. *Chairman*, John F. Suchy; *Secretary*, Ray Woodriff, Chemistry Department, Montana State College, Bozeman, Mont.; *Councilor*, O. E. Sheppard.

NASHVILLE. *Chairman*, W. P. Fishel; *Secretary*, Hanor A. Webb, Department of Chemistry, George Peabody College for Teachers, Nashville, Tenn.; *Councilor*, W. C. Sumpter.

NEBRASKA. *Chairman*, Carl E. Georgi; *Secretary*, Norman H. Cromwell, Department of Chemistry and Chemical Engineering, University of Nebraska, Lincoln, Nebr.; *Councilor*, E. R. Washburn.

NEW HAVEN. *Chairman*, Herbert S. Harned; *Secretary*, Harding Bliss, Sterling Chemistry Laboratory, Yale University, New Haven, Conn.; *Councilors*, Clinton Doede, C. C. Furnas.

NEW YORK. *Chairman*, Ralph H. Müller; *Secretary*, Cornelia T. Snell, 66 Park Ave.,

New York, N. Y.; *Councilors*, M. Irene Bailey, H. H. Baker, Jr., R. A. Baker, J. J. Beaver, A. T. Burtsell, W. E. Cass, C. R. Dawson, M. E. Dros, E. J. Durham, V. du Vigneaud, R. C. Elderfield, A. S. Elsenbast, S. F. Gaffin, W. H. Gardner, R. G. Gould, Jr., H. W. Hermance, H. A. Horan, W. R. Johnston, D. H. Killeffer, S. D. Kirkpatrick, F. S. Low, S. P. Miller, W. F. O'Connor, Donald Price, W. M. Ralph, E. W. Rice, F. D. Snell, A. H. Tenney, L. A. Wooten.

NORTH CAROLINA. *Chairman*, Ivan D. Jones; *Secretary*, Sherman E. Smith, Department of Chemistry, University of North Carolina, Chapel Hill, N. C.; *Councilors*, R. W. Bost, P. M. Gross.

NORTH JERSEY. *Chairman*, Delmer L. Cottle; *Secretary*, Henry J. Wing, 21 Elm Place, Milltown, N. J.; *Councilors*, C. R. Addinall, E. R. Allen, J. B. Austin, J. A. Bradley, A. E. Brooks, F. E. Carruth, Thomas Cifelli, Jr., M. L. Crossley, H. F. Jordan, R. H. Kienle, R. T. Major, R. J. Moore, S. O. Morgan, E. B. Peck, R. D. Reed, William Rieman, III, H. F. Wakefield, R. E. Waterman.

NORTHEAST TENNESSEE. *Chairman*, Matthew Weber, Jr.; *Secretary*, Joseph H. Brant, Research and Development Division, Tennessee Eastman Corp., Kingsport, Tenn.; *Councilor*, J. R. Caldwell.

NORTHEAST WISCONSIN. *Chairman*, J. O. Frank; *Secretary*, John W. Green, The Institute of Paper Chemistry, Appleton, Wis.; *Councilor*, H. F. Lewis.

NORTHEASTERN. *Chairman*, Avery A. Ashdown; *Secretary*, Alberto F. Thompson, Jr., Eastman Chemical Laboratory, Massachusetts Institute of Technology, Cambridge, Mass.; *Councilors*, G. R. Alden, C. M. Alter, A. A. Blanchard, R. D. Eddy, G. J. Esselen, J. J. Healy, Jr., F. C. Howard, H. A. Iddles, Grinnell Jones, A. A. Morton, Deborah Russell, Florence C. Sargent.

NORTHERN WEST VIRGINIA. *Chairman*, A. J. W. Headlee; *Secretary*, P. Lloyd MacLachlan, Department of Biochemistry, Medical School, West Virginia University, Morgantown, W. Va.; *Councilor*, I. J. Duncan.

NORTHWESTERN UTAH. *Chairman*, John R. Lewis; *Secretary*, G. Victor Beard, Chemistry Department, University of Utah, Salt Lake City, Utah; *Councilor*, W. D. Bonner.

OKLAHOMA. *Chairman*, Harold M. Smith; *Secretary*, L. F. Sheerar, Department of Chemical Engineering, Oklahoma A. & M. College, Stillwater, Okla.; *Councilors*, B. C. Frichot, J. P. Jones, B. W. Logue.

OMAHA. *Chairman*, Wm. Dean Yohe; *Secretary*, R. R. Briggs, Nebraska Power Co., Omaha, Nebr.; *Councilor*, C. L. Kenny.

OREGON. *Chairman*, Glenn C. Ware; *Secretary*, Francis T. Jones, 210 North A St., Forest Grove, Oreg.; *Councilor*, C. S. Pease.

PANHANDLE PLAINS. *Chairman*, W. M. Deaton; *Secretary*, E. M. Frost, Jr., 815 Fairmont St., Amarillo, Tex.; *Councilor*, R. G. Atkinson.

PENNSYLVANIA–NEW YORK WESTERN BORDER. *Chairman*, Russell E. Palmateer; *Secretary*, Everett J. Schneider, 236 West Fourth St., Emporium, Penna.; *Councilor*, R. W. Hufferd.

PEORIA. *Chairman*, Gerald C. Baker; *Secretary*, L. Gerber, 601 Linn St., Peoria, Ill.; *Councilors*, R. I. Classon, R. D. Coghill.

PHILADELPHIA. *Chairman*, S. W. Ferris; *Secretary*, Lyle L. Jenne, 825 City Hall Annex, Philadelphia, Penna.; *Councilors*, W. G. Batt, J. L. Crenshaw, E. L. Haenisch, J. W. E. Harrisson, J. B. Hill, L. C. Hurd, H. S. Lukens, W. B. Meldrum, Arthur Osol, H. C. Porter, P. E. Rollhaus, William Stericker, L. D. Stratton, F. T. Tyson.

PITTSBURGH. *Chairman*, J. C. Warner; *Secretary*, Ralph W. Bridges, Aluminum Research Laboratories, Box 772, New Kensington, Penna.; *Councilors*, F. W. Adams, L. H. Almy, H. V. Churchill, L. H. Cretcher, J. D. Edwards, C. G. King, J. N. Roche, E. K. Wallace, W. P. Yant.

PRINCETON. *Chairman*, Hubert N. Alyea; *Secretary*, John F. Lane, Frick Chemical Laboratory, Princeton University, Princeton, N. J.; *Councilor*, H. S. Taylor.

PUGET SOUND. *Chairman*, W. L. Beuschlein; *Secretary*, Victorian Siverts, Department of Chemistry, University of Washington, Seattle, Wash.; *Councilors*, A. L. Knisoley, R. J. Robinson.

PURDUE. *Chairman*, F. D. Martin; *Secretary*, Fred J. Allen, Chemistry Department, Purdue University, West Lafayette, Ind.; *Councilor*, M. G. Mellon.

RHODE ISLAND. *Chairman*, Dana Burks, Jr.; *Secretary*, W. George Parks, Department of Chemistry, Rhode Island State College, Kingston, R. I.; *Councilors*, P. C. Cross, J. P. Howe.

ROCHESTER. *Chairman*, Harold C. Hodge; *Secretary*, Thomas F. Murray, Jr., Research Laboratories, Eastman Kodak Co., Rochester, N. Y.; *Councilors*, F. R. Baxter, E. K. Carver, C. R. Fordyce, R. W. Helmkamp, D. K. Tressler.

SACRAMENTO. *Chairman*, C. E. Larson; *Secretary*, L. M. Lampert, State Office Building No. 1, Sacramento, Calif.; *Councilor*, F. W. Bunyan.

ST. JOSEPH VALLEY. *Chairman*, Henry J. Klooster; *Secretary*, P. A. McCusker, Chemistry Department, University of Notre Dame, Notre Dame, Ind.; *Councilor*, H. B. Froning.

ST. LOUIS. *Chairman*, Fredrich Olsen; *Secretary*, Henry A. Carlton, Mallinckrodt Chemical Works, 3600 North Second St., St. Louis, Mo.; *Councilors*, H. L. Dahm, P. A. Krueger, LeRoy McMaster, R. B. Semple, L. J. Wood.

SAN DIEGO. *Chairman*, Ambrose R. Nichols, Jr.; *Secretary*, Viola Sommermeyer, 301 Medico Dental Bldg., San Diego, Calif.; *Councilor*, D. E. Clark.

SIOUX VALLEY. *Chairman*, A. R. Hershberger; *Secretary*, Ernest Griswold, Department of Chemistry, University of South Dakota, Vermillion, S. Dak.; *Councilor*, L. S. Guss.

SOUTH CAROLINA. *Chairman*, Maston T. Carlisle; *Secretary*, Willard A. Whitesell, 307 Southwood Road, Columbia, S. C.; *Councilor*, J. E. Mills.

SOUTH JERSEY. *Chairman*, Clifford E. Carr; *Secretary*, Arlie A. O'Kelly, 78 North American St., Woodbury, N. J.; *Councilors*, H. G. Berger, W. S. Calcott, J. M. Tinker.

SOUTHEAST KANSAS. *Chairman*, Everett J. Ritchie; *Secretary*, O. W. Chapman, Chemistry Department, Kansas State Teachers College, Pittsburg, Kans.; *Councilor*, J. H. Davidson.

SOUTHEAST TENNESSEE. *Chairman*, Emerson P. Poste; *Secretary*, William O. Swan, University of Chattanooga, Chattanooga, Tenn.; *Councilor*, I. W. Grote.

SOUTHEASTERN PENNSYLVANIA. *Chairman*, Edmund Claxton; *Secretary*, H. A. Reehling, Revonah Spinning Mills, Hanover, Penna.; *Councilor*, R. W. Higgins.

SOUTHEASTERN TEXAS. *Chairman*, M. C. Van Gundy; *Secretary*, E. P. Doremus, Jr., Research Laboratory, Shell Refinery, Deer Park, Tex.; *Councilors*, I. S. Cliff, A. J. Hartsook, R. H. Price.

SOUTHERN CALIFORNIA. *Chairman*, Wm. G. Young; *Secretary*, Harry V. Welch, Western Precipitation Co., 1016 West Ninth St., Los Angeles, Calif.; *Councilors*, G. A. Alles, L. R. Brantley, W. A. Bush, H. N. McCoy, L. C. Pauling, J. B. Ramsey, R. W. Truesdail.

SYRACUSE. *Chairman*, Edwin C. Jahn; *Secretary*, Frank Porter, Solvay Process Co., Nitrogen Division, Syracuse, N. Y.; *Councilors*, A. L. Elder, P. A. Keene.

TEXAS A. & M. *Chairman*, J. D. Lindsay; *Secretary*, G. S. Fraps, College Station, Tex.; *Councilor*, H. H. Garretson.

TOLEDO. *Chairman*, Harold F. Stose; *Secretary*, John J. Thornton, De Sales College, Toledo, Ohio; *Councilor*, J. H. Toulouse.

UNIVERSITY OF ILLINOIS. *Chairman*, B. S. Hopkins; *Secretary*, H. R. Snyder, 210 Noyes Laboratory, University of Illinois, Urbana, Ill.; *Councilors*, L. F. Audrieth, R. E. Greenfield, G. F. Smith.

UNIVERSITY OF MICHIGAN. *Chairman*, L. O. Case; *Secretary*, Lawrence O. Brockway, Department of Chemistry, University of Michigan, Ann Arbor, Mich.; *Councilor*, H. H. Willard.

UNIVERSITY OF MISSOURI. *Chairman*, L. D. Haigh; *Acting Secretary*, F. Emmett Jacob, Jr., 210 Schweitzer Hall, University of Missouri, Columbia, Mo.; *Councilor*, H. E. French.

VIRGINIA. *Acting Chairman*, H. R. Hamner; *Secretary*, E. S. Harlow, The American Tobacco Co., Box 4178, Richmond, Va.; *Councilors*, W. C. Jones, S. S. Negus, J. H. Yoe.

VIRGINIA BLUE RIDGE. *Chairman*, C. L. Crockett; *Secretary*, B. W. Waring, Chemical Laboratory, Norfolk & Western Railway, Roanoke, Va.; *Councilor*, J. W. Watson.

WASHINGTON. *Chairman*, Norman Bekkedahl; *Secretary*, Edgar R. Smith, National Bureau of Standards, Washington, D. C.; *Councilors*, W. D. Collins, N. L. Drake, H. L. J. Haller, R. M. Hann, J. H. Hibben, F. O. Rice, F. D. Rossini, M. X. Sullivan, E. Wichers.

WASHINGTON–IDAHO BORDER. *Chairman*, E. V. White; *Secretary*, Andrew van Hook, Department of Chemistry, University of Idaho, Moscow, Idaho; *Councilor*, R. W. Gelbach.

WESTERN CONNECTICUT. *Chairman*, R. Bowling Barnes; *Secretary*, William C. Moore, 42 Chesterfield Road, Shippan Point, Stamford, Conn.; *Councilors*, H. L. Fisher, F. P. Lasseter, Lois W. Woodford.

WESTERN MARYLAND. *Chairman*, John L. Baggett; *Secretary*, Dustin Y. Miller, 418 Avirett Ave., Cumberland, Md.; *Councilor*, G. W. Seymour.

WESTERN NEW YORK. *Chairman*, Wilmer H. Koch; *Secretary*, Edward F. Wesp, E. I. du Pont de Nemours & Co., Inc., Station B, Buffalo, N. Y.; *Councilors*, W. K. Eglof, W. L. Hyden, C. J. Kinzie, H. W. Post, C. H. Rasch, M. C. Taylor.

WESTERN VERMONT. *Chairman*, E. B. Womack; *Secretary*, Constance L. Brown, Williams Science Hall, University of Vermont, Burlington, Vt.; *Councilor*, H. C. Hamilton.

WICHITA. *Chairman*, W. E. Perdew; *Secretary* L. A. Enberg, East Plant No. 2, Carey Salt Co., Hutchinson, Kans.; *Councilor*, R. E. Puckett.

WILSON DAM. *Chairman*, G. L. Bridger; *Secretary*, Robert A. Wilson, Box 1364, Wilson Dam, Ala.; *Councilor*, J. W. H. Aldred.

WISCONSIN. *Chairman*, John W. Williams;

Secretary, Joseph O. Hirschfelder, Department of Chemistry, University of Wisconsin, Madison, Wis.; *Councilors*, Homer Adkins, N. F. Hall.

WOOSTER (OHIO). *Chairman*, Milton P. Puterbaugh; *Secretary*, John W. Chittum, 722 North Bever St., Wooster, Ohio; *Councilor*, R. I. Grady.

Committees

(April 1942 to April 1943)

Members of the SOCIETY should note that these committees are *their* committees. Some of these committees deal with very general and all-important problems. They desire to serve as clearing houses and are anxious to have suggestions and thoughts from individual members. Send your suggestions to the chairman of the committee. There is no committee so able or representative that it cannot profit by the individual ideas of the membership.

Advisory to the Bureau of Mines and National Bureau of Standards on Nonferrous Metals. *A. C. S. Representative on the Committee:* Wm. B. Price, Scoville Mfg. Co., Waterbury, Conn.

Analysis of Commercial Fats and Oils (established 1926). *Chairman*, V. C. Mehlenbacher, 112 South La Grange Road, La Grange, Ill.; J. Fitelson, W. D. Hutchins, M. L. Laing, C. P. Long, K. S. Markley, J. E. Maroney, L. B. Parsons, W. J. Reese, H. A. Schuette, M. L. Sheely, S. O. Sorensen, L. M. Tolman, H. P. Trevithick, F. C. Woekel.

Analytical Reagents (established 1917). *Chairman*, Edward Wichers, 113 West Woodbine St., Chevy Chase, Md.; A. Q. Butler, W. D. Collins, P. H. Messinger R. A. Osborn, Joseph Rosin, John F. Ross.

Annual Report on Atomic Weights (established 1897). G. P. Baxter, Coolidge Memorial Laboratory, Cambridge, Mass.

Award Committees:

American Chemical Society Award in Pure Chemistry (established 1931). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1943:* George Scatchard. *Term expires April 30, 1944:* Ralph L. Shriner. *Term expires April 30, 1945:* Joel H. Hildebrand.

Borden Co. Award in Chemistry of Milk (established 1938). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1943:* R. C. Newton. *Term expires April 30, 1944:* R. Adams Dutcher. *Term expires April 30, 1945:* George E. Holm.

Eli Lilly and Company Award in Biological Chemistry (established 1934). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1943:* M. L. Crossley. *Term expires April 30, 1944:* Lyndon F. Small. *Term expires April 30, 1945:* C. A. Elvehjem.

Chemical Service to Medicine (established 1939). (Committee reports to the Directors) *Chairman*, Vincent du Vigneaud, Cornell University Medical School, 1300 York Ave., New York, N. Y.; H. T. Clarke, W. G. Karr, V. C. Myers, A. E. Osterberg, D. D. Van Slyke.

Cooperation with Chemical Warfare Service (established 1920). *Chairman*, H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Research:* Roger Adams, Per K. Frolich, C. A. Kraus, A. B. Lamb, W. A. Noyes, Jr., E. R. Weidlein, F. C. Whitmore. *Development:* Bradley Dewey, W. K. Lewis, G. A. Richter, C. M. A. Stine, L. T. Sutherland. *Production:* G. O. Curme, Jr., W. H. Dow, L. C. Jones, M. C. Whitaker. *Physiological:* Wm. Mansfield Clark, Paul D. Lamson, E. K. Marshall, Jr., D. D. Van Slyke, Vincent du Vigneaud.

Cooperation with National Defense Research Committee (established 1940). (Committee reports to the Directors.) *Chairman*, Roger Adams, Chemistry Laboratory, University of Illinois, Urbana, Ill.; Harry N. Holmes, Thomas Midgley, Jr., *Ex Officio;* J. B. Conant, W. K. Lewis, Charles L. Parsons, E. R. Weidlein, R. E. Wilson.

Council Policy (established 1923). *Ex Officio: Chairman*, Harry N. Holmes, Severance Chemical Laboratory, Oberlin College, Oberlin, Ohio; Robert T. Baldwin, E. J. Crane, Wm. Lloyd Evans, Per K. Frolich, H. E. Howe, A. B. Lamb, Thomas Midgley, Jr, Charles L. Parsons. *Term expires December 1942:* Erle M. Billings. *Term expires December 1943:* G. J. Esselen. *Term expires December 1944:* Walter A. Schmidt.

Economic Status (established 1941). *Chairman*, Lawrence W Bass, New England Industrial Research Foundation, Inc., 137 Newbury St., Boston, Mass.; George Calingaert, Walter A. Schmidt, Walter G. Whitman, F. C. Whitmore.

Exchange (established 1907). *Chairman*, E J. Crane, *Chemical Abstracts*, Ohio State University, Columbus, Ohio; H. E. Howe, A. B. Lamb.

Hazardous Chemicals and Explosives, to Cooperate with National Fire Protection Association Committee on the same subject (established 1923). *Chairman*, George W. Jones, U. S. Bureau of Mines, Pittsburgh, Penna.; F. F. Chapman, A. H. Nuckolls.

Industrial Alcohol (established 1921). *Chairman*, Martin H. Ittner, Colgate-Palmolive-Peet Co., Jersey City, N. J.; R. F. Bacon, J. H. Beal, J. G. Davidson, W. H. Dow, E. H. Killheffer, R. H. McKee, H. W. Rhodehamel.

Licensing Inquiry (established 1939). *Chairman*, Frederic W. Willard, 12 Hawthorn Place, Summit, N. J.; Arthur Guillaudeu, H. S. Lukens, Foster D. Snell.

Membership (established 1876). *Chairman*, W. D. Collins, U. S. Geological Survey, Washington, D. C.; H. E. Howe, Charles L. Parsons.

National Research Council Representatives from A. C. S. on Division of Chemistry and Chemical Technology. *Terms expire July 1, 1942:* Per K. Frolich, John R. Johnson. *Terms expire July 1, 1943:* G. J. Esselen, Paul M. Gross *Terms expire July 1, 1944:* L. W. Bass, H. M. Chadwell.

Nomenclature, Spelling, and Pronunciation (established 1894). *Chairman*, E. J. Crane, *Chemical Abstracts*, Ohio State University, Columbus, Ohio; Board of Editors of the *Journal of the American Chemical Society;* Editor of *Industrial and Engineering Chemistry;* L. T. Capell, A. M. Patterson, Janet D. Scott.

Paper (established 1908). *Chairman*, Byron L. Wehmhoff, 6506 Brennon Lane, Chevy Chase, Md.; B. W. Scribner, H. J. Skinner

Patent and Related Legislation (established 1899). *Chairman*, Walter A. Schmidt, 1016 West Ninth St., Los Angeles, Calif.; Robert T. Baldwin, F. E. Barrows, F. G. Breyer, Bruce K. Brown, Henry Howard, Nelson Littell, J. C. Morrell, O. W. Storey, H. T. Stowell, E. H. Volwiler.

Professional Training of Chemists (established 1936). *Chairman*, W. Albert Noyes, Jr., Department of Chemistry, University of Rochester, River Campus, Rochester, N. Y. *Secretary* (member *ex officio*), Erle M. Billings, 343 State St., Rochester, N. Y. *Term expires April 30, 1943:* W. G. Young. *Term expires April 30, 1944:* Harry B. Weiser. *Term expires April 30, 1945:* W. Albert Noyes, Jr. *Term expires April 30, 1946:* S. C. Lind.

Soap and Soap Products (established 1935). *Chairman*, F. W. Smither, National Bureau of Standards, Washington, D. C.; R. E. Divine, J. E. Doherty, C. P. Long, E. B. Millard, M. L. Sheely, H. P. Trevithick.

Standard Apparatus (established 1917). *Chairman*, W. D. Collins, U. S. Geological Survey, Washington, D. C.; J. V. Freeman, R. A. Osborn, Lyon Southworth, Edward Wichers, H. H. Willard.

Standard Methods for the Examination of Water and Sewage, to Cooperate with the Committee of the American Public Health Association (established 1920). *Chairman*, Arthur M. Buswell, University of Illinois, Urbana, Ill.; W. D. Collins, C. R. Hoover, F. W. Mohlman, F. G. Straub.

Standardization of Biological Stains (established 1924). *A. C. S. Representative on the Commission:* John T. Scanlan, Eastern Regional Research Laboratory, U. S. Department of Agriculture, Chestnut Hill, Philadelphia, Penna.

Standardized Methods for Vitamin Research (established 1921). *Chairman*, Edward A. Doisy, 1402 South Grand Ave., St. Louis, Mo.; A. D. Emmett, C. G. King, E. V. McCollum, E. M. Nelson.

Study Problem of the Teaching of Chemistry in High Schools (established 1941). *Chairman*, B. S. Hopkins, Chemistry Laboratory, University of Illinois, Urbana, Ill.; H. N. Alyea, M. V. McGill, A. W. Scott.

Supervision of Chemical Engineering Catalog (established 1915). W. R. Veazey, Dow Chemical Co., Midland, Mich.

Supervisory on Standard Methods of Analysis (established 1910). *Chairman*, H. H. Willard, 208 Chemistry Bldg., University of Michigan, Ann Arbor, Mich.; B. L. Clarke, I. M. Kolthoff, G. E. F. Lundell, W. W. Skinner.

Women's Service (established 1927). *Chairman*, May L. Whitsitt, Department of Chemistry, Southern Methodist University, Dallas, Tex.; Mildred Adams, H. Marjorie Crawford, Rachel H. Edgar, Mildred W. Grafflin, Gertrude Vermillion

National Academy of Sciences Elects Honorary Members

THE National Academy of Sciences elected 15 persons to honorary membership at the business session during its annual meeting, April 28, in Washington, D. C. Eight of those so honored are members of the AMERICAN CHEMICAL SOCIETY: Homer B. Adkins, University of Wisconsin; Hans T. Clarke, Columbia University; Conrad A. Elvehjem, University of Wisconsin; Michael Heidelberger, Columbia University; John G. Kirkwood, Cornell University; Paul D. Merica, International Nickel Co.; Thomas Midgley, Jr., Worthington, Ohio; and Selman A. Waksman, New Jersey Agricultural Experiment Station.

POTOMAC POSTSCRIPTS

WPB Activities

Benzene. Order M-137 halts the use of benzene in motor fuel, with the exception that any producer or distributor may use before May 20 one sixth of the amount he used for the three months ended March 31. Benzene is added to motor fuel as an anti-knock ingredient, either in addition to or in place of tetraethyllead. It is a principal source of styrene, one of the main ingredients of Buna rubber. Although production is on the increase, both demands cannot be met. The order specifically exempts benzene used in the production of aviation fuel with an octane rating higher than 87.

Chlorine. A change in the method of computing the permissible use of chlorine in the treatment of rag stock under General Limitation Order L-11 has been ordered. Order L-11 limited the use of chlorine in the treatment of rag stock according to the total amount consumed during a base period. Amendment 1, effective April 20, changes the basis of limitation to the amount used per ton of rag stock treated. The effect is to afford relief to some paper mills which were already conserving chlorine during the base period by using a minimum amount per ton and whose production has been unduly restricted under the original method of computation.

Compressors. Heavy compressors, urgently needed in the war production program, have been placed under a system of complete allocations. The synthetic rubber, toluene, aviation gas, aviation lubricating oil, and oxygen and ammonia programs require large numbers of compressors. More are needed in tank, plane, aluminum, and steel plants. Total needs for the period ending April 1, 1943, are in excess of the available capacity of the industry. An expansion program has been undertaken by several companies, but the necessity for concentration of available machine tools on the ship, tank, and bomber programs will delay completion of additional facilities for compressors.

The order, L-100, prohibits the placing or acceptance of orders for compressors covered by the regulations unless specific authorization is made on Form PD-420. Application for authorization to place orders must be made on Form PD-415. Manufacturers with whom orders authorized by the Director of Industry Operations are placed must accept such orders. Regardless of prior commitment or preference rating, manufacturers may deliver compressors only in accordance with a set procedure. This involves a filing by the manufacturer of a statement showing compressors available for distribution, a list of all orders, and an application on form PD-416 for permission to make delivery. Such application must be made on or before the 25th day of each month

As defined by the order, heavy compressors are classed as "critical compressors". This means "any crank and flywheel type horizontal reciprocating compressor or dry vacuum pump having a displacement of 50 cubic feet per minute or more, or any other reciprocating compressor having a displacement of 300 cubic feet per minute or more, and includes new, second-hand, and reconditioned equipment".

Explosives. Use of a higher preference rating to obtain explosives and explosive equipment is granted to mining enterprises operating under Preference Rating Order P-56 by Amendment 5. Under the order as originally issued a preference rating of A-8 was assigned to deliveries of operating supplies, including explosives. Amendment 5, which adds explosives and explosive equipment to the types of machinery and supplies listed in Schedule A of the order, will allow mining enterprises to use a rating of A-1-c to obtain them, subject to quota restrictions.

Machinery. Restrictions on production of critical industrial machinery listed in Limitation Order L-83 will go into effect May 15. Effective date of the order, originally April 9, was postponed to avoid disruption of schedules in plants preparing to convert to output of war supplies. Provisions of L-83 already in force, however, make it unlawful for manufacturers or distributors to accept orders for such equipment or to make deliveries without WPB approval. Amendment 1 will permit manufacturers to continue production on orders that were on their books before L-83 became effective. There is no guarantee, however, that machinery produced on unapproved orders will be permitted to be delivered to the person or persons from whom the orders were received. Before deliveries will be permitted, WPB must be advised of the type of equipment involved and the use for which it is intended.

Priority Assistance. All applications for priority assistance which do not specify a required delivery date will hereafter be returned to the applicant by the War Production Board. Priorities Regulation 1 as amended requires every applicant for priority assistance to specify the latest date on which the items in connection with which priority assistance is requested can be delivered to him to meet his contract obligations or production schedules. Many applicants, especially those submitting individual applications on PD-1A forms, have been specifying "immediately" or "at once" instead of filling in a definite

delivery date. Hereafter, no such applications will be considered until an exact delivery date has been filled in.

Priority Diversion. Black market operations in scarce chemicals, which had resulted in profits of more than 100 per cent to two New York firms, backfired when on April 23 WPB announced suspension orders directed against the Acme Chemical Co., Inc., Rona Chemicals, and Hans Lowey and Leroy G. Cohen, principals in the illegal transactions.

The orders state that priority orders were violated. Order S-41, directed against Acme, provides that for a period of six months no preference ratings shall be assigned to delivery of any material to the offending company and that no allocation of any material restricted by the WPB shall be made to it. S-42 is directed against Hans Lowey and Leroy G. Cohen, individually or doing business as Rona Chemicals, and imposes the same penalties meted out to Acme. Since many medicinal chemicals are difficult if not impossible to obtain without preference ratings, the punitive action in these cases is severe.

Resins. Natural resins, which have been substituted in civilian use for the synthetic resins needed for war purposes, have also become scarce. Unfortunately, natural resins come only from such widely separated parts of the world as New Zealand, the Philippines, Batavia, Singapore, the East Indies, India, and Africa. With war demands growing for both plastics and paints and limited supplies of natural resins being received, curtailment of civilian use of natural resins is necessary.

This is accomplished by Conservation Order M-56 which, in the main, restricts the use of natural resins in any calendar quarter to 50 per cent of the amount used in the corresponding quarter of 1941. In manufacture of rotogravure inks the restriction is to 75 per cent of the amount used in the corresponding period. Form PD-339 is provided for quarterly inventory reports. Use of natural resins in barn paint, farm equipment finishes, floor finishes, freight car paints, interior house paints, pencil finishes, playing card finishes, porch and deck paints, road marking paints, spirit label varnishes, and toy and novelty finishes is prohibited entirely. Asphaltic and pitch bases can be used for some of these products, and pine rosin is adaptable to others. For the slick varnish finish on pencils and playing cards, no substitute is known.

The restrictions do not apply to Army, Navy, or Lend-Lease contracts, nor to use as a noncorrosive finish in chemical plants, in research laboratories, in vessels other than pleasure craft, or in health supplies. The order applies to the manufacture of products containing natural resins and does not restrict the sale of paints or varnishes already manufactured.

Rotenone. Because imports of rotenone from Malaya and the Netherlands Indies have been cut off, limitations on its use are ordered in Conservation Order M-133. M-133 permits continued use as a delousing agent and for food crops other than cotton, tobacco, cranberries, eggplant, cucurbits, onions, peppers, and sweet corn. Household uses are prohibited. The order applies to manufacture of preparations containing rotenone and does not affect the use of such products already manufactured. Rotenone imports from Latin America, normally half the United States supply, are expected to increase sharply next year. Shipments of pyrethrum, a satisfactory substitute for household uses, continue to arrive from Africa and are not restricted.

Shellac. Order M-106 freezes 50 per cent of all inventories of shellac of 10,000 pounds or more and 50 per cent of all future imports. Output of phonograph records and radio transcriptions is reduced to approximately 30 per cent of 1941 production by limiting the amount of shellac available to that amount. Other uses are restricted to 75 per cent of the corresponding period of 1941 until June 30 and 35 per cent by quarters thereafter. Uses excepted from the restrictions are electrical equipment, coatings for munitions, military explosives and pyrotechnics, navigational and scientific instruments, communication instruments, marine paints for vessels other than pleasure craft, grinding wheels, wood patterns for metal castings, health supplies as defined in P-29, and in scientific research.

Price Regulation

Fats and Oils. Labeling persistent reports of a forthcoming increase in present fats and oil ceiling prices as "utterly without foundation", Price Administrator Leon Henderson has charged that rumors of this nature have inspired a withholding movement of substantial cottonseed oil, soybean oil, and tallow supplies from the market to the detriment of industry and the entire war effort.

At the same time, Mr. Henderson said that Amendment 3 to Revised Price Schedule 53 will be issued shortly by OPA. Purpose of this new amendment will be to set specific prices for some 125 varieties of fats and oils at certain basing points over the country. These prices, it is emphasized, generally will spell out specifically the same prevailing ceilings under which the industry now is operating. The present maximums are the individual seller's highest prices as of October 1, 1941, or 111 per cent of the price at which transactions were made on November 26, 1941. The new price basis will be a uniform one for the entire industry, with differentials for various basing points.

Glycerol. Harshaw Chemical Co., Cleveland, has been authorized to sell to the Treasury Procurement Division approximately 45 tons of dynamite glycerol at a price reflecting only cost but nevertheless exceeding the maximum prices set by OPA Revised Price Schedule 38. The glycerol in question was refined from crude glycerol purchased in South America before OPA imposed ceiling prices. The contract price exceeded the maximums thereafter set by OPA. Because of transportation difficulties the crude product was not delivered to Harshaw until recently.

Paints. Heeding the danger of threatened serious price advances by producers of oil paints and varnishes, OPA has fixed temporary maximum prices at levels which prevailed on April 12, 1942. Effective April 22, the action is embodied in Temporary Price Regulation 19. The new regulation will remain in force for 60 days, during which time OPA will continue its investigation of the pressures on paint prices.

The temporary regulation covers manufacturers' prices on all paints and varnishes in which linseed oil, or any other drying oil, is a component part, and includes house paint, wall paint, interior flat paint, enamels, lacquer enamel, undercoats, floor and deck paint, barn and roof paint, colors in oil, shingle stain, oil stain, fillers, and varnish.

The order provides that the cost to a purchaser of oil paint or varnish from a manufacturer shall not exceed the prices the purchaser paid or would have paid on April 12 and keeps in force all discounts, charges, deposits, allowances, and freight and delivery practices then recognized by the manufacturer.

Nelson Asks for More Subcontracting

INCREASED subcontracting may swing the balance in this war, Donald M. Nelson, chairman of the War Production Board, said recently in an open letter to major prime contractors. Production speed is the dominant factor in the race with the Axis, Mr. Nelson asserted, and we have no time to wait for new tools and new plant facilities. Every available idle tool that can be put to work must be put to work. This may cost more, he added, but the job must be done fast and experience has shown that some prime contracts can be subcontracted as much as 90 per cent. Every prime contractor should consider having an established subcontracting department. Subcontractors should be given engineering assistance. Plants with as few as five or six machines can and should be used in subcontracting.

The War Production Board, Mr. Nelson pointed out, has established field offices throughout the United States, now grouped in 13 regions. To effect the fullest and most efficient utilization of facilities within their areas they maintain

records of machine tool equipment and other facilities of manufacturing establishments. He urged all contractors to make subcontracting needs known to the nearest office.

Hearing Scheduled on Standard for Canned Peas

A PUBLIC hearing will be held May 25 to consider a proposal to amend the identity standard for canned peas, published in the *Federal Register* of February 24, 1940, and effective since May 24 of that year. The hearing will commence at 10:00 A. M., in room 1039, South Building, Independence Avenue between 12th and 14th Streets, S. W., Washington, D. C.

Proposals of the pea-canning industry under consideration are that the standard be amended to provide for addition of inorganic calcium, sodium, and magnesium compounds as optional ingredients for the purpose of retaining color, with such substances designated as optional ingredients and named on the label.

Details are published in the *Federal Register* of April 25. Copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 10 cents each.

Magnesium Companies Fined

FINES totaling $140,000 have been imposed upon five corporations and six individuals who pleaded *nolo contendere* to an indictment charging violation of the antitrust laws in the production and fabrication of magnesium, the U. S. Department of Justice has announced. At the same time, the entry of a consent decree was entered providing for compulsory free licensing of patents held by the defendants for the production and fabrication of magnesium.

Defendants fined were Aluminum Co. of America, $25,000; Dow Chemical Co., $25,000; American Magnesium Corp., $25,000; Magnesium Development Corp., $20,000; General Aniline and Film Corp., $15,000; Arthur V. Davis, chairman of Alcoa, $5,000; Roy A. Hunt, vice president of Alcoa and president of American, $5,000; Irving W. Wilson, vice president of Alcoa, $5,000; Willard H. Dow, president, and Earl W. Bennett, vice president of Dow, $5,000 each; and Karl Hochschwender, president of Magnesium Development, $5,000.

Judge Goddard remitted the fine against Hochschwender.

Government Takes Foreign-Owned Schering Stock

LEO T. CROWLEY, Alien Property Custodian, has completed Americanization of the Schering Corp., Bloomfield, N. J., by taking over in the name of the U. S. Government 100 per cent of the corporation's common stock, heretofore held by foreign nationals. The company itself began eliminating alien influences in its management some months ago.

Schering manufactures drugs and biologicals of vital importance to the public health and to medical branches of the armed forces. Its manufacturing facilities are being expanded to permit wider distribution of its products, and representatives of the Alien Property Custodian are stationed at Schering Corp. to supervise operations.

PRODUCTION of linseed oil and the crush of flaxseed during the first quarter of 1942 was the largest recorded since the beginning of the quarterly collection of these statistics in 1919, according to a preliminary report released by the U. S. Bureau of the Census.

Second Report of Scarcity of Materials Issued

THE second in the series of provisional reports on the relative scarcity of certain materials, prepared by the Conservation and Substitution Branch of the Bureau of Industrial Conservation, WPB, shows inclusion of many more items.

The following table lists the materials, new to the ranks of those short in supply, as well as indicating the changed status of some given in the previous report (CHEMICAL AND ENGINEERING NEWS, March 25, page 375). The words in parentheses show the ranking of the materials as they were listed in the first report and indicate whether the supply situation has relaxed or tightened. Materials in the previous report which have not changed in relation to supply and demand, according to WPB, are not again listed here.

Group I. Materials most vitally needed for war purposes, not generally available for civilian needs

- Acetone (from Group II)
- Ammonia, anhydrous (from Group II)
- Anthraquinone derivatives
- Cotton duck
- Feathers and down, goose and duck
- Kyanite
- Methyl methacrylate sheets
- Mica splittings (from Group II)
- Nickel scrap
- Nylon
- Palm oil (from Group II)
- Phosphates
  - Tricresyl
  - Triphenyl
- Phthalic anhydrides and phthalates
- Polystyrene
- Quartz crystals (from Group II)
- Quinine (from Group II)
- Rapeseed oil (from Group II)
- Rhodium (from Group II)
- Shellacs (from Group II)
- Teak (from Group II)
- Zinc, high grade (from Group II)

Group II. Basic materials that are essential to the war industries but whose supply is not so critically limited as materials of Group I

- Albumin, blood
- Alcohol
  - Butyl
  - Ethyl
- Benzene
- Cotton, raw, long staple
- Cottonseed
- Ferrosilicon
- Glues, animal and vegetable
- Glycols
- Henequen
- Iron
  - Pig
  - Scrap
- Lead (from Group I)
- Lithium
- Methyl methacrylate powder
- Ruthenium (from Group III)
- Silicon and alloys (from Group III)
- Steatite talc
- Vulcanized fiber
- Wood pulp
- Xylene
- Zinc, low grades
- Zirconium

Group III. Materials available in significant quantities for other than strictly war purposes. Use, however, may be restricted by manufacturing limitations. Restrictions are commonly imposed but supplies are not critically short, except in the case of iron and steel

- Atebrin
- Carbon black
- Casein (from Group II)
- Charcoal
- Coal-tar pitch
- Diatomite
- Emery
- Fluorspar
- Gilsonite
- Hydrochloric acid
- Indium
- Invert sugar
- Iodine (from Group II)
- Lime
- Linseed oil (from Group II)
- Mica, common
- Osmium
- Pottery
- Silica sand
- Sodium metasilicate
- Sodium nitrate, commercial
- Starch
- Steel, open hearth
- Straw
- Sugar (from Group II)
- Tripoli
- Vermiculite

Riboflavin Requirement Postponed

EFFECTIVE date of the requirement that 1.2 mg. of riboflavin be an ingredient of enriched flour, enriched bromated flour, enriched self-rising flour, and enriched farina has been postponed to April 20, 1943, the FSA announces. The supply of riboflavin, it is explained, will not be sufficient by July 1, 1942, the former effective date, to permit production of the foods on a scale to meet current demands, but should be adequate by April 20, 1943.

The order is published in the *Federal Register* of April 25. Copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 10 cents each.

Bass to Head New England Industrial Research Foundation

Lawrence W. Bass

LAWRENCE W. BASS, chemical engineer and research management specialist, has been appointed director of the newly established New England Industrial Research Foundation, Inc., 137 Newbury St., Boston, Mass. Dr. Bass has been assistant director of the Mellon Institute of Industrial Research, Pittsburgh, since 1937 and previously was a member of the executive staff from 1929 to 1931.

The New England Industrial Research Foundation, organized under the sponsorship of the New England Council, is the outgrowth of a two-year study made by the council's New Products Committee headed by Karl T. Compton, president of Massachusetts Institute of Technology. The foundation is broadly interested in the maintenance and further expansion of industrial New England and the more intensive development of its resources, as well as with the opportunity afforded by existing research and engineering facilities for the advancement of established industrial enterprises.

Officers of the New England Research Foundation are: president, Earl P. Stevenson, president, Arthur D. Little, Inc., Cambridge, Mass.; treasurer, Harold B. Richmond, treasurer, General Radio Co., Cambridge; director, Lawrence W. Bass; assistant director and secretary, Richard B. Cross, former secretary of the New Products Committee, New England Council.

Trustees of the foundation are: Ralph E. Flanders, president, New England Council, and president, Jones and Lamson Machine Co., Springfield, Vt.; Earl P. Stevenson; A. E. Marshall, president, Rumford Chemical Works, Rumford, R. I.; Karl T. Compton; Harold B. Richmond; Harold Ladd Smith, director of research, Vermont Marble Co., Proctor, Vt.; and Richard B. Cross.

Frank R. Mayo, instructor in organic chemistry at the University of Chicago, has resigned to take a position as research chemist with the U. S. Rubber Co. at Passaic, N. J.

Women Wanted for War Work

WOMEN have their part in the war program, and it is an important part. They are urgently needed for a wide scope of scientific and technical work in government positions in Washington, D. C., and in the ordnance laboratories and arsenals throughout the country.

In the fields of chemistry and physics, the greatest need for women at this time is for those qualified for positions of assistant technical and scientific aid, $1,620 a year; junior physicist, $2,000; and junior chemist, $2,000. Opportunities, however, are not limited to these positions, but women who can qualify are also needed for the higher grades.

The United States Civil Service Commission urges women to apply who have successfully completed at least one year of college training, including laboratory courses in physics or chemistry. Applications should be filed under one or more of the announcements for the following positions depending on the nature and extent of applicant's education or experience or both: technical and scientific aid (various grades) $1,440 to $2,000 a year; junior physicist, $2,000; junior chemist $2,000; research chemist and analytical chemist (various grades), $2,600 to $5,600; physicist (various grades), $2,600 to $5,600 a year.

Announcements giving further details and application forms may be obtained at any first- or second-class post office or from the U. S. Civil Service Commission, Washington, D. C.

Chemist Graduates of Smith College

THE students of Smith College, Northampton, Mass., listed below will receive their A.M. degrees in June and will be located as follows:

Rosa F. E. Kohls, Celanese Corp., Cumberland, Md.

Mary E. Sanguineti, Ridbo Laboratories, Inc., Paterson, N. J.

Margaret E. Wyatte, Women's College, University of North Carolina, Greensboro, N. C.

The following will receive the A.B. degree in June:

Clara H. Gebhard, Eastman Kodak Co., Rochester, N. Y.

Ellen Y. Saville, Texas Co., Beacon, N. Y.

Josephine van der Voort, Armstrong Cork Co., Lancaster, Penna.

Richard W. Schayer has left the Fish and Wildlife Service, College Park, Md., to accept a position as assistant chemist with the U. S. Public Health Service, Industrial Hygiene Section, Missouri State Board of Health, Jefferson City.

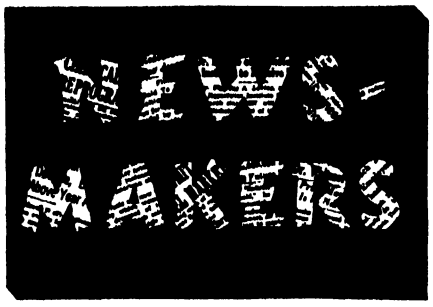
Mellon Institute Does Aeronautical Research for Navy

THE Navy Department recently established a basic research project on problems relating to the operation of specialized aviation instruments at the Mellon Institute of Industrial Research, University of Pittsburgh, Pittsburgh, Penna.

The scientifically trained personnel working on this project in behalf of the Bureau of Aeronautics includes the following members of the Mellon Institute: George E. Barker, senior industrial fellow, George E. Alter, industrial fellow, and Charles E. McKnight, fellowship assistant. Other specialists will be added as the research progresses.

A broad survey of the problems involved is being made by Dr. Barker with the cooperation of the Navy Department, various American instrument manufacturers, and other federal government laboratories.

Kober Foundation Honors Awarded



SCIENTIFIC honors of Georgetown University's Kober Foundation have been awarded to Donald Dexter Van Slyke, discoverer of the new amino acid, hydroxylysine, and holder of the Willard Gibbs Medal, and Charles Armstrong, chief of the Division of Infectious Diseases, United States Public Health Service.

The 1942 Kober medal went to Dr. Van Slyke at the annual meeting of the Association of American Physicians in Atlantic City on May 5 for "distinguished research in preventive medicine". Dr. Van Slyke has been associated with the Rockefeller Institute for Medical Research continuously since 1907 and chemist of its hospital since 1914.

Dr. Armstrong, designated to be the lecturer, an appointment which carries a $500 honorarium, spoke on "Recent Developments in Neurotropic Virus Diseases" May 5 in Gaston Hall at the university. He has been associated with the National Institute of Health since 1921 and with the Public Health Service since 1916.

The Kober Foundation was endowed by the late George Martin Kober. As dean of the Georgetown medical school, Dr. Kober provided that recipients of the annual honors be chosen alternately by the Medical Society of the District of Columbia, Association of Military Surgeons of the United States, and Association of American Physicians. Dr. Van Slyke was selected by the Association of American Physicians; Dr. Armstrong by the Association of Military Surgeons.

Cecil Carr, a recent graduate of Iowa State College, has been added to the research staff of the Commercial Solvents Corp., Terre Haute, Ind.

Robert O. Alexander, for three years development and control chemist in the laboratories of the U. S. Rubber Co., Providence, R. I., has accepted a position as development chemist in the laboratories of the Thiokol Corp., Trenton, N. J.

J. G. Baragwanath, American mining engineer long active in Latin American mining developments, has been placed in charge in Cuba of the Nicaro Nickel Co.'s project to develop Cuban nickel ores, and will have headquarters in Havana. The Reconstruction Finance Corp. has made available $20,000,000 for construction of a nickel-recovery plant and facilities for treating low-grade ores on the eastern end of Cuba.

R. I. Bashford is now located in Paducah, Ky., in defense work for the Government.

Norman Baughn, for 12 years connected with the Cook Paint & Varnish Co., has joined the staff of the American-Marietta Co., Chicago, Ill., as a technical specialist in Army and Navy Ordnance and Quartermaster Corps paints.

Marston T. Bogert, professor emeritus of organic chemistry at Columbia University, has been elected an honorary life member of the Council of the Society of Chemical Industry. Dr. Bogert was president of the society in 1912–13. At the recent annual meeting of the Supervisory Board of the American Year Book, Dr. Bogert, representative of the AMERICAN CHEMICAL SOCIETY, was elected to the presidency.

On June 30 **G. Lee Camp** will retire as vice president, member of the board of directors, and co-general manager of the Organic Chemicals Division, Monsanto Chemical Co., St. Louis, Mo. Mr. Camp joined the organization 12 years ago, as assistant to the president and will retire immediately after his 60th birthday. He has been active in the chemical industry for 41 years.

Clayton C. Carroll is now production control and research chemist with the United States Radium Corp., New York, N. Y. He was formerly junior chemist with the U. S. Bureau of Animal Industry, stationed in the meat-inspection laboratory at St. Louis, Mo.

Charles H. Currier has been elected president of the Tubular Exchanger Manufacturers' Association. Mr. Currier is vice president and general manager of the Ross Heater and Mfg. Co., a division of the American Radiator and Standard Sanitary Corp., Buffalo, N. Y.

Willard A. Doehnert, Pennsylvania State College 1940 and formerly with Eastern States Manufacturing Co., has joined the research staff of the Central Soya Co., Decatur, Ind.

Harold R. Murdock has been made vice president and general manager of the Hamilton Laboratories, an associate company of the Champion Paper and Fibre Co., manufacturing phenylmercuric compounds at Hamilton, Ohio.

Carl A. Ostling has resigned his position as production vice president of the Carrier Corp., Syracuse, N. Y., to become director of industrial engineering for the U. S. Rubber Co., where he will act as assistant to the president on matters relating to conversion of company properties to war work. **John H. Holton** will become works manager of Carrier, with the title of vice president, and will have as assistants **R. N. Campbell** and **Earle D. Williams. F. F. Hoyt** has been elected vice president.

Robert M. Salter, since October 1941 head of the Division of Soil and Fertilizer Investigations, U. S. Department of Agriculture, Washington, D. C., has been appointed chief of the Bureau of Plant Industry, succeeding E. C. Auchter, recently appointed administrator of the Agricultural Research Administration. **R. O. E. Davis** has been designated acting head of the Division of Soil and Fertilizer Investigations.

Frank J. Tone retired on April 22 as president of the Carborundum Co., Niagara Falls, N. Y., with which he had been associated since 1895. He has been appointed chairman of the board of directors, and **Arthur A. Batts,** formerly secretary, has become president.

Wilfred H. White, formerly with the Jamestown Malleable Iron Corp., has accepted a position with the War Production Board, Tungsten Division, Washington, D. C.

J. T. Baker Fellowship Award

THE 1942–43 J. T. Baker Chemical Co. Research Fellowship in Analytical Chemistry (Eastern Division) has been awarded to A. Letcher Jones. Mr. Jones will work under John H. Yoe at the University of Virginia. The committee making the award was composed of: N. H. Furman, chairman, Princeton University; J. H. Yoe, secretary, University of Virginia; G. P. Baxter, Harvard University; H. A. Fales, Columbia University; and C. W. Mason, Cornell University.

M. I. T. Gives Public Health Training

THE Department of Public Health at Massachusetts Institute of Technology is offering an accelerated program of public health training beginning June 8 and allowing for the completion of a master's degree on February 6. These training programs are organized for public health engineers, health educators, and public health laboratorians, as well as for administrators. Special summer courses are also being offered. Further information may be obtained from the Department of Health, M. I. T., Cambridge, Mass.

Scientific Medals Awarded

THE coveted Franklin Medal of the Franklin Institute was awarded April 15 to Jerome Clarke Hunsaker, general coordinator of the Naval Research and Development Board and chairman of the National Advisory Committee for Aeronautics, and Paul Dyer Merica, vice president of the International Nickel Co. of Canada. War industries are now finding wide use for Dr. Merica's discoveries in the use of a variety of alloys for commercial purpose and are applying the principle of precipitation hardening developed by him. Dr. Hunsaker, designer of the *Shenandoah,* first large airship to be built in the United States and the NC type of flying boat which made aviation history on its transatlantic flight in 1919, is guiding research aimed at giving America the best equipped flying forces in the world.

Elliott Cresson medals have been awarded to Claude S. Hudson, National Institute of Health, for studies of the chemistry of sugars, and to Isidor I. Rabi, Columbia University, for making possible the exploration of secrets of the atom by his magnetic resonance method.

A Howard N. Potts medal goes to Jesse W. Beams, University of Virginia, for his ultra-high speed centrifuges.

NECROLOGY

Loy B. Cross

LOY B. CROSS, of Emory University, died April 22 in Memphis, while attending the 103rd meeting of the AMERICAN CHEMICAL SOCIETY there. He was 32 years old.

Dr. Cross was born at Lubbock, Tex., was graduated from Texas Tech, and received his M.A. from Yale and his Ph.D. from the University of Texas. He was assistant instructor in chemistry at Emory University.

Eugene Fitzpatrick

EUGENE FITZPATRICK, chief chemist of Phelps Dodge Refining Corp., Long Island City, died recently. He was 65 years old. Mr. Fitzpatrick was the holder of patents on numerous processes for the manufacture and refining of copper. He was a member of the American Institute of Mining and Metallurgical Engineers.

R. S. Fleming

R. S. FLEMING, director of research of the Borden Co., Syracuse, N. Y., died suddenly on April 18, 1942, at the age of 65.

Mr. Fleming was born near Owen Sound, Ontario, Canada, and received his A.B. degree from the University of Toronto in 1904. From 1904 to 1909 he was chemist for the Canadian Milk Products Co. of Toronto. From 1909 to 1928 he was chief chemist in charge of research and control for the Merrell-Soule Co., Syracuse, and when that company was combined with the Borden Co. he continued as director of research. His work was concerned chiefly with the drying of milk and other food products. He was granted several patents on the drying of fruit juices.

He was a member of The Chemists' Club (New York City), American Dairy Science Association, and Institute of Food Technologists, a fellow of the American Association for the Advancement of Science, and had belonged to the AMERICAN CHEMICAL SOCIETY since 1907.

From 1918–20 he was Chairman of the Syracuse Section of the AMERICAN CHEMICAL SOCIETY and from 1922–26 he served as Councilor.

Walter S. Frisbie

WALTER S. FRISBIE, chief of the Division of State Cooperation, Food and Drug Administration, died February 19 in Washington, D. C. He was 60 years old.

Mr. Frisbie was born in New Haven, Conn., and graduated in 1901 from Yale University with a Ph.B. degree. From 1901 to 1903 he studied medicine at Cornell Medical College and Johns Hopkins University Medical School. He was associated with the New York State Pathological Laboratory, Colgate & Co., and Parke, Davis & Co. before going with the Dairy and Food Commission in Des Moines, Iowa, as assistant chemist in 1907. Seven years later he became state chemist with the State Food, Drug, Dairy, and Oil Commission, Lincoln, Nebr. In 1919 Mr. Frisbie was appointed chief of the Bureau of Food, Drugs, and Oil, Nebraska State Department of Agriculture. Two years later he accepted the position he held until his death.

Mr. Frisbie was a member of the Joint Committee on Definitions and Standards and in 1927 was elected chairman of the committee, which has been known recently as the Food Standards Committee.

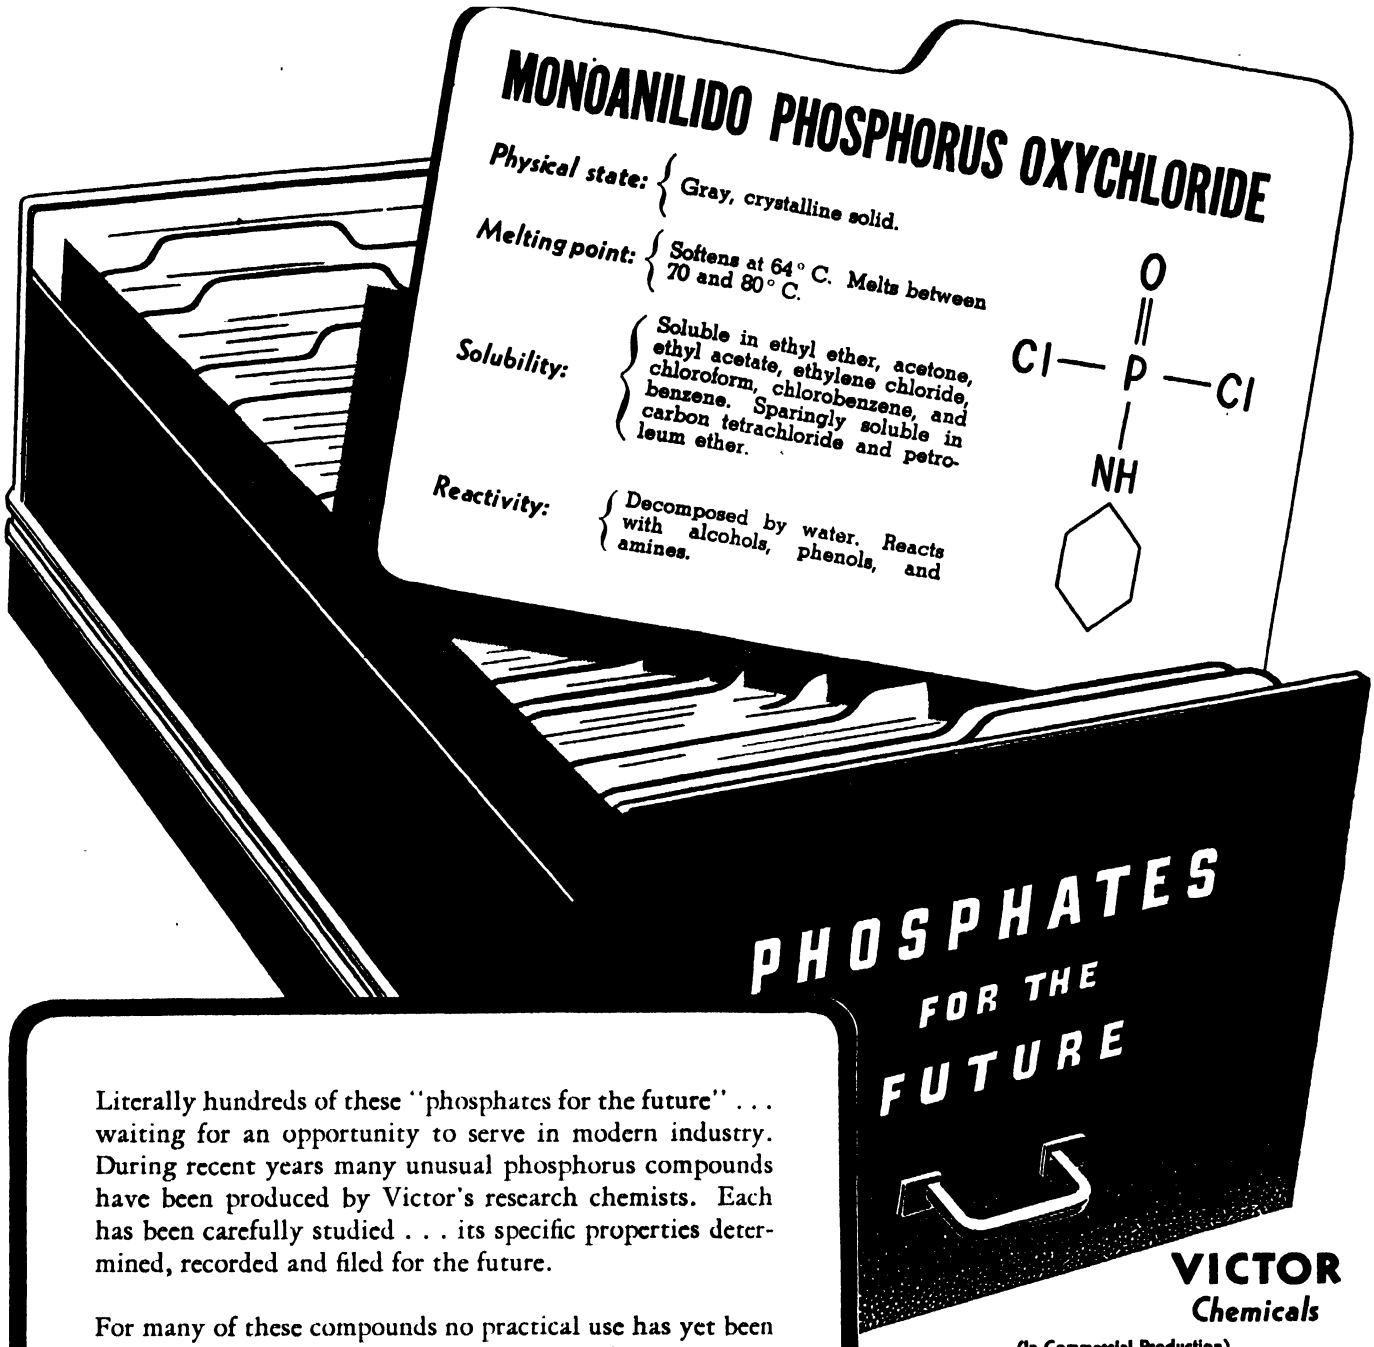
He had belonged to the AMERICAN CHEMICAL SOCIETY since 1924. In 1925 Mr. Frisbie joined the American Public Health Association, of which he became a fellow in 1930. He was identified with its Food and Nutrition Section, serving as vice chairman in 1936 and chairman in 1937. For many years he was a member of the association's Committee on Research and Standards. Mr. Frisbie had been identified with the Association of Official Agricultural Chemists since 1920. In 1929 he was appointed to the board of editors of its journal and was chairman of the committee and editor of the journal in 1932, the same year in which he was one of the incorporators of the association. At the 1934 meeting he was appointed to the executive committee, in 1938 he became vice president, and in 1939 president.

Other organizations in which Mr. Frisbie actively participated were the Association of Food and Drug Officials of the United States, Association of American Feed Control Officials, and National Conference on Weights and Measures.

Insect Extinguisher Patented

BY USING a liquified gas as a "carrier" of poison spray material, U. S. Department of Agriculture entomologists find it possible to divide the poison into much smaller particles than with liquid sprays. Since the poison particles stay longer in the air and do not settle so quickly, there is a gain in effectiveness against flying pests.

This is the secret of the aerosol method on which the department's entomologists have devised and patented for public use a new improvement. The first aerosol experiments involved spraying a volatile liquid on a hot plate. The poison was dissolved in the liquid and carried into the air on the gas that formed. The improvement comes from using one of several chemicals that are gases at ordinary temperatures and are liquids only when under pressure.



By loading a cylinder with a minute dose of such a poison as nicotine, pyrethrum extract, or rotenone and filling the cylinder with the liquified gas under pressure, the scientists have devised equipment resembling a common type of fire extinguisher that will spray out the liquified gas under its own pressure.

Patents on Wrinkle Finish Upheld

ON MARCH 26 the United States Court at Buffalo, N. Y., rendered a decision in the case of New Wrinkle, Inc., Dayton, Ohio, owner of patents on wrinkle finishes upholding the validity and infringement of these basic patents. The case was defended by the Pontiac Varnish Co., Pontiac, Mich., a manufacturer of varnishes and enamels.

The Court found that wrinkle finishes were broadly new as covered by the patents in suit. These patents are licensed to 160 leading paint manufacturers of the United States and also to manufacturers in England and other foreign countries.

New Wrinkle, Inc., maintains an extensive research laboratory at Dayton, Ohio, where it conducts research in the development of new types of wrinkle finish for industrial use. Wrinkle finishes are used almost universally on business machines such as cash registers, typewriters, adding machines and on industrial products such as instruments, machine tools, heaters, motors, sewing machines.

Literally hundreds of these "phosphates for the future" . . . waiting for an opportunity to serve in modern industry. During recent years many unusual phosphorus compounds have been produced by Victor's research chemists. Each has been carefully studied . . . its specific properties determined, recorded and filed for the future.

For many of these compounds no practical use has yet been found . . . but the same could have been said not long ago about others which today are indispensable. Perhaps one of these obscure phosphorus compounds may solve a difficult problem for you. Our research staff will gladly cooperate with you.

For years Victor has specialized in phosphates, formates and oxalates . . . today is the world's leading producer of these compounds.

International Meeting of Rubber Chemists

THE annual international meeting of the Buffalo Group, Division of Rubber Chemistry, AMERICAN CHEMICAL SOCIETY, the Canadian Rubber Group of the Canadian Chemical Association, and the Quebec Rubber and Plastics Group was held in the General Brock Hotel, Niagara Falls, Canada, on April 30.

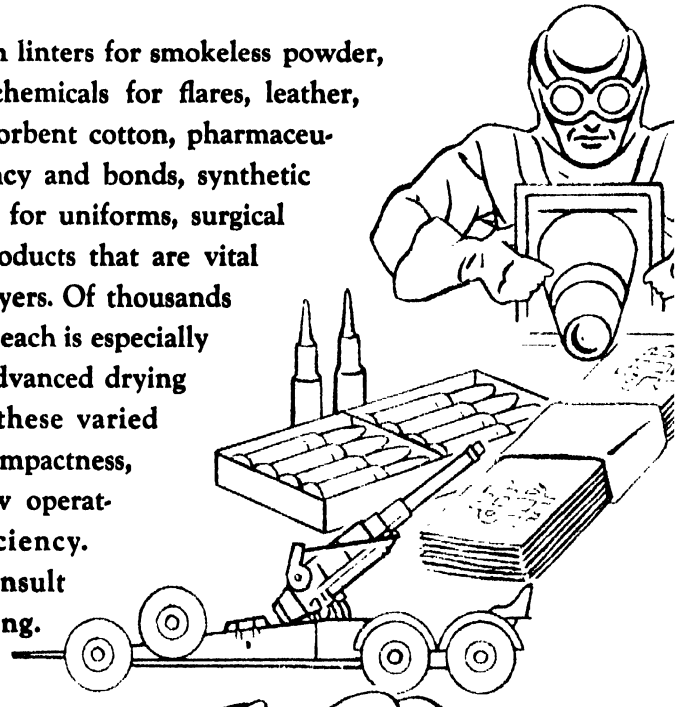
E. G. Holt, chief, Rubber Staff, U. S. Department of Commerce, and Arthur W. Carpenter, Bureau of Industrial Conservation, War Production Board, were the speakers.

Nutrition Institute Chooses Officers

AT THE meeting of the American Institute of Nutrition in Boston, April 1, L. A. Maynard was elected president for the coming year. Other officers are vice president, H. B. Lewis; secretary, A. H. Smith; treasurer, W. H. Sebrell, Jr.; and councilor, T. H. Jukes.

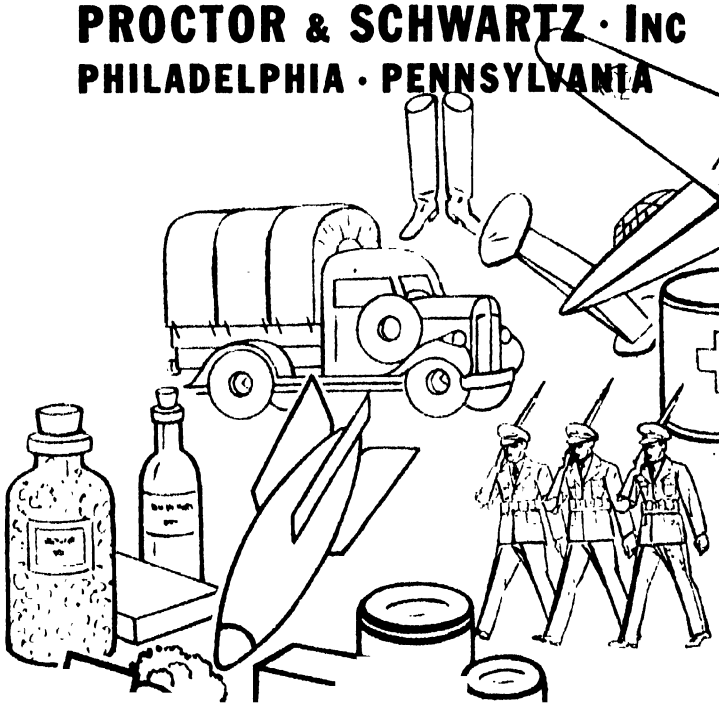
Quebec Rubber and Plastics Group Meetings

THE April meeting of the Quebec Rubber and Plastics Group was held April 10 in the Chemistry Building of McGill University, Montreal. More than 60 members were fortunate in hearing J. M. Ball speak on the timely subject, "Synthetic Rubber Compounds".

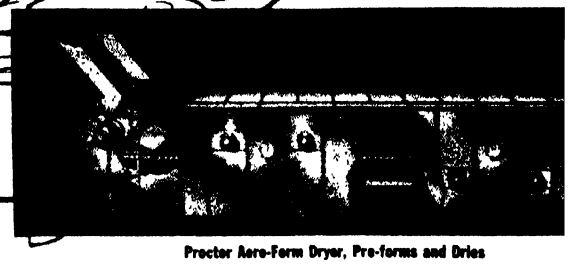


Mr. Ball, editor of *Vanderbilt News* and author of many articles on rubber compounding and research, has been connected with the R. T. Vanderbilt Co. for many years, and has recently been appointed rubber consultant of the WPB in Washington. Since his engagement to speak to the group was made before his appointment, he spoke as a Vanderbilt representative. Some of the milling, plasticizing, and compounding properties of seven different synthetics were discussed, slides and samples being used. Rebound tests were conducted on several synthetic compounds at room and elevated temperatures to illustrate differences in resilience between the synthetics at various temperatures.

An additional plastics meeting was held May 8 with A. E. Byrn, Canadian General Electric Co., as speaker. He discussed plastics in general and the Glyptal resins in particular.



Drying



DRIES THOUSANDS OF DIFFERENT PRODUCTS THAT ENTER INTO THE PRODUCTION OF WAR MATERIALS

Motion picture films for sea plane tenders, cotton linters for smokeless powder, veneer for airplanes, tracer bullet mixtures, chemicals for flares, leather, textiles, chemicals, cartridge cases and shells, absorbent cotton, pharmaceuticals, tetryl for bombs, gun wads, paper currency and bonds, synthetic rubber, foodstuffs, primer parts, dyestuffs, wool for uniforms, surgical gauze, and many, many other widely varied products that are vital to the war effort are being dried on Proctor Dryers. Of thousands of Proctor Dryers now in use—each is different—each is especially designed to do a particular job the best that advanced drying knowledge says the job can be done. Yet all these varied machines have certain things in common . . . compactness, sturdy construction, freedom from trouble, low operating and upkeep costs, and all-around efficiency. Which are essentials in today's scheme. Consult Proctor & Schwartz if it's a matter of drying.

Seattle Convention of A. I. Ch. E. Students

THE University of Washington student chapter was host to the Northwest annual convention of the American Institute of Chemical Engineers at Seattle, Wash., April 17 and 18, 1942.

Following registration W. L. Beuschlein, Chemical Engineering Department, gave a welcoming address. Edwin Korpi, University of Washington, opened the series of technical discussions with a talk on "Reactions of Ethylene Diamine". Harold Frisbie, Oregon State College, followed with the "Cost Involved in Pressure Vessel Design", deriving a series of formulas for the most economical designs. A description of the apparatus used for the determination of the "Viscosity of Propane Oil Mixtures at Low Temperatures" was presented by James Mitchell from Washington. In the afternoon Joseph McCarthy outlined the "Chemical Utilization of Wood".

Donald Meyers, University of Washington, opened Saturday's session with a discussion of the "Theory of Wood Coke Production from Wood Waste". Lyle Pollock concluded the technical talks with a description of "Building a Pilot Plant for Production of Wood Coke".

Inspection of the modern chemical engineering laboratories was conducted by H. K. Benson, head of the Department of Chemistry and Chemical Engineering.

At the formal banquet Saturday evening A. L. Williams, assistant to the president of Puget Sound Power and Light, gave an inspiring talk entitled "Preparing Yourself for Management".

Assisting Jack Newman, local chapter president, and Glendon Andrews, conclave chairman, were Arvid Anderson, Don Chaffee, Frank DeVry, Dick Graham, Chris Gregores, Jim Hamilton, Verne Loop, Jim Mitchell, Wesley Pearl, Rolvin Petrie, Bob Shervem, and Sam Yankelowitz. Schools represented were Oregon State College, Washington State College, and the University of Washington.

Electrochemists Hold 81st Annual Meeting

EDWARD MYRON BAKER was elected president of the Electrochemical Society at the recent 81st annual meeting in Nashville, Tenn. R. M. Burns, Bell Telephone Laboratories, was re-elected treasurer and Colin G. Fink, Columbia University, was re-elected secretary.

The $1,000 Weston Fellowship Award, made to the most deserving young student, was presented to William E. Roake, graduate student of Oregon State College, at the annual dinner. The Young Author's Prize for the best electrochemical paper published during the past year went to Edward Adler, Department of Chemistry, College of the City of New York.

Conference on the Physics of Pigments and Glasses

SEVEN prominent authors will present technical papers in a Conference on the Physics of Pigments and Glasses, May 15 and 16, 1942, at Houston Hall, University of Pennsylvania, Philadelphia. The conference is being sponsored by the Department of Physics, University of Pennsylvania, and the Philadelphia District Committee, American Society for Testing Materials.

Arrangements for the meeting have been made by a joint committee headed by Frederick Seitz, Department of Physics, University of Pennsylvania. Further information can be obtained by writing to the Department of Physics, University of Pennsylvania, or A. S. T. M. Headquarters 260 South Broad St., Philadelphia, Penna. All concerned with the subjects to be discussed are cordially invited to attend the conference.

Registry of Rare Chemicals

ESTABLISHMENT of a National Registry of Rare Chemicals has been announced by Harold Vagtborg, director of the Armour Research Foundation, Chicago, Ill., as the newest service of the foundation to American science and industry.

Information on chemicals too rare to be listed in the catalogs of regular chemical supply houses will be filed with the registry and indexed according to name, location, and amount available. Martin H. Heeren, chairman of chemical engineering research in the foundation, will direct this work and has been named director of the registry. No other complete listing of uncommon chemicals exists, nor has any ever been attempted on a complete basis.

Throughout the country's laboratories, schools, and industrial plants exist uncommon chemicals made for a highly specialized market and not generally known to exist, but which are constantly needed by research.

The registry does not store the actual chemicals, it does not buy or sell them, but merely maintains an indexed file of their sources and supplies. Chemicals to be found in the catalogs of supply houses are not included, but all those not available through regular channels will be listed.

The file will be regarded as confidential and will not be open to general inspection. Specific inquiries will be answered by the registry. Requests for data have been made of approximately 2,000 industrial and educational laboratories, and sources which have not been contacted are asked to cooperate in voluntarily submitting information needed in the files. Incomplete filings of certain specialized chemicals already indexed by private laboratories have been incorporated into the registry files. Pioneer work of the American Association of Scientific Workers toward a central informational clearing house on chemicals is included in that category.

Copperweld Holds Defense Bond Rally

Speakers who led a stars and stripes rally on defense bond sales and full-steam-ahead output on war-needed steels before employees of Copperweld Steel at Warren, Ohio. *Left to right.* D. G. Baxter, Copperweld plant superintendent; Robert H. Roberts, Warren mayor; Harry Wines, S. W. O. C. field representative; Sidney D. Williams, Copperweld executive vice president; S. E. Bramer, president; Clarence H. Klinger, attorney; and Frank Hunt, president of Copperweld S. W. O. C. Local 2243.

Industrial Waste Treatment Practice. *E. F. Eldridge.* 1st ed. 401 pages. McGraw-Hill Book Co., Inc., New York, N. Y., 1942. Price, $5.00.

THE author has drawn on his extensive experience at the Engineering Experiment Station, East Lansing, Mich., supplemented by the more recent literature, to prepare a comprehensive presentation of the treatment of industrial waste. Introductorily the general nature of the industrial waste problem is briefly presented. Methods of surveying stream pollution and the capacity of a stream for self purification constitute the first chapter. That leads to general characteristics of industrial wastes and methods of classification. Standard methods of treatment with the necessary structures and equipment follow. Having covered these topics in less than one quarter of the space, the author turns to specific industries, first outlining the commercial operations from which the waste originates, following it through treatment with numerous tables of characteristics before and after treatment.

The industries covered are beet sugar including utilization of Steffens waste; milk products; canning with particular attention to peas, tomatoes, beets, and corn as well as the full-line cannery; tanning of unhaired hides and sheepskins; pulp and paper with particular attention to recovery from white water and including strawboard; textile wastes from deterging, bleaching, dyeing, printing, and miscellaneous operations such as desizing, mercerizing, weighting, and carbonizing; meat packing and animal slaughtering; laundering; acid or alkaline metal-pickling solutions, waste cyanide solutions, and cyanide wastes from heat treating; gas and coke production including recovery and disposal of phenol; fermentation with attention concentrated on beer slop and malthouse wastes; oil production and refining. Each of these wastes is considered when combined with domestic sewage. Finally 18 pages summarize methods of analysis of industrial waste.

Treatment by the activated sludge process tends to accentuate Mallory's oxidized sludge. Emphasis is placed on recovery of materials for re-use where possible and on segregation of concentrated wastes. Yet recovery of tall oil from kraft waste is not mentioned, probably because of its location in a different region from the plants cited. Some industrial processes presented as yielding waste are not commercially important, "frosted" wool for example, but the author usually so states. By cross reference from given type of equipment in one industry where applicable to another, a great deal of repetition is avoided. The book is well printed. No significant errors were found; naturally there are a few minor ones.

The reviewer believes that this is a valuable reference for any engineer dealing with waste treatment as well as a suitable text for courses in sanitary engineering.

FOSTER DEE SNELL

Advances in Colloid Science. *Elmer O. Kraemer,* Editor, in collaboration with *Floyd E. Bartell* and *S. S. Kistler.* Vol. 1, 1st ed. 434 pages, 161 illustrations. Interscience Publishers, Inc., New York, N. Y., 1942. Price, $5.00.

THIS is the first of a series of volumes intended to provide a medium in which recent significant discoveries or advances in colloid science, either experimental or theoretical, may be presented in a more comprehensive and unified fashion than is possible in the regular technical periodicals.

This first volume contains the following 12 papers:

P. H. EMMETT. The Measurement of the Surface Areas of Finely Divided or Porous Solids by Low Temperature Adsorption Isotherms.
R. R. SULLIVAN AND K. L. HERTEL. The Permeability Method for Determining Specific Surface of Fibers and Powders.
ARNE TISELIUS. A New Method of Adsorption Analysis and Some of Its Applications.
JAMES W. MCBAIN. Solubilization and Other Factors in Detergent Action.
KURT H. MEYER. Recent Developments in Starch Chemistry.
R. E. POWELL AND HENRY EYRING. Frictional and Thermodynamic Properties of Large Molecules.
HARRY B. WEISER AND W. O. MILLIGAN. The Constitution of Inorganic Gels.
G. E. VAN GILS AND G. M. KRAAY. The Creaming of Rubber Latex.
JOHN T. EDSALL. Streaming Birefringence and Its Relation to Particle Size and Shape.
ROBERT J. MYERS. Synthetic-Resin Ion Exchangers.
THOMAS F. ANDERSON. The Study of Colloids with the Electron Microscope.
ERNST A. HAUSER. Anomalies in Surface Tensions of Solutions.

It is frankly stated in the preface that "the contributions should have an individualistic point of view, and should show a definite emphasis upon the author's own part in the development in question"; consequently it is not surprising that what may be considered undue emphasis on the work of certain individuals is encountered. The contributions are "not intended to be reviews or compilations from the literature in the usual sense"; consequently one cannot legitimately criticize them for what they were not intended to be.

Meyer's article on recent developments in starch chemistry, written from the point of view of both organic and physical chemistry is timely and an excellent presentation. The article by Edsall concerning birefringence and its relation to particle size is also outstanding. The articles by Tiselius and by Anderson describe two new and important experimental techniques. The adsorption analysis diagrams of the former and the electron microscope photographs of the latter are well chosen and the descriptions in each case are excellent.

Two articles, one by Emmett and the other by Sullivan and Hertel, describe different methods for the determination of the surface area of finely divided solids. The limitations of the methods as well as their applicability are set forth. Anderson's article gives information on distribution of particle size and is complementary to these two articles.

Powell and Eyring attempt to extend the statistical approach to the problems of chemical reaction rates and dynamic properties to the study of large and long molecules and their behavior in solution. A provocative article, but it may be a bit early to theorize about rates of diffusion, sedimentation, and dielectric relaxation for such systems when so little is known about these properties from an experimental point of view. In the sedimentation velocity section, a possible effect of variation of rotor speed on the sedimentation constant is discussed. Actually in the most modern analytical ultracentrifuges the solution in the cell is never, under any circumstances, subjected to a hydrostatic pressure of more than 500 to 600, usually not more than 300, atmospheres and, as a matter of experimental fact, no variation in the value of the sedimentation constant with rotor speed has ever been observed. In the treatment of dielectric behavior it seems that the various types of system, viz., solids, gases, pure liquids, and dilute solutions, are not sharply differentiated. Theories which

are developed to describe one situation may fail completely in another.

Weiser and Milligan present a summary of their own interesting work on the constitution of inorganic oxide and salt gels by the use of phase rule and diffraction techniques. Myers' article on synthetic-resin ion exchange reactions is a typical good review article on an interesting and relatively new subject. The contributions by McBain, Hauser, and Van Gils and Kraay are descriptive and of the type commonly found in the classical colloid chemistry.

The article by Van Gils and Kraay emanated from Java. Let us hope that it will not be long before the Dutch are again writing scientific articles in Java!

J. H. MATHEWS
J. W. WILLIAMS

British Plastics Year Book, 1942. 12th ed. 464 pages. Plastics Press, Ltd., Sidney Road, Bedford, England. Price, 15s.

NOTWITHSTANDING handicaps of wartime censorship and paper shortages, the annual British Plastics Year Book has appeared very much as usual and offers much of interest to those concerned with various plastic materials.

The editorial section is necessarily curtailed somewhat, but includes reviews of patents on phenol formaldehyde and ethenoid resins and on nylon, as well as one on progress in cellulose acetate during 1941. Patents for the latter are not included, but are being published in the monthly journal *British Plastics*.

The remainder of the book follows the general plan of its predecessors and includes the following sections: names and addresses of producers, associations, institutes, consultants and imperial trade inquiry offices; proprietary names and trademarks of the industry; materials used; plant and equipment; manufactured products; associations, federations, etc.; Who's Who; and miscellaneous data.

Handbook of Civilian Protection. *Civilian Defense Council, College of the City of New York.* 1st ed. 184 pages, 5.25 × 7.5 inches. Whittlesey House, McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $1.25.

IN BRIEF, clear fashion this pocket-size handbook discusses effective civilian organization for defense, responsibilities of air-raid wardens and home owners, duties of auxiliary firemen and individual fire fighters, the way to deal with incendiary bombs, precautions to take with high explosives, what to do in case of gas attacks, and effective first aid. Other chapters tell how to save materials ordinarily wasted and how to maintain health by following rules for a well-balanced diet.

There is a selected bibliography under each of the following headings: Total War and the Civilian, Air Raid Conduct and Services, Fire Fighting, Incendiary Bombs and High Explosives, Poison Gas, First Aid, Civilian Conservation and Salvage, and Nutrition in Wartime Emergency. Available motion pictures relating to civilian defense are listed.

For those actively engaged in civilian defense work the book provides a convenient and useful reference. For those who are not, it can be recommended as a clear, concise treatment of complex problems which no one can overlook today. Royalties from sales of the book will go to the Civilian Defense Council of the College of the City of New York to be used in furthering civilian defense activities.

Safe Practice Bulletins

Two new Safe Practice Bulletins have been released by the Department of Labor and Industry, Harrisburg, Penna. They are No. 94, "Removal of Volatile Fumes in Photolithographic Printing in Manufacture of Bottle Caps" by J. A. Cummings, Armstrong Cork Co.; and No. 95, "Safe Practice in the Manufacture and Application of Acrylic Plastics" by D. S. Frederick, Röhm & Haas Co. The publications are available free of charge on request to the department.

Journal of Chemical Education for May

THE *Journal of Chemical Education* for May contains, among others, the following articles:

C. R. ADDINALL. The Vitamins.
WALTER C. BEARD, JR. A Simple Sodium Press for the Small Laboratory.
FREDERICK H. GETMAN. The Old Tungsten Mine at Long Hill, Conn.
JACOB CORNOG AND FLOYD O. KRAUSE. Apparatus for Semimicro Filtration.
HOMER ADKINS. Carbonyl Compounds as Oxidizing Agents.
DAVID DAVIDSON. The Indicator Method of Classifying Acids and Bases in Qualitative Analysis.
RICHARD S. BEAR. Construction of Complex Molecular Models with Application to Carbohydrates.
F. W. FROMM. Lecture Experiment on the Synthesis and Combustion of Ammonia.
RAYMOND M. FUOSS. Electrical Properties of Solids. Part II.
LUIS F. LEROY. A Device to Demonstrate Electronic Transfer in Redox Reactions.
HAROLD BECHER. A Method of Teaching Thermodynamic Functions.
PAUL PORTER SUTTON. Phase Models for Ternary Systems.
C. H. JEGLUM. Liquid Glass and Solid Solutions.

Producing for War

"PRODUCING FOR WAR" is the title of a 115-page booklet prepared by the War Economics Division of the Research Institute of America and published in March this year. It is intended to help business men both in converting to war production and in obtaining suitable war jobs. There are details on government contracting and subcontracting, finance, and operation, together with discussions on efficiency and maintenance of labor supply. The compilation contains much additional specific information, including addresses of those in charge of government buying, construction, etc., for war needs.

The publication should be of value to those whose present problems relate to war production. It can be obtained from the institute, 292 Madison Ave., New York, N. Y., the price being $2.00 a copy.

Cleaning Gasoline Tanks

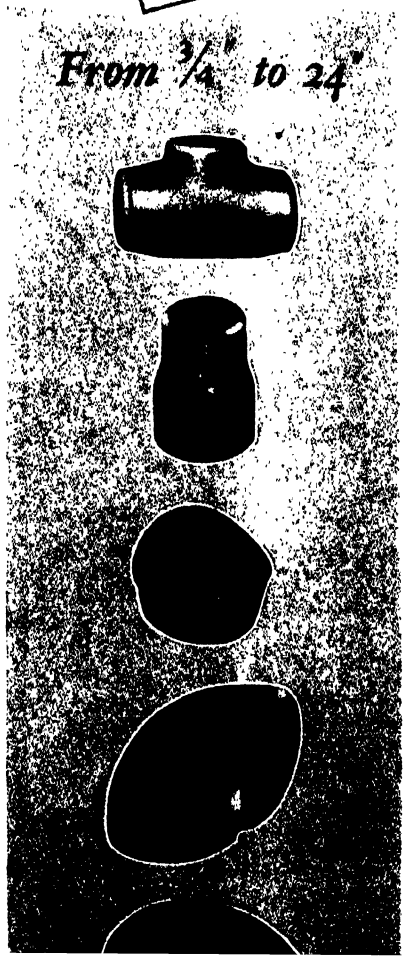
RECOMMENDED safe practices for cleaning crude petroleum and gasoline storage tanks are described and illustrated in two manuals published by the American Petroleum Institute's Department of Accident Prevention. Copies of the manuals, revisions of the single manual previously issued, may be obtained from the institute, 50 West 50th St., New York, N. Y., at 25 cents each.

THE Pfaudler Co., Rochester, N. Y., has devoted its April-May issue of *The Glass Lining* to wake-up-America appeal, from the red, white, and blue Uncle Sam poster cover through the publication's 15 pages. Articles are on America's rubber raw material problem, obtaining greater service from present dairy equipment, food and the war, manufacturing in Argentina, and other timely items.

Rubber and Plastics Research Center

A CENTER for study and research in rubber and plastics has been proposed by the Detroit Rubber and Plastics Group, Inc., Detroit, Mich. With the help of interested individuals and industries it is planned to establish a complete rubber and plastics laboratory at Wayne University, where arrangements have been made for allocation of space in the special problems laboratory of the Department of Chemical Engineering. It is expected that by September 1, 1942, equipment will be installed and courses available which will include an introductory course covering the properties and testing of rubber and plastics; compounding, molding, and testing of rubber and plastics; chemistry and advanced study of rubber and plastics; and research projects in both fields. The first three are to be one-semester courses, giving a knowledge of the fundamentals involved. C. W. Selheimer will be in charge of the instruction.

The group consists of approximately 450 members drawn largely from the industrial and educational plants in the Detroit area, with others from all sections of Michigan, northern Ohio, and Indiana. It was organized in 1927 with a nucleus of 12 members. The group plans to equip the laboratory complete with materials for experimentation and literature for reference, to supply lecture notes and lectures as needed, to maintain a committee to which questions may be referred, and to give actual training in laboratory processing.



Donations of some equipment as well as cash have already been received. J. C. Dudley, Chrysler Corp., Detroit, Mich., is handling the acquisition of equipment, while cash donations should be sent to E. J. Kvet, Baldwin Rubber Co., Pontiac, Mich., secretary-treasurer of the group. The executive committee is made up of J. H. Doering, chairman, W. B. Hoey, vice chairman, W. G. Nelson, counselor, F. Wehmer, J. C. Dudley, J. R. Shroyer, J. Miller, E. F. Riesing, and W. M. Phillips.

Cowgill Awarded Mead Johnson Research Prize

FOR research on the B vitamins, George R. Cowgill, associate professor of physiological chemistry at Yale University, was awarded the annual $1,000 Mead Johnson & Co. prize by the American Institute of Nutrition. Dr. Cowgill, in early experiments with the vitamin B complex, found that it had a remarkable effect on the urge to eat—the so-called "appetite effect". Most recent research at Dr. Cowgill's laboratories at Yale is concerned with perfection of completely artificial diets for mice to assist studies concerning the relation of cancer to diet.

WELDING FITTINGS BY

GRINNEL

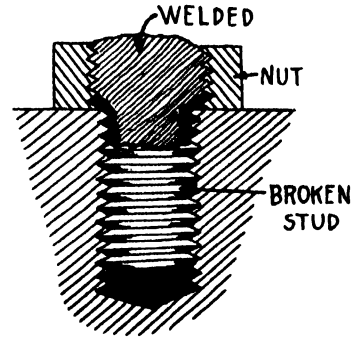
Industrial Heating with Creosote Pitch[1]

C. H. S. TUPHOLME, 65 Kinnerton St., Knightsbridge, London, S. W. 1., England

TO REDUCE the demand for imported petroleum fuel oil, some British plants are using a mixture of creosote and pitch, obtained during the manufacture of city gas. This material is produced in all gas plants in this country and substitution of this for fuel oil in installations has already resulted in a saving of tanker space amounting to hundreds of thousands of tons a year.

This mixture is viscous at ordinary temperatures, since it contains naphthalenes and anthracenes which tend to solidify and crystallize at temperatures below 90° F. to 110° F. The solidifying temperature is dependent upon the actual composition of the mixture and, unfortunately, the action is not reversible. Thus these tar oils, the most commonly used being creosote pitch, must be maintained at a temperature of not less than 90° F. at all times and delivered warm into suitably heated tanks. Before the creosote pitch can be atomized satisfactorily, its viscosity must be further reduced by heating it, immediately prior to burning, to a temperature of about 200° F.

In practice the warm oil is delivered into heated storage tanks and distributed to the various oil-burning equipments by a ring main system. An oil pump is employed to pump the oil through the ring main. From the ring mains, tappings are taken to the oil burners or to the burner feed pipe. The ring mains also require heating to prevent cooling of the oil during its circulation. The main storage tanks should not have a smaller capacity than 6 tons each, to be able to take standard 5-ton tanker deliveries. These tanks are heated with a withdrawable flexible heater, consisting of steel tubes welded into tanks, made in lengths up to 10 feet, and with a flexible withdrawable core inserted inside each tube. Heater cores can be withdrawn for inspection or renewal at any time without disturbing the contents of the tank, and the flexible feature enables a 10-foot core to be withdrawn in a space not exceeding 3 feet 6 inches. Modified standard straight-length heaters in 10-foot lengths, suitably connected in series, are clamped to the heat-insulated ring main pipes. This method of pipe heating has been satisfactorily employed for other purposes besides fuel oil and for temperatures to 662° F.



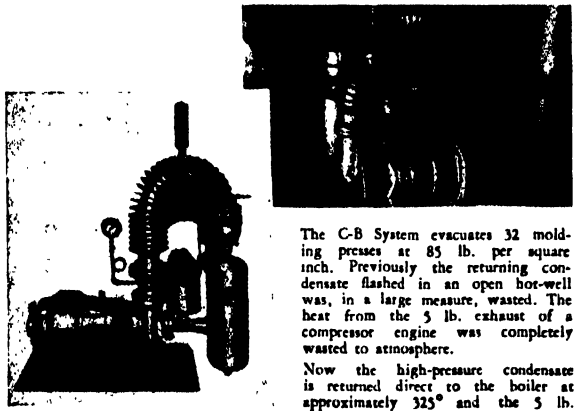
The burner oil preheaters consist of small chambers adjacent to the burners themselves, which are equipped with withdrawable-type flexible heaters, thermostats, and safety devices in the form of fusible plugs and pressure release valves. This method of heating has been used satisfactorily for large boilers, glass melting tanks, metallurgical furnaces, tube welding, vitreous enamel furnaces, and other types of furnaces including drying and enameling stoves and air heaters.

[1] The term "creosote pitch" is apparently a "topped tar" of American parlance, according to Wilbert J. Huff, U. S. Bureau of Mines. Crude tar and to some extent, perhaps, light topped tar have been used for industrial heating by American industries for a long time. Such installations were in operation in steel mills near Pittsburgh and Chicago in the early 1920's and it is understood the practice of burning tar, at least raw tar, has extended greatly since that time. Plants at which natural gas is available during the summer store the tar from their coke-oven installations at that time and burn the tar in the winter as their natural gas is purchased on an off-peak basis and is shut off when the residential heating load comes on in the winter.

How to Remove Broken Studs by Welding

W. F. Schaphorst
45 Academy St., Newark, N. J.

THE accompanying sketch shows a simple method of removing broken studs by welding. Now that even the smaller plants are provided with electric welding equipment, this method is within the reach of everyone.



An amply large nut is placed over the broken stud and the stud is built up by welding onto it and then welding to the nut. In that way the stud and nut become one solid piece and the stud can be taken out with a wrench. The welding process also heats the stud, causes expansion, and aids in loosening it.

W. C. Buchanan has resigned as president of the Allis-Chalmers Manufacturing Co., Milwaukee, Wis., because of ill health, but retains his membership on the board of directors and executive committee. **Walter Geist**, formerly vice president, has been elected executive vice president.

F. L. Craddock has been appointed by the Edge Moore Iron Works, Inc., Edge Moore, Del., as sales manager of the Mixing and Processing Equipment Division. Mr. Craddock was formerly president of the Mixing Equipment Co.

COCHRANE-BECKER SYSTEM
of HIGH PRESSURE CONDENSATE RETURNS at PIERCE-ROBERTS RUBBER CO., TRENTON, GIVES
INCREASED PRODUCTION
MORE ACCURATE TIMING OF CURE
FEWER REJECTS
+ 28% SAVING IN FUEL

The C-B System evacuates 32 molding presses at 85 lb. per square inch. Previously the returning condensate flashed in an open hot-well was, in a large measure, wasted. The heat from the 5 lb. exhaust of a compressor engine was completely wasted to atmosphere.

Now the high-pressure condensate is returned direct to the boiler at approximately 325° and the 5 lb. compressor exhaust is completely used in heating makeup.

WORLD-WIDE CHEMISTRY

Increased interest by foreign manufacturers of beverages has caused the government to sign a decree approving specifications for guaraná destined to export trade and providing measures for supervision of such trade. Guaraná, a plant growing in the Amazon basin, produces a stimulating beverage used by the old Indians as a nourishing product. The average annual production of seeds was estimated recently at about 200 metric tons, of which half was exported. The fruit of the guaraná tree is a little larger than a hazelnut and contains two or three seeds covered by a thin shell. Formerly Poland, Germany, France, and the United States were the best buyers of guaraná, but at present all exports are confined to the United States. Introduction of guaraná in other South American countries is being considered since it is thought that the beverage may compete favorably with others sold in those markets.

Production of Vegetable Oils and Fats Advances

The *Bulletin of the Federal Council for Foreign Trade* recently disclosed data on production of vegetable oils and fats in Brazil during 1940. A total of 124,483 metric tons was produced, against 101,140, 102,739, and 82,071 tons during 1939, 1938, and 1937, respectively. Of the total production 95.5 per cent was represented by the following oils: cottonseed 75.7 per cent; oiticica 6.3; babaçú 5.2; linseed 4.75; and castor 3.6. A new item, tung oil, appeared for the first time in the statistics of Brazilian oils with a production of approximately 52 metric tons. Production of another drying oil, taken from the iguapê nuts, increased to 96 metric tons against 34 in 1940. Output of coconut and babaçú oils also gained steadily. Another fat, called ucuuba and known also as vegetable tallow, is finding a steady market. It first appeared in the statistics during 1940 with 1,085 metric tons, rising to 1,357 metric tons in 1941. The ucuuba fat is obtained from seeds of a native tree which contain about 55 per cent kernel having from 60 to 70 per cent of a hard and yellowish fat used for edible purposes as well as for soaps and candles. The ucuuba fat is being used as a substitute for paraffin wax received from the United States. Production of corn, mustard pracaxí, and tucum oils disappeared from the statistics, signifying that such products were not produced during 1940.

Exports of Cotton Linters, Bran, Oil, Residues to U. S. Increased

Because of increased shipments of linters, residues, bran, and oil at higher unit prices, the value of exports through Santos set a record last year. About 400,000 metric tons of cotton products valued at 1,081,405 contos de reis (about $54,070,250) were exported by the state of São Paulo, against 371,680 metric tons valued at 801,328 contos de reis during the year of 1940. Exports of cotton amounted to 256,596 metric tons in 1941, compared with 185,525 in 1940. Linters increased in exportation from 37,909 metric tons in 1940 to 67,366 in 1941. During 1938 Brazil exported 559 metric tons of linters to the United States, while in the following years of 1939 and 1940 the quantities rose to 4,103 and 20,547 metric tons, respectively. Exports during 1941 will probably surpass all expectations since during the first nine months of 1941 the amount exported was over 45,000 metric tons of cotton linters.

Exports of cottonseed cake, however, dropped only 19,076 metric tons in 1941 against 118,328 in 1940. Residues, bran, and oil showed remarkable increase in exports during 1941, amounting to 2,178, 18,607, and 36,800 tons, respectively, against 431, 8,343, and 21,144 metric tons during 1940.

Brazil's Export Trade Continues to Improve

Because of the decrease in imports during 1941, coupled mainly with larger exports to the United States, Brazil's export trade continues to improve. Compared with 1940, exports during 1941 increased approximately 9.2 per cent in volume and 35.6 per cent in value. Imports during the same period declined about 6.6 per cent in volume and 11 per cent in value. Indicative of the increasing industrialization of Brazil are exports of cotton textiles which during 1941 amounted to 9,238 metric tons against only 3,959 metric tons during 1940. Exports of other manufactured articles rose to 39,611 metric tons from 29,948 during 1940. The largest market for Brazilian textiles continues to be Argentina and other South American countries, although shipments of cotton goods have been made to South Africa. Chemical and pharmaceutical exports amounted to 575 metric tons valued at 29,217 contos de reis in 1941 against only 345 metric tons valued at 16,245 contos de reis in 1940. These export products are mainly confined to other South American countries. Exports of iron and steel during 1941 totaled 55,434 metric tons against 31,098 tons in 1940; 24,031 tons in 1939, and only 5,766 tons in 1938. Despite the shortage of fuel oil used by cement factories, production of cement during the first six months of 1941 was 370,000 metric tons against 373,000 during the same period of 1940.

Increase of Sugar Output and Exportation Expected

Production of sugar in Brazil, the second largest sugar cane producing country in the world, has for some years been prorated among the large number of sugar mills. Production from the 1941–42 crop will exceed 1,200,000 metric tons and, although exports during the year of 1941 amounted to only 25,049 metric tons, Brazil will be able to increase the production in order to export a large quantity. It was reported in the *Bulletin of the Federal Council for Foreign Trade* that the Sugar Control Agency, the Institute of Sugar and Alcohol, is now studying with the American Embassy at Rio de Janeiro the possibility of increasing Brazilian sugar production to compensate for loss of Philippines production.

Exports of sugar during 1941 were made to Uruguay, Switzerland, Great Britain, Spain, Portugal, Egypt, Bolivia, Colombia, and Peru. Uruguay took 48 per cent of the total exports. About

---

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

100,000 tons could easily be exported from the 1942–43 crop, it is estimated, with further increases for future crops if some arrangements be made for postwar conditions.

Deposits of Strategic Minerals in Brazil Reviewed

Although Brazil is considered as possessing a large mineral resource of some strategic materials, very little has been disclosed regarding some minerals only mentioned as a matter of curiosity. Beryllium is undoubtedly one of the most important mineral resources, as Brazil is one of the world sources. However, the mining of beryl ores in Brazil is very recent. Export of this mineral started during 1938, with some 202 metric tons to Italy. In 1939 exports increased to 275 metric tons of which 204 were purchased by Italy, 68 by the United States, the balance by Germany and Great Britain. Exports during 1940 amounted to 1,472.5 metric tons distributed as follows: Germany 1,052 tons; the United States 419; Japan 1.5 tons. During 1941, however, all shipments of beryl ores totaled 1,702 metric tons of which 1,332 tons were destined to the United States and the balance to Germany and Japan, shipments being made during the first months of 1941. Brazilian ores contain an average of 10 to 11 per cent beryllium oxide, although several shipments were reported to have a 13 per cent content. Brazilian deposits are located in the States of Minas Gerase, Baía, and Rio Grande do Norte, and recently a new deposit was discovered in the State of Paraíba.

Several occurrences of antimony have been reported and the deposits of Morro do Bule, near Ouro Preto, State of Minas Geraes, and Cananéa, State of São Paulo, are considered of value for commercial exploitation.

Only one mercury deposit has been located in Brazil. The ore is cinnabar and was discovered in the vicinity of Dom Bosco city, State of Minas Geraes. Analysis in the Laboratorio da Produção Mineral showed a 79.45 per cent content of metallic mercury. The laboratory is studying ways to industrialize this deposit.

Although not yet produced on a commercial scale, some mineral containing radioactive metals could be obtained in Brazil. The most important deposit is located at Divino, State of Minas Geraes, where some samarskite and columbite also occur. In Divino, the pegmatite veins exploited for mica revealed by analysis contents varying from 13 to 18 per cent of uranium oxide. This deposit is constituted by 75 per cent samarskite, 15 per cent monazite, and 10 per cent columbite. Occurrences of other radioactive mineral ores were located in Ribeirão de Santa Clara, near Pomba city, State of Minas Geraes, and Cachoeiro de Itapemirim, State of Espirito Santo.

Zinc is another mineral now being commercially developed, although on a reduced scale. The main deposits of zinc ore are found in the Iporanga region, State of São Paulo, Morro do Bule and Januaria, State of Minas Geraes. The deposits of Morro do Bule are the largest in the State of Minas Geraes and consist of a blende with a zinc content of about 62 per cent. Small quantities of gold and silver were found associated with zinc. However, the Iporanga deposits are the most important in all Brazil. The reserves of this region were estimated to be about 30,000 metric tons with a zinc content varying from 31 to 36 per cent.

Cobalt is found associated with nickel in deposits at São José do Tocantins, State of Goiás. No production of this metal has been reported up to now, while exports of nickel ores containing cobalt were made previous to 1940 to Germany from which we imported 7,741 kg. of cobalt oxide in 1939 and 4,865 kg. in 1940.

Asbestos is produced in Brazil, although in insufficient quantity to meet local requirements. Some 610 metric tons of asbestos were produced in 1940, and estimated output for 1941 was around 800 metric tons. Asbestos deposits are located in the States of Minas Geraes and

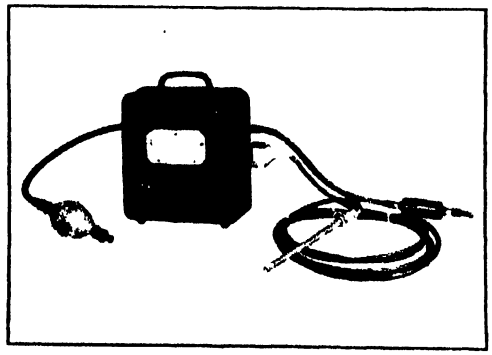
The Engelhard Flualyzer

YOUR GUIDE TO

BALANCED COMBUSTION



Checks Flue Gas Temperatures and CO_2 Content... *Simultaneously!*

For maintaining the balanced combustion that indicates full boiler or burner efficiency, the Engelhard Flualyzer is a fast, efficient and reliable instrument. It determines with extreme accuracy the carbon dioxide content of exhaust gases *and their temperature.* Only one flue tap is required for a simultaneous determination of both factors.

Readings in each instance are taken from a double range indicator calibrated from 0 to 20% of CO_2 and from 32 to 1000° F.

The Flualyzer's construction combines the time-proven Wheatstone Bridge Circuit for CO_2 analysis with a thermocouple circuit. It is portable, light weight and engineered to meet the most exacting requirements.

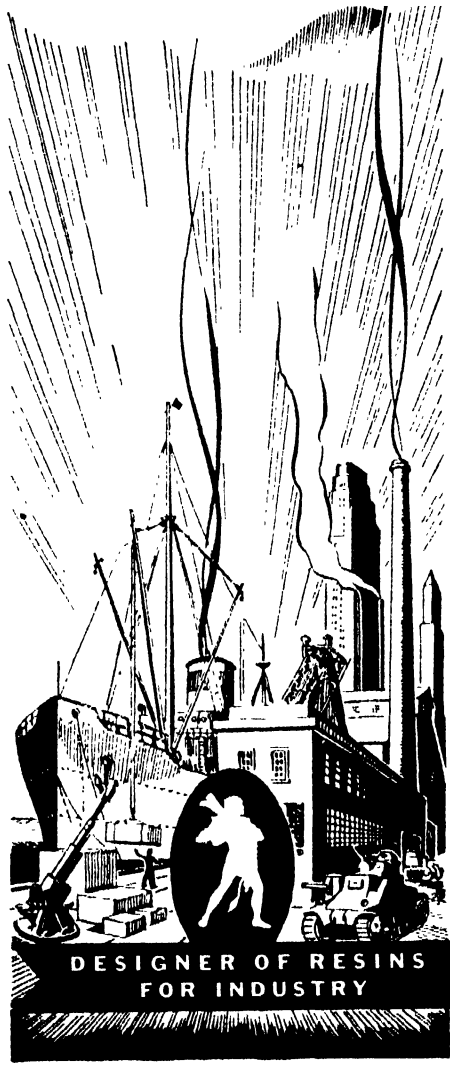
RESIN DESIGN



GOES TO WAR!

Not every resin is equally useful on the firing line—protecting our guns, ships, planes, and tanks. Some are more suited for camouflage, for surgical dressings,  for grease-proofing tough wrapping paper— or even for the prosaic but equally important things like locomotive paints or masking tapes.

Yet all are useful . . . somewhere. Our job, and it's yours, too, is to fit each pound of resin into its most effective niche in total production for Victory.

Ask us for a full  and frank discussion... going far beyond the limits possible in public print . . . about the established Hercules Rosin Esters . . . and the even more interesting potentialities of some brand-new Hercules resins.

Let's put our heads together  on how they can help your war effort. Thus your specific requirements can focus our knowledge of resin chemistry for a speedier victory — and to build toward a better future.

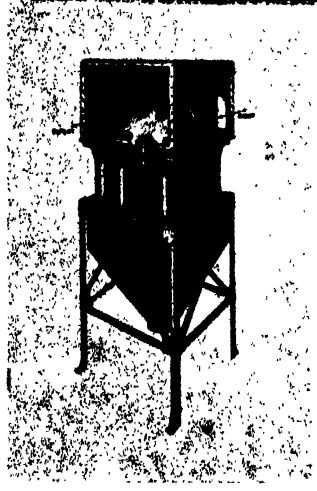
Bafa, and small ones exist in the States of Rio Grande do Norte and Paraíba. A very important deposit was discovered about a year ago and, although not yet completely inspected for reserve calculations, it was estimated as possessing more than 5,000,000 metric tons with an average content of 2.5 per cent of asbestos.

Tungsten is found in Mariana and Encruzilhada in the State of Minas Geraes under the form of stolzite and wolframite ores. The deposit of wolframite in Encruzilhada is the only one now worked. Exports of this mineral, previously made to Germany, are now prohibited with exception of shipments to the United States, due to necessity of filling demands of the national defense industries.



Tin will be produced on a large scale in Brazil as soon as installations for this production are finished in the State of Rio Grande do Sul. Deposits there are estimated at more than 400,000 metric tons with 60 to 65 per cent of tin.

MULTICLONES KEEP PACE WITH THE BATTLE OF PRODUCTION

Typical MULTICLONE Assembly

With war demands calling for production and *more production*, additional plant capacity is being required. The capacity of MULTICLONE Collectors can be increased by any multiple of the predetermined single tube capacity and efficiency. Additions to present initial installations can be made at any time and to any desired increase. A 50% increase over the original installation is illustrated above.

MULTICLONE COLLECTORS

U. S. Supplies 99.78 Per Cent of Chile's Rising Acetone Imports

MORE than 31 metric tons of acetone imported into Chile in 1941 continued the upward trend marking imports of this article in the past five years, the U. S. Department of Commerce indicates. The annual average for 1937–41 was 26.5 metric tons.

Germany, Great Britain, and the Netherlands accounted for about a fourth of the supplies until 1940 when the United States, in place of supplying the remaining three quarters of Chile's imports, accounted for 99.78 per cent of the trade.

Although acetone has a wide use in Chile, only small amounts are made there. Most important are the uses in metal working establishments, shipbuilding and repair plants, and as an absorbent for acetylene gas. It also is used as a cleansing material and in preparation of chloroform, pharmaceuticals and medicinal products, and miscellaneous antiseptics.

Gains Predicted for 1941 Cuban Insecticide Imports

INSECTICIDE and fungicide imports into Cuba probably will be found to have exceeded 1940 figures when the latest data have been compiled, official sources report. Drought conditions in 1941, coupled with excessive and unseasonable heat during the winter, brought a vast increase in the number of insect pests, including varieties hitherto unknown to Cuban farms and truck gardens.

Imports of insecticides by Cuba amounted to 306,755 kg. in 1939 and 226,378 in 1940. About four fifths of imports of this type were of United States origin in 1939. The most popularly used fungicides in Cuba are combinations of copper and some other chemicals and Bordeaux mixture.

United Kingdom Finds Substitutes in Empire

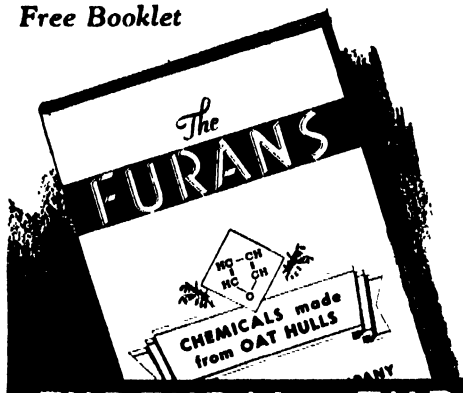
A PROMISING substitute for asbestine has been reported in technical sources in the United Kingdom, which also have reported sources within the Empire of cassava starch for use in cold adhesives. Previously the latter was obtained almost wholly from the Netherlands Indies and Madagascar. Tung oil produced in India has been found to be of high quality.

Chemical Imports into New Zealand Increase

WHILE no recent statistics have been released, trade observers report from New Zealand that chemical imports into that country increased greatly and were at a fairly satisfactory level in 1941 compared to immediately preceding years. Normally such imports approximate $15,000,000 annually.

FURFURYL ALCOHOL has found ready employment as a satisfactory alternative in many industries and production has not only continued satisfactorily but new and improved products have been created.

Furfuryl ALCOHOL



is proving itself in a field it entered recently. When faced with a shortage of anhydrous solvents heretofore universally used in making certain printing plates, lithographers turned to Furfuryl Alcohol. What was to be merely a substitute was found to be an excellent selective solvent, while one-quarter or less was needed to do a good job.

In many other fields Furfuryl Alcohol is finding profitable employment — as a dye and resin solvent, for acid-resistant coatings and as a highly satisfactory heat setting binder. It is worth your investigation. Try it. Write for complete information today.

IT'S LAYNE WATER SYSTEMS FOR THE ARMY, NAVY & WAR NEEDS

Built under extreme emergency and with amazing speed, thousands of Layne Wells and Pumps are providing billions of gallons of water for war needs—Army Camps, Flying Fields, Naval Stations, Ordnance Works, Chemical Plants, Munition Plants and numerous fortified outposts. Though built with utmost speed, those Layne Water Systems have the strength and ruggedness which will last for years and years.

Layne Well Water Systems, regardless of when, where or how speedily built, are the finest that can be constructed. They will faithfully fulfill their mission until victory comes, whether this year, next year or years from now.

Those men of the Army, Navy and Marine Corps who some day will return to civilian life may well remember that it was Layne who built the well water systems which helped to win the war.

In the meantime, essential civilian water supply service continues. The Layne organization is fulfilling its pledge of "Keep Them Flowing!"

Low-Grade Chromite Ores Treated Successfully

A METALLURGICAL process for treatment of the large American deposits of low-grade chromite ores to help meet wartime demands for chromium essential for armor plate, projectiles, and other vital military materials has been developed by the U. S. Bureau of Mines. Definite recommendations for the construction of commercial plants will be made when final data are received on additional tests now being made, according to the bureau.

The new method, known as a roasting and leaching process, is designed to convert chromite concentrates into a higher grade of material which may be used to produce either high-purity chromium or standard ferrochromium for the manufacture of alloy steel. The process was developed in the bureau's laboratories at Boulder City, Nev., and Salt Lake City, Utah, under direction of R. S. Dean, chief of the Metallurgical Division. It is capable not only of increasing the chrome content of the ore but can also raise the ratio of chromium to iron from about 1.7 to 1 up to as much as 30 or 40 to 1.

Vast deposits of low-grade chromite reserve ores in Montana, estimated at 2,500,000 tons, and deposits of similar ore in other western states are expected to furnish the raw materials for concentration plants and proposed processing plants. The Montana deposits are believed to contain enough chromium to yield over 900,000 tons of chromite (concentrates containing 45 per cent or more chromic oxide) of a grade suitable for making ferrochromium. This is equivalent to four and a half times the total amount of chromite shipped from domestic mines in the past 28 years.

Liquid Anesthetics Vaporized in Britain

ONE thousand apparatus at £125 each for vaporizing liquid anesthetics have been offered to the British war services by Lord Nuffield, the automobile manufacturer sometimes called "the Henry Ford of Britain". The machines were developed at the Nuffield Department of Anesthetics in the University of Oxford, which he endowed with five other medical departments in the university.

The machines are said to work without the aid of cylinders of gases necessarily employed in the customary apparatus. The patient breathes air through the machine, in which a chemical substance has been used to provide the vapor of the liquid anesthetic in the desired concentrations. For example, a pint bottle of liquid ether is transformed by the Oxford vaporizer into ether vapor and then automatically mixed with air to form approximately 5,000 times that volume of gaseous ether to be used as an anesthetic. The economy of space is particularly important in the present shipping shortage.

H. E. Doughty has been appointed assistant sales manager of the Jessop Steel Co., Washington, Penna.

U. S. Supplies Campeachy Extract, Hematin to Peru

THE United States in recent years has been a principal source of Peru's imports of hematin and campeachy extracts, accounting for 72 5 per cent of such trade in 1940 and sharing the market with Great Britain and France to minor degrees in that year.

Consumption of natural dyes in Peru is relatively small compared to use of coal-tar dyes. Imports of hematin and campeachy extracts are principally used in the tanning industry for dyeing leather black and by the Indians for coloring yarns.

Such imports amounted to 12,075 kg. in 1937; fluctuating in the intervening years, they amounted to 4,782 kg. in the first nine months of 1941. In 1937 the United States furnished 51 per cent and Germany 46 per cent of these imports by Peru. Germany dropped from the market in 1940.

U. S. Furnishes 37 Per Cent of Peru's Coal-Tar Dye Imports

THE United States furnished some 37 per cent of Peru's coal-tar dye requirements in 1940. The textile industry of Peru uses about 90 per cent of imports, followed by leather tanneries and dyeing plants for hats, paper, buttons, and other products.

Until 1939 Germany led in supplying coal-tar dyes, with other European countries as large sources, so that in 1937 the United States supplied only about 4 per cent of Peru's requirements. In 1940, however, Germany was still sending 27 per cent, with France, Great Britain, the Netherlands, Italy, Japan, and Switzerland as other sources.

Imports for the first nine months of 1941 were 194,458 kg., compared to 244,093 in 1940 and 171,947 in 1938, illustrating the fluctuating character of coal-tar dye sales in this market.

War Spurs Trade of U. S. and New Zealand

STIMULATION of United States–New Zealand trade by war has been revealed by a number of United States inquiries at Wellington, N. Z., for key raw materials. Talc, of which New Zealand is reported to possess promising deposits, and magnesite, of which there are millions of tons of high-grade quality in one region alone, were sought.

Ministry of Supply studies are being followed up by plans for government-controlled manufacture of agar from seaweed. Peat from the Chatham Islands, a New Zealand dependency, has been found to contain 10 per cent of montan wax. Development of wolfram is being pushed. Mercury is being produced in a region where cinnabar deposits exist, but production is not yet in quantity.

Portugal to Continue Argol, Wine Lees Exports to U. S.

INDICATIONS have been received from Portugal that large quantities of argols and wine lees will continue to be available during 1942 for shipment to the United States. Imports by this country from Portugal expanded to 5,674,000 pounds during the first nine months of 1941 alone, compared with 4,870,000 for the whole year of 1940.

The United States and United Kingdom are the principal importers of argols and wine lees from Portugal. It is reported that a factory is being established in Oporto to manufacture tartaric acid and baking powder, as a further enterprise in this direction.

United Kingdom May Buy Canadian Pine Tar

WHILE the United States furnishes the United Kingdom with higher grades of pine tar, a report indicates that the trade is studying samples of pine tar from Canada. Under present conditions, if sufficient quantities are available, this pine tar might find a ready market abroad.

Tar derived from jack pulpwood is not favored, however, since there is usually an admixture of residue from pulp operations. Pine tar imports are dependent upon granting of import licenses, which limited such imports to the United Kingdom to 300 tons in September to December 1941.

Market in Chile for Insecticides Declines

A RELATIVELY large production of rat poisons and insecticides combines with a somewhat smaller demand, in Chile, to lessen the market for these commodities. United States exports of these articles to Chile, including insecticides, fungicides, and disinfectants, amounted to 545,000 pounds valued at $72,000 in 1940, compared to 480,000 pounds at $43,700 in 1939. Only a small proportion of these sales, however, represent the household forms of the commodities, the bulk being for agricultural use.

Trinidad's Demand for Lime Products Increases

INCREASED demand abroad for some lime products is indicated by a recent consular report from Trinidad, British West Indies. Exports of distilled lime oil rose from 49,373 pounds in 1940 to 64,798 pounds in 1941. Exports of hand-pressed lime oil, however, dropped from 1,505 to 515 pounds. Raw lime juice exports for 1940 were 110,841 gallons, compared to the 1941 figure of 82,361 gallons. Exports of green limes were 443 barrels in 1941, representing a 291-barrel gain over the previous year.

U. S. Part in Peruvian Pyroxylin Imports Rises

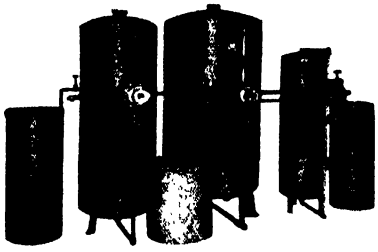
THE United States in 1940 became the source for 71 per cent of pyroxylin lacquers used by the Peruvian shoe and leather trade. This country's share in the total of such trade was 95.6 per cent, counting all pigments. Most kinds of leather, except sole leather and some blacks, are finished with pigments and lacquers in Peru, and imports of pigments for leather by that country have advanced steadily from the 17,546 kg. reported in 1937.

In the following year they had risen to 21,753 kg., in 1939 to 26,119; 1940 to 26,692; and for the first nine months of 1941 18,894 kg. The increase in pyroxylin imports has paralleled that for pigments, from 4,350 kg. in 1937 to 14,456 kg. for the first nine months of 1941. Pyroxylin lacquers are used in Peru particularly in finishing and waterproofing white shoe leather.

Casein Supply in Canada Runs Low

CANADA is having trouble obtaining adequate supplies of casein needed for war work, and a temporary tariff reduction is in force to stimulate supplies. Normal requirements are about 2,500,000 pounds annually, of which domestic sources furnish 1,000,000 and New Zealand an equal amount. The latter country has ceased granting permits for export of casein, however, so is no longer a source for Canada. Certain large Canadian paper companies, it is stated, are no longer able to obtain supplies for coating paper as a result of pressure on casein stocks.

Imports into Uruguay of Carbon Tetrachloride Gain



IMPORTS in 1941 by Uruguay of carbon tetrachloride were up 25 per cent compared to former years. Imports were 99,600 pounds in 1939 and 190,400 pounds in 1940. Prior to 1939 the demand was comparatively light. Carbon tetrachloride is used in preparation of worming formulas for sheep raising in that country.

New Refrigeration Plants Established in Ecuador

REFRIGERATION and ice-making plants are a necessity in Ecuador, and a number of small plants are found throughout the country. All use anhydrous ammonia. Two new plants were recently reported placed in operation in Ambata and Ibarra, in addition to a plant at Quito for a concern manufacturing beer.

FORMATION of an association of importers and distributors of arsenic in the United Kingdom to handle all supplies of this material is reported. Supplies will be allotted on a quota basis.

We Can Save Money
for Users of
DISTILLED
WATER
by chemical treatment
WITHOUT HEAT!

OPERATION — The process is one of ion exchange using the Amberlite synthetic resins. In operation, water passes through two beds of special minerals, the first of which removes, by base exchange, the positive ions, such as calcium, magnesium, sodium, or iron, substituting hydrogen. The hydrogen combines with the negative sulphate, chloride, and nitrate ions to form the equivalent acids. (The carbonates form carbonic acid which passes on through as CO_2 and water, and the CO_2 can be very largely dispelled by aeration if its presence is undesirable.) This acidic water passes to a second tank where the negative ions (chlorides, sulphates, and nitrates) are removed by adsorption, giving a final effluent which compares very favorably with single distilled water.

1,000 gallons for less than a dollar!

Water produced by the Illco-Way method replaces distillation at *a fraction of the cost* . . . and meets the exacting standards of pharmaceutical houses, chemical plants, distilleries, mirror and battery manufacturers, porcelain enamelling plants and other industrial concerns requiring purified water.

Completely automatic (between periodic regenerations) — water is not evaporated, so no heat is required — pipes will not lime up — minimum maintenance cost. A unit delivering 300 gallons an hour occupies space about 4 x 10 feet. Made of finest material to protect purity of water. Available in units affording from 150 gallons an hour to 15,000 gallons an hour.

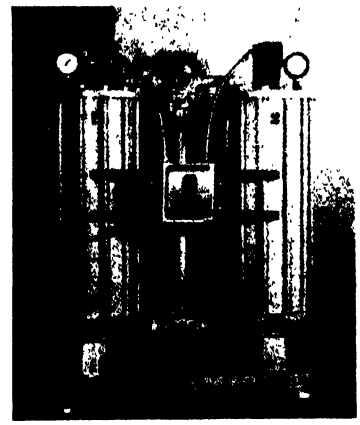
Nitric Acid Needs May Be Cut by Metal-Treating Process

QUANTITIES of nitric acid, vital ingredient of high explosives, may be released for war use if a new process of treating stainless steel proves commercially successful. The method was described before the meeting of the Electrochemical Society April 18 by Herbert H. Uhlig, General Electric Research Laboratory, Schenectady, N. Y.

To improve appearance and give greater resistance to corrosion, stainless steel is usually treated with nitric acid to which a little hydrochloric acid has been added. Dr. Uhlig explained that the metal surface consists of microscopic peaks and valleys, and the effect of the acid is to eat away the peaks while only slightly affecting the valleys, making the surface smoother. Hydrochloric acid alone will produce a different effect, he said, for it attacks both peaks and valleys and the appearance and corrosion resistance are not improved.

By adding a chemical inhibitor to the hydrochloric acid, Dr. Uhlig found that the valleys are protected. This produces on the stainless steel a surface equal to that with nitric acid. The hydrochloric acid treatment for stainless steel may help prevent any shortage in the explosives industry, he suggested.



Kenneth H. Barnard, for several years assistant superintendent and chief chemist of the Print Works Division, Pacific Mills, Lawrence, Mass., has been transferred to the New York Sales Department at 40 Worth St. He will be director of the company's new Products Research Laboratory where the textile requirements of large textile buyers will be investigated and new products developed to meet them.

Preparing Intravenous Solutions

Intravenous dextrose and saline solutions for hospital use are subjected to exacting control at the Sterisol Division, Schering & Glatz, Inc., New York. Pyrex glass is used in the tubing through which liquids flow while the solutions are in preparation, simplifying supervision and guarding against contamination of the contents.

WHY WORRY ABOUT MOISTURE IN COMPRESSED AIR

Lectrodryer using activated aluminas provides freedom from moisture problems in air operated controls.

Many users of air operated control equipment have found that LECTRODRYER thoroughly dries their compressed air. LECTROFILTERS used with LECTRODRYERS provide freedom from oil vapor troubles.

If you want more information on LECTRODRYER equipment for this purpose tear out this page, fill in the blanks, and mail it to us so that we may quote you on LECTRODRYER equipment for handling your requirements.

1. *Do you want to dry compressed air continuously 24 hours a day?* _____

   If not, how long are the drying periods?

   _____

   This information will enable us to determine whether a single or dual adsorber LECTRODRYER should be used. Single adsorber LECTRODRYERS dry air intermittently, dual adsorber LECTRODRYERS operate continuously.

2. *What is the volume of air to be dried at atmospheric temperature and pressure and at what pressure will the drying be carried on?* _____

3. *At what temperature will the air enter the LECTRODRYER?* _____

   Will the air or gas be saturated at this temperature? _____

   The answers to the two questions above will enable us to determine the proper size and type LECTRODRYER for your use.

   Air-cooled electric reactivated LECTRODRYERS handle small quantities of compressed air; larger quantities sometimes require water-cooled LECTRODRYERS which may be steam reactivated or electrically reactivated.

4. *How dry do you want the air?* _____

   LECTRODRYERS dry compressed air to dew points as low as minus 60 degrees C and even lower. If you don't know exactly how dry the air should be, indicate whether extreme dryness or moderate dryness is desired.

5. *Do you have 110 volt, single phase, 60 cycle power available?* _____

   Most small LECTRODRYERS operate from this power supply.

6. *Do you have 220 volts, single phase, 60 cycle power available?* _____

   Do you have steam at approximately 100 pounds pressure? _____

   Larger LECTRODRYERS operate either from 100 pounds steam or 220 volt power supply as specified by the Purchaser.

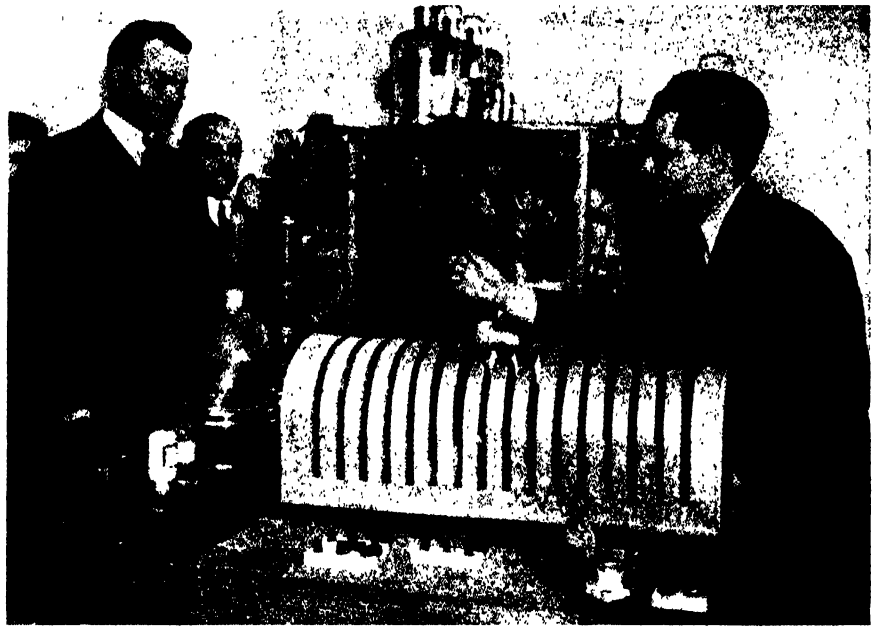
32ND STREET AND A. V. R. R., PITTSBURGH, PA.

SARGENT HYDROASPIRATOR IMPROVED



Already rated as one of the fastest filter pumps available, the Sargent Hydroaspirator now offers in addition to this advantage, an improved valve system which effects an *immediate* water tight seal, completely preventing entry of water to the suction line when suction is stopped.

The efficiency of these pumps with respect to speed and sealing action is uniformly maintained among individual pumps by extremely precise machine operations used in their production.

Extraction of Aluminum from Clay

Alfred R. Globus, right, 21-year-old Brooklyn, N. Y., resident, demonstrates his method of extracting aluminum from common clay to Walter L. Rice, vice president of the Reynolds Metal Co., Richmond, Va., one of several representatives of metal firms and the press who saw the demonstration. The process is basically one of dissolving the clays with sulfuric acid and sodium hydroxide. Electrolysis is used to recover the acids. Where there is a lot of iron in the clay, the electrolysis serves to separate it from the aluminum and to recover the iron as a by-product. Experiments are still in the laboratory and pilot-plant stage, and experts at the demonstration said that probably an industrial trial only could show whether the process is worth while. Mr. Globus claims he will be able to produce 200 to 250 pounds of aluminum from a ton of usable clay at a cost of 1 to 2 cents per pound.

During its many years of glass making, Corning Glass Works has developed more than 25,000 glass formulae. More than 250 different formulae are used in daily production.

Of all these formulae, none is more important to the laboratory than the formula used for PYREX brand Chemical Glass No. 774. For the development of this glass not only made America independent of foreign sources for heat-resistant laboratory ware, it did far more.

In 1915, for the first time, America had a *Balanced Glass* whose properties—mechanical and thermal strength and chemical resistance—were *scientifically balanced* for maximum laboratory usefulness, and economy through long life. Its balance gives to "PYREX" Laboratory Glassware the important qualities that make it the all-around glassware for all-around laboratory use. Consult your regular laboratory supply dealer.

"PYREX" and "VYCOR" are registered trade-marks and indicate manufacture by

CORNING GLASS WORKS • CORNING, N. Y.

PYREX CORNING VYCOR

Educational Movie on Arc Welding Available

EXPECTED to play a part in speeding the training of thousands of metal arc welding operators needed for the fabrication of war equipment is the new six-part, all-color General Electric sound movie, "The Inside of Arc Welding". The first part of the movie, complete in itself, is now available. The other five parts will be ready early in June.

It has been estimated that use of the film should help cut the training time of new welders 20 per cent in addition to giving trainees a better understanding of the principles of arc welding. Vivid charts, animation, demonstrations by expert operators, closeups of the arc in action, as well as cross sections of good and bad welds are combined to bring to even the largest of classes the benefit of individual instruction.

Each of the six parts of "The Inside of Arc Welding" is 400 feet long, 10 minutes in duration, and can be used on sound-equipped 16-mm. projectors only. The films may be obtained for single showings or bought at print cost by writing General Electric's Visual Instruction Section, Schenectady, N. Y.

Howard W. Broecker has been appointed assistant district manager of the Copperweld Steel Co. in the Chicago district.

INDUSTRIAL PRODUCTS BY FERMENTATION PROCESSES

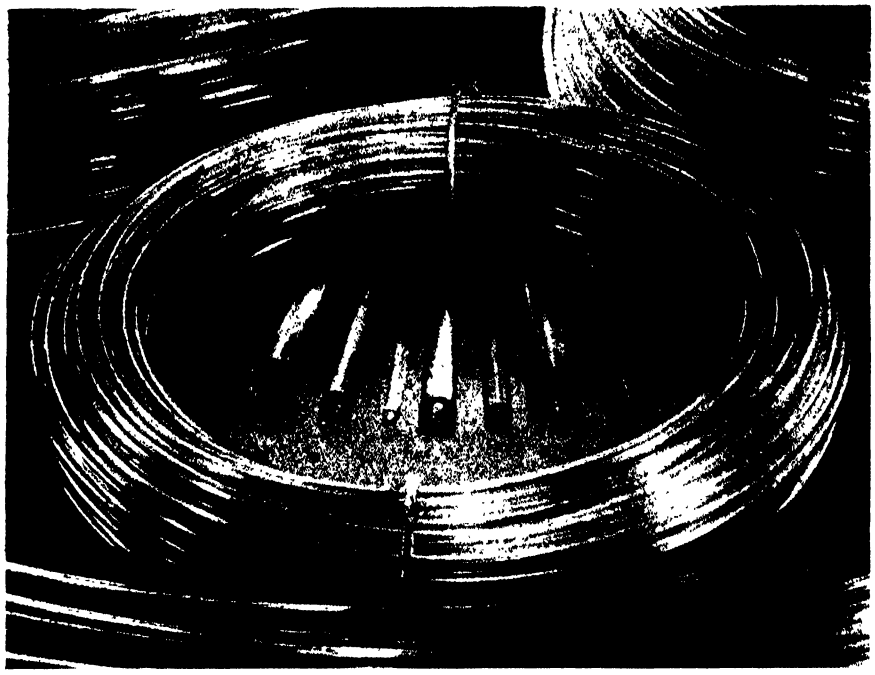
NOAH has received credit for one of the earliest recorded chemical discoveries. He found that under some conditions grape juice underwent a change and the resulting product, when imbibed, produced a pleasant physiological effect entirely different from that which the original juice gave. Unfortunately, as a result of continuing his testing "not wisely but too well", he has received some undesirable notoriety.

It was also observed at an early date that sometimes fruit juices underwent another type of change which resulted in the development of sourness. Milk was also found to become sour on storage. Since the resulting products found practical use, empirical methods of regulating these alterations were developed.

Not until the investigation of Pasteur was it recognized that these changes were due to the growth of various microscopic organisms. It had been noticed earlier, however, that the development of visible organisms, termed molds, also resulted in changes of the medium on which they grew.

Since Pasteur a large number of experimenters have developed methods not only of preventing, but also of encouraging, the growth of these organisms, both visible and microscopic. Others have studied the chemical changes brought about by them. It is now recognized that these reactions are similar to, or in many cases the same as, those occurring during the development of a fruit or vegetable and are natural vegetative processes.

As a result of some of these researches a considerable variety of products of industrial importance is now being manufactured by the careful cultivation of a number of these organisms. Since this is a comparatively new field, it can safely be assumed that with time the number of compounds produced by such methods will be greatly enlarged. The probability of this is increased by the fact that the raw materials for such processes are generally of American agricultural origin, thus removing any dependence on foreign products.



Chas. Pfizer & Co., Inc. has been one of the leaders in this field and is at present producing Citric Acid, Gluconic Acid, Fumaric Acid, and Oxalic Acid by such methods. From these acids a wide variety of derivatives is being manufactured. A well-trained research staff is engaged in the improvement of present processes and in the development of new products. Results in many of these latter investigations indicate that products of possible importance in a variety of fields will in time be made available.

PFIZER QUALITY

Tubing of Transparent Plastic

Transparent Tenite tubing in sizes ranging from 3/16 to 3/4 inch in diameter is unbreakable and may be readily bent, formed, or curved to fit almost any condition. The ends may be adjusted to standard flared fittings with the same tools that are used for copper tubing. Large diameter tubing with a wall thickness of 1/16 inch can be threaded with standard thread-cutting tools. The tubing is extruded by Extruded Plastics, Inc., from a cellulose acetate butyrate formula of Tenite produced by Tennessee Eastman Corp., Kingsport, and distributed by Julius Blum & Co., Inc.

Plants for Butadiene to Be Built

PLANS for production of butadiene, synthetic rubber base, have been announced by the Gulf Oil Co. and Standard Oil Co. of Indiana. Gulf and four other concerns have organized the Neches Oil Co. to design and build a plant in Texas. Location of the Indiana Standard plant has not been selected.

Project Sponsored at Institute of Gas Technology

REMOVAL of organic sulfur from manufactured gas will be studied at the Institute of Gas Technology under a $12,000 project sponsored by the Rochester Gas and Electric Corp. Such sponsored programs are a part of the research activities of the eight-month-old institute, which is located at and affiliated with the Illinois Institute of Technology in Chicago. The Rochester project is one of the initial sponsored studies established at the institute.

Reichhold to Expand Output

A $2,000,000 expansion program is planned by Reichhold Chemicals, Inc., Detroit, Mich. The project calls for erection of a $1,500,000 plant for production of phthalic anhydride, chemical plasticizers, aldehydes, and alcohol. The new expansion is a step toward doubling output of the company in 1942. Production was also doubled in 1941.

War Production of General Electric

THE General Electric Co., Schenectady, N. Y., has thrown into wartime production every available employee, has added to its manufacturing facilities beyond the company's wildest peacetime dreams, and its 130,000 workers, 50 per cent more than a year ago, are committed to a determination of victory against the aggressors in this war, Charles E. Wilson, president of the company, declared recently. Mr. Wilson explained:

Conversion has not been a simple matter. You do not just stop making refrigerators and radios and washing machines and heating plants. Stopping had to be a gradual process if partially fabricated materials were not to be wasted, if our commercial system was not to fall into chaos overnight, if we did not want to add an agonizing unemployment headache to our other troubles. I doubt if most people today know how long ago business began the job and how hard it has worked to make conversion take place fast and efficiently.

Citing as an example of how this conversion process works, Mr. Wilson told of a visit to the world's largest electrical appliance manufacturing plant:

You would have been cheered, as I was, in seeing room after room filled with fascinating war devices. These were not just ideas and blueprints and samples. They were weapons well along in production at the hands of trained workers—things that are coming off the line. Many of them came as ideas or hunches from the armed services, ideas that needed hours of practical engineering magic to make them come true. There was a bombing device that had seen years of service in Europe, complicated and expensive to make. Now it has been Americanized—75 per cent simpler and 80 per cent cheaper. There are devices that take searchlight beams and tie them in knots around enemy aircraft so they cannot get away. There are synchronized firing devices for guns. There are strange applications of invisible light. The men who designed the new radio which you may have purchased this year have been engaged for more than a year in building vital electronic devices for combat and protection; they started early in the game, converting their special skills.

DEPT. 351-E RESEARCH APPARATUS DIVISION

INVESTIGATE *Resin and Lacquer Emulsions* as LATEX SUBSTITUTES

—Extenders and Modifiers

Resin and Lacquer Emulsions have been finding an ever-widening use in many industries. They have proved invaluable in replacing other materials in adhesives, modifiers, binders and fillers, grease proofing, waterproofing, sizing, impregnating, coating, color dispersions and innumerable other uses.

In the Rubber Industry these emulsions are being used today as *Latex Modifiers* and *Complete Latex Replacements* to extend, thicken, stabilize, increase penetration, improve resistance to acids, oils and solvents, and to mechanical coagulation, etc.; *in Coatings* to produce adherent pigmented coatings and as intermediate coats for lacquer on rubberized cloth: in *Rubberizing* textiles; in *Latex Treated Papers* to increase strength and improve ageing; in *Adhesives*, for paper, for leather to cloth, and cloth to cloth.

These are just a few of the known applications in the rubber field. Undoubtedly in your own plant you will find many uses for these emulsions to improve your products and extend the supply of the vital materials, LATEX and RECLAIMS.

Our Technical Staff will be glad to make recommendations to meet your specific problems. Write today for additional information.

A Few of Our Products of Interest to the Rubber Industry

•

ALKYD 17-B A permanently tacky, alkyd type resin emulsion containing 40% solids. When mixed in equal proportions with normal latex, the mixture for all practical adhesive purposes is indistinguishable from latex.

ALKYD 18 An alkyd type resin emulsion which is non-yellowing and non-oxidizing. Film is water-white and non-tacky. Preferred where slight oxidizing action may be considered harmful to rubber. Extender for latex in coating, combining and impregnating processes.

EMULSION 58-B A series of emulsified elastometers containing up to 65% solids. Recommended for use as full latex replacements in impregnation and combining

PIGMENT BASES Concentrated aqueous dispersions of pigments in resin bases, available in all shades and viscosities, suitable for spreading, spraying, etc.

Also Acrylic, Vinyl, Maleic, Phenolic, Hydrocarbon, Ethyl Cellulose, Cellulose Acetate and Nitrate emulsions and solutions for various applications.

GREATER PRODUCTION *DEMANDS* GREATER CONTROL

Control in processing is going to become more difficult — as it becomes more necessary. Organizations are being disrupted at a time when greater demand for war material and substitutes for metal are adding an increased load to the process industries.

Investigate Prater equipment — for many phases of grinding and mixing it offers complete uniformity of results unfailingly delivered.

Every Prater Mill is sold on a basis of guaranteed output per horsepower hour and control of quality of grind and grain size.

May we analyze your problem?

Plexiglas for Protection and Visibility

Seated inside a Plexiglas enclosure, the Lockheed P-38 pilot enjoys excellent visibility and complete protection from the elements. The permanent clarity and high impact strength of the Röhm & Haas product, Plexiglas, assure these design advantages while its light weight and ease of forming make it practical for aircraft use.

How you can extend or replace scarce solvents

The shortage of many solvents, thinners, wetting and dispersing agents can be greatly relieved by making full use of terpene chemicals developed by Hercules.

These terpene derivatives — Solvenol* No. 1, Dipentene No. 122*, Yarmor* 350, Hercosol* No. 80, the Terposols*, and others—have different characteristics, but when properly combined with other solvents, they offer a wide choice of such desirable properties as solvent power, evaporation rate, tolerance for thinners, anti-skin effect, and promotion of flow. Certain of them are also useful in reclaiming rubber, in textile chemicals, perfumes, insecticides, processing leather, and other important applications.

Through our research, we have learned a good deal about successful methods of fitting these terpenes into various processes. This knowledge is at your disposal. We shall be glad to work closely with you, or to mail you literature, which gives typical analyses and describes the characteristics of each of the Hercules Terpene Chemicals. Just write or mail the coupon below.

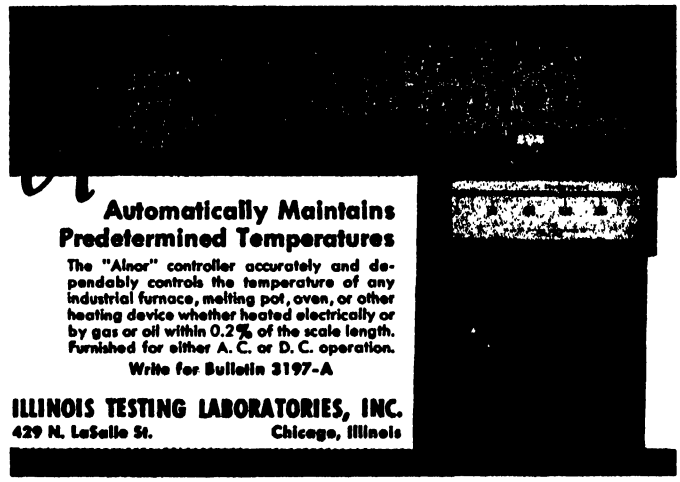
SV FILTRATION CYLINDER

The Standard Volume Filtration Cylinder was designed to permit filtration directly into a 100 ml. volumetric flask. The apparatus, as illustrated, consists of a heavy wall glass cylinder approximately 9" high × 3" I.D. with a heavy base, and a special heavy rubber stopper of sufficient thickness to prevent flexing when the suction is applied. The flat edge of the stopper sits on the rim of the cylinder. In use, this stopper gives an air-tight seal without any danger of splitting the cylinder as would be the case if the taper of the stopper were involved. A center hole in the large stopper accommodates an ordinary Gooch Crucible Adapter.

M 7458



A glass funnel tube with a finely drawn tip is provided to give a fine stream to prevent the filtrate from blocking the neck of the volumetric flask which would result in the solutions being lost in bubbling.

A three-way metal stopcock is supplied to which the suction line is connected and need not be removed during use. In one position the stopcock admits air to the filtration cylinder and turns off the suction. In the other position, the air inlet is closed, and the suction is connected to the filtration cylinder.

M 7458 SV Filtration Cylinder, complete as described, with Crucible, Rubber Adapter and Volumetric Flask, **$12.50**

THE EMIL GREINER COMPANY

STEAM JET EVACTORS

AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

ANHYDROUS ALUMINUM CHLORIDE in ORGANIC CHEMISTRY

CHARLES ALLEN THOMAS, Central Research Director, Monsanto Chemical Company

In collaboration with Mary Baluk Moshier, Herbert E. Morris and R. W. Moshier, Thomas and Hochwalt Laboratories, Monsanto Chemical Company

A. C. S. Monograph No. 87

This volume has been eagerly awaited for some time by all those concerned with the catalysis and isomerization of organic compounds. The reactions of aluminum chloride with hundreds of compounds are discussed in detail; and a feature of the book is the presentation of the exact changes which occur in structure. A résumé of the work of Friedel and Crafts, who did the pioneer work in this field, is included. This is indeed a monumental compilation which will be invaluable to research workers in the fields of petroleum, plastics, rubber, synthetic coatings, flotation agents, dyes, fats and waxes, cleansing and dry-cleaning agents, perfumes and textiles.

—Chapters—

Introduction
Historical Sketch of Charles Friedel and James Mason Crafts
Physical Properties of Anhydrous Aluminum Chloride
Mechanism of Reactions Catalyzed by Anhydrous Aluminum Chloride
Friedel-Crafts Syntheses. Part I. Reactions of Aromatic Hydrocarbons with Halogenated Compounds other than Acyl Halides
Friedel-Crafts Syntheses. Part II. Ketone Syntheses
Friedel-Crafts Reactions. Part III. Ring-closure with Evolution of Hydrogen Halide
Addition Reactions. Part I.
Addition Reactions. Part II. Syntheses of Keto-Acids from Dicarboxylic Acid Anhydrides
Aldehyde Syntheses
Aromatic Halogenation
Dehydrating Condensations
Dehydrogenating Condensations and Reduction Phenomena
Miscellaneous Condensations
Aromatic Rearrangements and Migrations
Effect of Anhydrous Aluminum Chloride on Aromatic Compounds
Anhydrous Aluminum Chloride in Aliphatic Chemistry
Polymerization
Anhydrous Aluminum Chloride in the Petroleum Industry
Preparation, Manufacture, and Purification of Anhydrous Aluminum Chloride
Notes on Application of Anhydrous Aluminum Chloride. Author Index, Subject Index.

MANUFACTURE OF SODA

Second Edition

by Te-Pang Hou, Ph.D.

A. C. S. Monograph No. 65

THE present acute shortage of soda ash and the consequent rapid expansion of existing plant facilities make the publication of this volume an event of the first importance not only to the soda industry itself, but to others closely related to it. New plants will be brought into production, older ones enlarged, and every effort will be made to attain maximum operating efficiency from all. It is in this connection that this book will be of particular value, for it constantly stresses the importance of efficiency, and explains precisely the best methods of attaining it.

—Chapters—

Introduction. Historical Survey of Alkali Industry and Relation of LeBlanc Soda Industry to Development of Other Chemical Industries
Natural Soda
History of Ammonia Soda Process: Statistics
Preparation of Brine: Rock Salt and Sea Salt
Purification of Brine
Burning of Limestone
Ammoniation of Saturated Brine
Carbonation of Ammoniated Brine
Working of Carbonating Towers or "Columns"
Filtration of Crude Sodium Bicarbonate (Ammonia Soda): Composition of the Bicarbonate
Composition of Mother Liquor from Carbonating Towers
Phase Rule in Tower Reactions: Graphical Representation of Ammonia Soda Process
Decomposition of Sodium Bicarbonate by Calcination
Recovery of Ammonia—Efficiency of Operation in Ammonia Still
By-Products from Distiller Waste
Allied Products of Ammonia Soda Industry
Position of Ammonia Soda Industry
Manufacture of Refined Sodium Bicarbonate
Manufacture of Caustic Soda—Chemical Process
Manufacture of Electrolytic Caustic, Chlorine, and Chlorine Products
Wet Calcination of Sodium Bicarbonate
Generation of Power for Ammonia Soda Plants
Boiler Operation and Conditioning of Boiler Feed and Cooling Water in Ammonia Soda Plant
Special Requirements of Ammonia Soda Industry
Control in Ammonia Soda Process
Losses and Consumption of Raw Materials in Ammonia Soda Process
Modifications and New Developments of Ammonia Soda Process
Chemical Analyses and Tests in Alkali Industry
Behavior of Soda Ash in Storage
Layout, Design and Location of Ammonia Soda Plant
Centrifugal Pumps Applied to Ammonia Soda Industry
Appendix, Index

Industrial Literature

CONTINUED FROM PAGE 636

mentals of Induction Heating Data Sheet CEN. INDUCTION HEATING CORP., 389 Lafayette St., New York, N. Y.

Infrared Finishing. A 12-page bulletin discusses the finishing of industrial products, using infrared radiation to accelerate drying. *New Facts about Infra-Red Bulletin CEN.* AULT & WIBORG CORP. SUBSIDIARY OF INTERCHEMICAL CORP., 75 Varick St., New York, N. Y.

Perbunan. A 36-page manual gives information on compounding and processing Perbunan. Also covered are softeners, pigments, accelerators, mixtures with rubber and other polymers, specific properties, and product compounding. *Perbunan Compounding and Processing Manual CEN.* STANCO DISTRIBUTORS, INC., CHEMICAL PRODUCTS DEPT., 26 Broadway, New York, N. Y.

Piston Pumps. This 4-page bulletin describes a line of horizontal piston pumps available for boiler feed or light-pressure service. *Bulletin 230–1 CEN.* WARREN STEAM PUMP CO., INC., Warren, Mass.

Plastics Testing. Equipment for testing tensile and compressive strengths, flexure, stiffness, resistance to impact, flow, and distortion is detailed in this 16-page booklet. *Bulletin 23 CEN.* TINIUS OLSEN TESTING MACHINE CO., 500 North 12th St., Philadelphia, Penna.

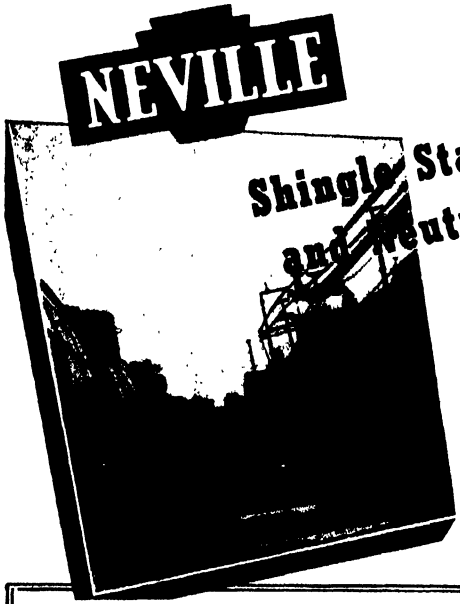
Potentiometer Temperature Indicators and Indicating Resistance Thermometers are described in an illustrated bulletin. Included are single-point and multiple-point models and those equipped with selective key switches for as many as 82 contact points, as well as the popular portable models. A complete list of standard ranges is given. *Bulletin A-305 CEN.* FOXBORO CO., Foxboro, Mass.

Pour-Point Depressant. A depressant developed primarily for use in heavy wax-bearing paraffinic-type lubricating oils is described in a 10-page file size booklet. It is claimed that, through the use of this product, the pour-point may be lowered as much as 50° F. *Application Data Bulletin 120 CEN.* MONSANTO CHEMICAL CO., St. Louis, Mo.

Pressure Recorder. A 32-page catalog describes the Foxboro line of pressure recorders, with list of standard ranges and reproductions of specimen charts. *Catalog 22-A-CEN.* THE FOXBORO CO., Foxboro, Mass.

Pressure Seal. This 4-page bulletin covers a mechanical seal for rotating shafts. The packing used is made of synthetic rubber. A table of dimensions is given. *Bulletin 1 CEN.* STEVENSON ENGINEERING CORP., 45 Willard Ave., Providence, R. I.

Process for Blackening Copper and Its Alloys. A 4-page folder describes a new process called Ebonol C for direct, simple, low-temperature blackening of copper and copper alloys, including bronze and brass. The characteristics of the coating obtained and the procedure used, as well as other blackening processes are discussed. *Folder CEN.* THE ENTHONE CO., 442 Elm St., New Haven, Conn.



Pulverizing and Separating Equipment. An 8-page bulletin describes equipment for pulverizing a wide range of materials. *Bulletin 52 CEN.* RAYMOND PULVERIZER DIV., COMBUSTION ENGINEERING CO., INC., 1315 North Branch St., Chicago, Ill.

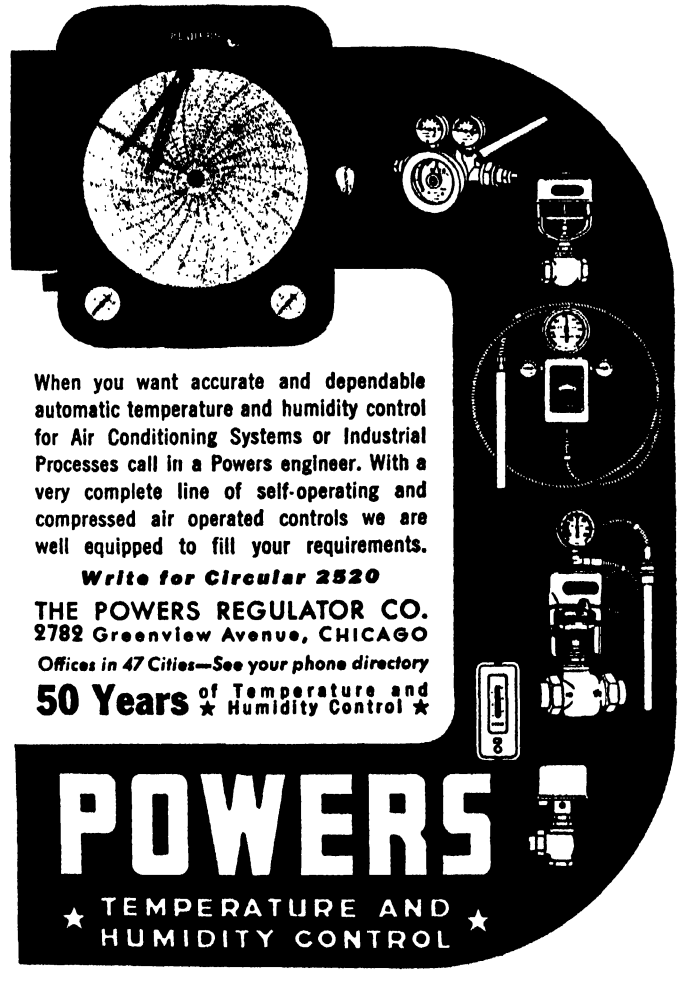
Refrigeration Valves and Fittings. This illustrated folder gives a brief description of semisteel valves and fittings designed for use with refrigerants. *Bulletin 191-A CEN.* FRICK CO., Waynesboro, Penna.

Safety Equipment. This 114-page illustrated catalog lists first aid, respiratory, gas alarm, electrical and high-temperature garment equipment. *Catalog 6 CEN.* DAVIS EMERGENCY EQUIPMENT CO., INC., 45–57 Halleck St., Newark, N. J.

Safety Equipment. This 8-page bulletin lists helmets, respirators, protective garments, etc., used in industrial plants. A folding stretcher and a wood traction splint are announced as new items. *Bulletin G-5 CEN.* MINE SAFETY APPLIANCES CO., Braddock, Thomas, and Meade Streets., Pittsburgh, Penna.

Synthetic Rubber Sponge. Ameripol synthetic rubber sponge is described in this 4-page catalog. Among its character-

CLEAR, clean dark red oils. Non-corrosive and of low volatility



NEVILLE SHINGLE STAIN OIL is suitable for thinning low cost high-baking japans. It is an excellent vehicle for pigmented shingle stains.

NEVILLE NEUTRAL OIL serves as cut-back solvent for tars, asphalts, and other bitumens. Important as inexpensive vehicle for tar acids, or cut-back solvent for tar acid oils, in manufacture of emulsifying-type coal-tar disinfectants, cattle and sheep dips.

● *Inquiries solicited for drums and tank cars. Send for complete brief leaflet "Neville Coal-Tar Products."*

istics said to be superior to those of natural sponge rubber are resistance to oils and fats, oxidizing influence of metallic soaps, hydrocarbons, and heat. A table compares the properties of Ameripol sponge with natural rubber sponge. *Catalog Section 8010 CEN.* B. F. GOODRICH CO., Akron, Ohio.

Temperature Indicators. Potentiometer-type units are described in a 16-page bulletin. Single- and multiple-point panel and portable models are covered. *Bulletin A-305 CEN.* FOXBORO CO., Foxboro, Mass.

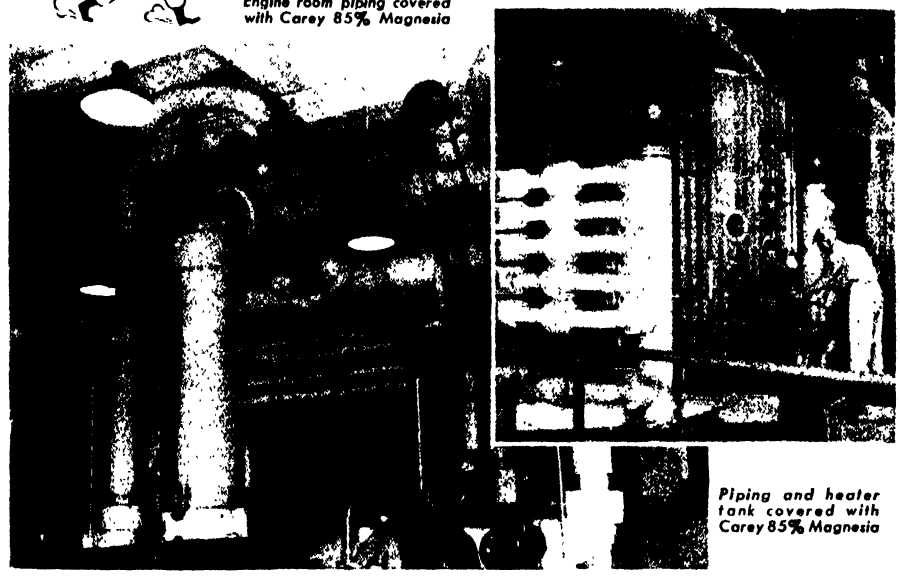
Variable-Speed Drives. Variation of machine speed through the use of changeable-pitch sheaves is discussed in this 16-page bulletin. Variation to 25 per cent can be obtained through the use of one sheave or to 50 per cent with two sheaves. *Bulletin B6082-A CEN.* ALLIS-CHALMERS MFG. CO., Milwaukee, Wis.

Votator. A 24-page booklet describes a heat exchanger which may be used to aerate, mix, or emulsify liquid passing through it. Viscous liquids may be handled. *The Votator CEN.* GIRDLER CORP., VOTATOR DIV., Louisville, Ky.

Metal Booster Pump

DESIGNED for use with forepumps having low volumetric efficiency at pressures below 1 mm. of mercury, a new high-capacity metal vacuum pump, known as the metal booster pump, Type MB-200, has been announced by Distillation Products, Inc., Rochester, N. Y.

This 2-stage oil diffusion unit will boost the pumping speed to 200 l/s. and will carry the vacuum from 0.5 to 5 × 10^{-5} mm. of mercury.



The unit is small and compact, and is readily connected to large mechanical pumps. The vacuum attainable is sufficient for metal sputtering and evaporation, ultracentrifuges, vacuum-insulated flasks, and drying chambers.

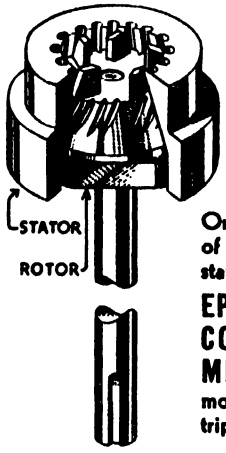
Carey HEAT INSULATIONS

HELPING PRODUCE SWEETS ECONOMICALLY for America at War!

Engine room piping covered with Carey 85% Magnesia

Piping and heater tank covered with Carey 85% Magnesia

The American Molasses Company, Brooklyn, N. Y., manufacturer of molasses and syrups of many kinds, is doing its bit to meet the nation's urgent "sweets" requirements. Their Grandma's Molasses is rich in nature's iron—needed in the daily diet to help build buoyant health, the goal of the National Nutrition Program. In processing the raw materials brought by boat from the West Indies and other sources, CAREY INSULATIONS are performing an essential service.



Because of the exposed location of the company's plant, correct insulation of the long, low-pressure steam lines going to the processing machines, is necessary to prevent excessive heat losses. These lines, together with the high pressure steam piping, are insulated with CAREY 85% Magnesia. Referring to this insulation, Mr. John Dobson, the Company's chief engineer, says: "No repairs whatsoever have been necessary on the Carey Insulation during the six-year period it has been in use; it looks good for another 20 years."

When you buy insulations, look for permanence as well as efficiency. CAREY insulations provide BOTH in outstanding measure, as demonstrated in many of the nation's leading industrial and power plants. Whatever your insulation needs, you're SAFE with CAREY. A national organization is at your service. For details address Dept. 64.

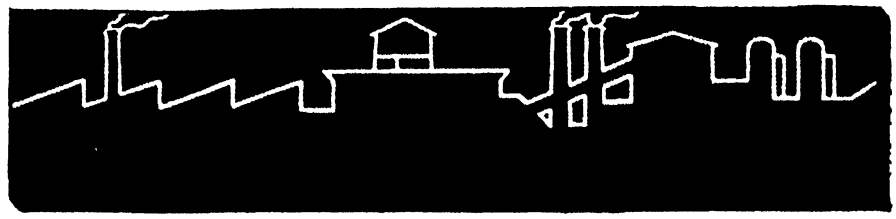
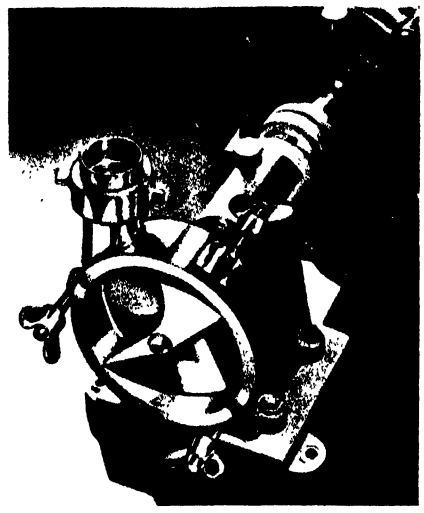
GREATER PROFIT!

Original design of rotor and stator in
EPPENBACH COLLOIDAL MILL assures more efficient triple action.



AMAZING RESULTS have been achieved with the Eppenbach Colloidal Mills. Products, as wide apart as emulsions, serums, lipsticks, rubber compounds, have acquired new, improved qualities, because the Eppenbach is so far ahead in its triple action.



It's more powerful, the mixing turbines break liquids more violently. Clearances can be so finely adjusted, they seem practically closed. The teeth in the rotor and stator shear the materials mechanically — then the smooth surfaces hydraulically shear to any required particle size.

Perfect control is assured. No air is sucked in. Micrometric adjustments are made without stopping. Water jackets provide right temperatures. Rotor is only moving part — and it's conically shaped to take up wear. Self-cleaning, simple, rugged. *Write us.*

EPPENBACH INC.
PROCESSING EQUIPMENT
FOR OVER 29 YEARS

Centrifugal Pump

THE Tri-Clover Machine Co., Kenosha, Wis., announces that a rubber manufacturer has achieved astonishing results with its centrifugal pump, which was originally designed to handle milk, sirups, chemicals, and foods with a minimum of agitation. According to this manufacturer's experiences, it is the first time that he has found a pump that will pump latex of 30 per cent concentration, or higher, with no resultant ill effects.

Two features stood out—the ease of handling the latex without shock and the ease of cleaning, which required only a few minutes of flushing with water.

Peerless Pump Co. Expansion

THE Peerless Pump Division of the Food Machinery Corp., Los Angeles, Calif., and Canton, Ohio, has acquired the Sterling Pump Corp., Hamilton, Ohio, and Stockton, Calif. The Hamilton plant will be consolidated with the new Peerless plant at Canton, Ohio, and the Stockton plant will be merged with the John Bean Manufacturing Co., Division of the Food Machinery Corp., San Jose, Calif.

New Types of Hydrocarbon Wax

THREE new types of hydrocarbon wax have been developed by Phosphate Division of Monsanto Chemical Co., St. Louis, Mo. The new materials are supplements to Santowax regular, and two of them have unusually high melting points and stability to heat. The products are designated as Santowax M, O, and P.

Preliminary investigations indicate they may have usefulness in improving the stability of candles and other formed wax articles, as lubricants in specialized high-temperature service, in compounding polishes and waxes, and as plasticizers in coatings and finishes.

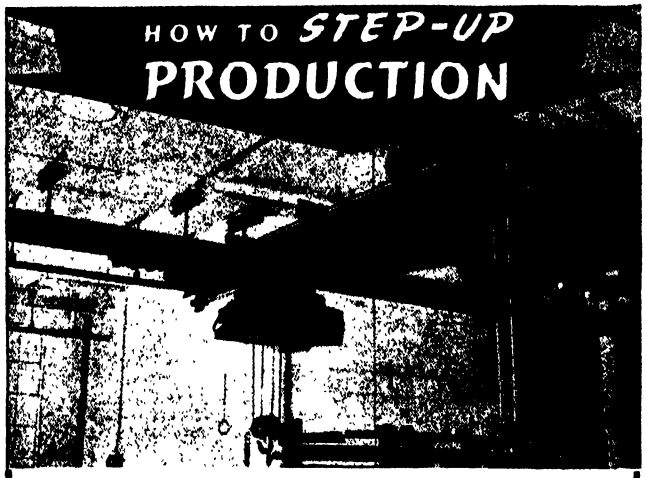
Santowax M is a microcrystalline wax with a melting point between 181° and 194° F. Santowax O is an oily crystalline material with a melting point of less than 122° F. Santowax P is a nearly white crystalline material with a melting point around 410° F.

Plastic Wallboard Shapes

NEW extruded Tenite shapes for use with heavy wallboards and insulation materials such as Celotex are now available. They are designed to cover unsightly seams and joints. No nails, adhesives, or other means of attachment are necessary in installation. The resilient Tenite strips are so shaped that they become automatically secured when forced into the seams. Strips are provided for inside and outside corners, flat panels, and 130° panels. Tenite comes in all colors and has a smooth lustrous surface, eliminating any need for paint or lacquer finishes. The strips lend themselves readily to wall and ceiling constructions and offer possibilities for use in prefabricated and semiprefabricated houses. At present the shapes are stocked in red only and in 12-foot lengths. White is expected to be carried in stock shortly, but any desired color may be had upon special order.

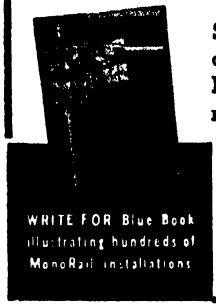
The strips are extruded by Extruded Plastics, Inc., Norwalk, Conn., from a cellulose acetate butyrate formula of Tenite manufactured by Tennessee Eastman Corp., Kingsport, Tenn. They are distributed by Julius Blum & Co., Inc., 532 West 22nd St , New York, N. Y.

Plastic Cup



A SMALL cup of Plastacele cellulose acetate plastic, together with an oxide solvent, is being used for quick loosening of frozen studs in a cylinder head, according to the du Pont company, Wilmington, Del. Cylinder heads badly corroded with heat-hardened rust formations often are broken or damaged in removal, and four to six hours sometimes are required to pry loose the frozen studs.

The plastic cup is attached to the stud and solvent is poured in. It trickles down through tiny holes in the bottom of the cup. The cup is transparent, permitting a full view of operations which indicate how fast the solvent is used. It is not affected by the solution and is shatter-resistant and easily cleaned. The cups are made in two thread sizes to fit standard $^{7}/_{16}$-inch and $^{9}/_{8}$-inch studs. The cups are injection molded by Caldwell Products, Inc., for Anti-Rust Corp. Plastacele molding powder is produced by du Pont.



Modern Fire Truck

A MODERN fire truck, manufactured under wartime regulations by the Cardox Corp., Chicago, Ill., is equipped with a refrigerated tank that holds 3 tons of liquid carbon dioxide. The truck is therefore independent of pumps, hose connections, water supplies, or water mains.

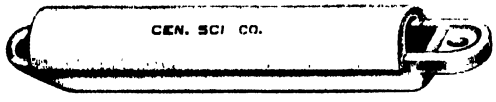
Barnstead Water Stills

Barnstead steam-heated Extra Duty Stills—the stills that are specially designed for distilling hard or badly contaminated water—are very easy to keep clean and efficient. The small stills—1 to 5 gallons per hour—have quickly removable Bayonet Type heaters. And the larger units have hand holes or trap doors with removable heating coils attached. With these features it is far easier to clean both the heating coils and the stills' interiors.



Other features worth noting are the constant bleeder device that prevents rapid scale formation—and the extra high evaporator to eliminate entrainment due to surging and foaming.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

CHEMIST: At least ten years' diversified industrial experience. Take complete charge modern industrial research and development laboratory for small, well-known, well established manufacturer of organic chemical specialties. New York City district. Good salary and bonus. Work includes special war production problems. All replies should give full data and will be held in strict confidence. No discrimination because of race, creed or color.
Box 17-N-4, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS, Chemical Engineering, University of Rochester, beginning September 1, completing M.S. program in one year. Stipend $700 plus tuition. Request further information or apply by sending complete personal data, photograph, transcript and two reference letters to Howard S. Gardner, Dept. of Engineering, University of Rochester, Rochester, New York.

CHEMICAL ENGINEER, American citizen, wanted for sales training in highly specialized technical field. Location, New York City. State age, draft status, education, experience and salary record. Enclose photo. Replies considered confidential.
Box 30-T-4, Ind. & Eng. Chem., Easton, Pa.

A LARGE pharmaceutical manufacturer is seeking a person to serve, after adequate training, as administrative manager of a manufacturing plant. In addition to a broad background in organic and pharmaceutical chemistry, he must have executive ability. Send a statement of education, experience and qualifications.
Box 71-TP-4, Ind. & Eng. Chem., Easton, Pa.

PROCESS ENGINEER. Company manufacturing processing machinery wants engineer of sufficient experience to take over the designing of Mixers, Kettles, Autoclaves, Attrition machinery and other process equipment. Location—Southern Ohio, and all organization executives are familiar with this ad. Excellent position for the future for proper experienced man.
Box 110-TP-4, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL MEN WANTED

Metallurgists, hydrometallurgists, and chemical engineers with milling experience, mechanical engineers, and welding engineers. For research on problems relating to war industries.

BATTELLE MEMORIAL INSTITUTE
COLUMBUS, OHIO

MUCILAGE and VISCOSITY research Chemist required to investigate substitutes of vegetable or synthetic origin. Properly educated, experienced man only
Box 21-NP-5, Ind. & Eng. Chem , Easton, Pa.

INSTRUMENT and APPARATUS Engineer with chemical, mechanical, and electrical experience for development department of laboratory supply concern. Experience in developing scientific laboratory equipment preferred. When submitting application, give full details of education, age, experience, salary expected. Personnel of this company have notice of this advertisement.
Box 13-NP-5, Ind. & Eng. Chem., Easton, Pa.

Chemist Wanted

Preferably experienced in shoe cements, finishes, etc. Write stating age, experience, technical education, salary wanted.

Box 14-NP-5 Ind. & Eng. Chem.

Easton, Pa.

CHEMIST or CHEMICAL Engineer having knowledge of and preferably experience in the production of synthetic rubber, particularly in the use of alcohol and waste agricultural materials therefore. Give complete information on education, experience and personal qualifications.
Box 16-N 5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer; preferably recent graduate with some experience in vegetable oil and soap analytical work wanted as assistant to Superintendent of an edible oil and soap factory in Honduras. Good climate and living accommodations. Single man preferred but no objection to married man. Applicant should have some knowledge of Spanish. Send recent snapshot, personal information and salary required.
Box 20-NP-5 Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL RESEARCH chemist to conduct development and research on pharmaceuticals and allied products. Give details of education, training, present and expected salary and personal data.
Box 24-NP-5, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS available for next year. Salary $540 for nine months' service. Part time laboratory teaching. Write for application blanks. H. D. Newton, Head, Department of Chemistry, University of Connecticut, Storrs, Connecticut.

CHEMIST WANTED: Recent graduate or graduate with a few years of experience, development work. Draft deferred. Chicago area.
Box 32-NP-5, Ind. & Eng. Chem., Easton, Pa.

TWO RECENT graduate chemists for analytical analysis in control laboratory of large Philadelphia chemical plant. Salary $2,150, per year.
Box 59-NP-5, Ind. & Eng. Chem., Easton, Pa.

Metallurgical Research

Engineer graduated in metallurgy preferably with some experience in research work alloy steels and steel specialties.

Box 48-NP-5, Ind. & Eng. Chem., Easton, Pa.

Processing Engineer

with metallurgical training wanted for improving existing steel mill practices; development of new production methods with view of increasing production and decreasing costs.

Box 49-NP-5, Ind. & Eng. Chem., Easton, Pa.

PATENT CHEMIST. Man with chemical or chemical engineering training for patent work as member of patent group of large chemical manufacturer. Previous patent experience not essential. Good technical training, ability to write clearly, and interest in specialization in patent work are important qualifications. Deferred draft status necessary. Please provide photograph and record of training and experience in first letter
Box 62-NP-5, Ind & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Man or woman, widely experienced. Background in analyses of raw materials and intermediates. Large concern, Northern New Jersey. State full qualifications and salary expected. Include recent photograph. Our employees are aware of this advertisement.
Box 63-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Must have several years experience preferably industrial equipment, to design, estimate and cooperate with field staff in sale of equipment used in power, municipal, process and manufacturing fields. Permanent job, not war time only. State detailed experience, present earnings. Confidential.
Box 64-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with about ten years experience in research, testing and practical commercial problems related to chemical engineering equipment. Established organization pre-eminent in its field has opening with excellent future for right candidate. Apply by letter, stating qualifications and salary desired.
Box 65 NP-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer with some actual experience in preparing and prosecuting patent applications and making patent searches wanted as assistant in patent department of research organization. Man preferred, but will consider woman. Age under 30. Give training, experience, nationality, marital and draft status, age, and other pertinent educational and personal data, also recent photo. Location northeast.
Box 69-N-5, Ind. & Eng. Chem., Easton, Pa.

PHYSICIAN-SCIENTIST, "research minded" with ability to direct and inspire personnel of Biological and Pharmaceutical laboratories. Splendid opportunity. Salary $7000–$8000. *Women* graduate chemists to detail physicians country-wide. Extroverts 25–30. Expenses and salary $30–$50. Everett Brown Agency, 17 John Street, New York, N. Y.

(Continued on page 645)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

GRAY HEADS — WISE MINDS

Leading Industrial Organization Invites Retired Men to Help Win the Battle of Production.

CHEMISTS • PHYSICISTS
CHEMICAL ENGINEERS

This message is addressed to men whose gray hair signifies years of service and experience in the field of physics and chemistry . . . men who under ordinary conditions would consider their life's work well done and be content with the ease and pleasures of retirement.

Today, many older men who are still able-bodied are anxious to leave their retirement . . . to go back to work and apply their experience and knowledge to help America build the materials of war.

To a limited number of such men, one of America's leading manufacturers, located in Eastern Pennsylvania, offers an opportunity to engage in research and development work in the fields of Chemistry, Physics, and Chemical Engineering. The men engaged will join the staff of a large and well-equipped laboratory. They will be active workers, not consultants.

IN APPLYING, PLEASE LIST THE FOLLOWING INFORMATION: 1. EXPERIENCE. 2. PRESENT LOCATION. 3. AGE AND PHYSICAL CONDITION. 4. SALARY REQUIRED.

Address

Box 78-NP-5, Ind. & Eng. Chem., Easton, Pa.

LARGE NEW YORK engineering firm requires chemical engineers age preferably 25-30 with any following experience: 1. Petroleum refinery experience in operation or design of stabilizers, absorbers and light end equipment. 2. Refinery experience in design or operation of plants for solvent dewaxing and solvent extraction of lube oils. 3. Refinery experience in design or operation thermal or catalytic cracking plants. In reply state education, qualifications and refinery experience in detail. Also salary expected and status regarding military service.
Box 80-NP-5, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST: Experience in coated fabrics. Location Midwest. State age, draft status, salary expected.
Box 81-NP-5, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST for pharmaceutical house. 3 to 5 years' experience in analytical chemistry. Able to develop analytical methods for newly synthesized organic compounds. Must be familiar with micro-analytical methods. Control on manufactured products. Competent to take charge of laboratory. Give full information. Plant located near New York City.
Box 90-NP-5, Ind & Eng. Chem., Easton, Pa.

ENGINEER

Trained and experienced in ceramics and glass, for manufacturing, engineering work on vacuum tubes. Direct war effort with large manufacturer of radio and special tubes.

Write stating age, education, experience, place of birth, attach snapshot (not returnable). Box 651, Suite 1800, Times Building, New York.

ANALYTICAL CHEMIST, BIOCHEMIST, CEREAL CHEMIST, CHEMICAL ENGINEER, FOOD TECHNOLOGIST, ORGANIC CHEMIST, PHYSICAL CHEMIST. Consideration will be given to applications from Bachelors, Masters, Ph.D.'s and those with a few years' post-doctorate experience. These openings represent opportunities for qualified persons in the Research Laboratories of a prominent food organization located in the East. Applicants should submit educational history, college record, experience, age, and other personal data, and recent photograph.
Box 100-TP-4, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

CHEMIST — PLANT Executive. 25 years' experience. Full responsibility for plant operation, maintenance, chemical control and pilot plant development. Experience covers wide variety of chemical processes and equipment. Developed two new products now being marketed. Expert analytical chemist. Interested in supervision of manufacture or laboratory.
Box 52-N-3, Ind. & Eng. Chem., Easton, Pa.

PROFESSORSHIP, by Ph.D. Ten years' teaching experience, chiefly general, some physical, organic, analytical. Five years' experience in industrial research laboratory where now employed. Age 36, married, four children, Protestant, honorary societies. South preferred.
Box 24-T-3, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT and RESEARCH chemist with exceptional training and experience. Ability to initiate and direct research problems with sound judgment and resourcefulness. 17 years' highly successful record in heavy chemicals, petroleum, high pressure gases and catalytic processes. Desire responsible position here or in Latin America.
Box 50-T-3, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Thirteen years' experience in research, development, and production on nitrogen, chlorine, and sulfur compounds, poisonous and volatile gases, and high pressure catalytic synthesis. Expert in training personnel and starting new plants.
Box 54-T-3, Ind. & Eng. Chem., Easton, Pa.

THOROUGHLY TRAINED chemist. M.S. Iowa State; B.S., Ph.D. Cornell. Research: plant pigments, vitamins, bioassays, balance studies, feed and food analyses, mineral nutrition. Experience; two years' industrial, one year head of chemistry department small college. Phi Kappa Phi. 26, married. Desires teaching with opportunity for research.
Box 66-T-3, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist. M.S. leading University. Young, personable, responsible. Excellent organic training. Research and industrial experience. Desires organic research position in a metropolitan area, preferably New York or Chicago. Presently employed.
Box 14-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, M.S. in Physical Chemistry. Two years' graduate work toward Ph.D. with research in Ceramics and high temperature physical chemistry. Experience in physico-chemical measurements, refractories, electrode-potentials, use of petrographic microscope, X-ray, spectroscope. Excellent record, references. Favorable draft status.
Box 35-N-4, Ind. & Eng. Chem., Easton, Pa.

SUMMER TEACHING position desired by assistant professor at accredited eastern college. Ph.D. 34 years' old. Will teach general, analytical or physical chemistry. Eastern location. Will consider permanent position with opportunity for advancement.
Box 58-N-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. Available June 1. Graduate research with organometallics at leading midwest university. 3 years' teaching experience, desires to go into organic research in industry. Some experience with dyes, organic syntheses. Single, 23, Protestant, draft 2-A. Location immaterial. Now located in Iowa.
Box 66-N-4, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1942 (June). Vitamins and nutrition. Good foundation in organic and physical chemistry and physiology. Research on vitamin B complex and protein requirements. Publications. Five years' teaching biochemistry, general and physical chemistry. Desires research or teaching.
Box 69-N-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, Bacteriologist. A.B., 16 years' experience in foods, biological and bacteriological products, plant management including production, maintenance, personnel, and accounting. Successful research and sales records. Patent experience. Age 39, married, Protestant. Continental U. S. preferred.
Box 83-N-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH or DEVELOPMENT position desired, preferably on the Pacific Coast or in Rocky Mountain States. Ph.D. in Physical and Inorganic Chemistry, University of Minnesota, 1930. Industrious worker. Eight years' experience in inorganic research; five years' teaching experience. Age 40.
Box 11-T-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT Chemist. B.S. in Chem. Fourteen years' diversified experience on plastics, synthetic resins, organic chemicals, paints, varnishes, cloth and paper coatings and process development. Excellent record and experience. East preferred. Available immediately. Draft deferred.
Box 18-T-4, Ind. & Eng. Chem., Easton, Pa.

TEACHER RESEARCH worker; Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, etc. Sixteen years' industrial research, consulting, testing. Numerous publications. Employed. Seeking broader field.
Box 22-T-4, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942. Available immediately. Research experience in organic synthesis and enzyme chemistry. Interested synthetic organic or biochemical research. Age 24, single, draft deferred. East preferred. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi.
Box 34-T-4, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT or ASSOCIATE professorship of organic chemistry in well established institution, beginning in September. Ph.D. prominent University, 1931. Eight years' department head in small mid-western University. Excellent record building up Department. Experience teaching undergraduate and graduate courses, directing M.S. researches, administration, placement, purchasing, glass blowing. Recent and projected publications based on M.S. theses. Sigma Xi, Phi Lambda Upsilon. Active A.C.S. section. Superior references. Protestant, age 37, married. Location immaterial.
Box 37-T-4, Ind. & Eng. Chem., Easton, Pa.

METALLURGICAL CHEMIST, M.S., June 1942. Inorganic major and physical metallurgy minor. Undergraduate research in organic; graduate research in inorganic. Summer experience in analytical chemistry. Experience with metallographic photomicroscope and X-ray diffraction equipment. Defense course in metal's inspection. Desires Southern California position.
Box 40-T-4, Ind. & Eng. Chem., Easton, Pa.

TEACHING POSITION, College, University or Technical Institute. Ph.D. from leading technical institute, experienced teacher. Research, many publications and patents covering 12 years industrial experience. Sigma Xi, Tau Beta Pi, Phi Lambda Upsilon, Pi Mu Epsilon. Age 35, married.
Box 48-T-4, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE with broad scientific training and administrative experience desires new connection with progressive and responsible organization. Ability proven through successful planning and directing technical projects. Market development a specialty. Familiar with heavy chemical manufacturing operations. Patents. Publications. Ph.D. Protestant. Married. Age 42.
Box 52-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. 1941. A.C.S. accredited university. Major biochemistry and organic. Desires position with industry engaged in defense work—research preferred. Presently employed as instructor in same university. Single, 24, assurance of draft deferment. Sigma Xi. Available June 1. Location immaterial.
Box 54-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry in liberal arts college, June 1942. Age 21. Training includes physical chemistry and organic analysis. Location immaterial. Available in June.
Box 55-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST M.S. Accredited eastern university. Fellowship. Organic major, but thoroughly trained in physical, inorganic, analysis. Desires research or production position, preferably in east. Available middle of May, 1942. Single.
Box 56-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. desires responsible position with financially sound and progressive company. 25 years experience in production, control, development, vacuum processing milk and food products. Knowledge of vitamin fortification and food laws.
Box 81-T-4, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PROFESSOR of organic and analytical desires position in essential industry or teaching position in a department interested in developing chemists. Ph.D., M.S. in organic physical minor, recent research in nonferrous electrochemistry. Sigma Xi, Phi Lambda Upsilon, publications. Protestant, married, age 29. Philadelphia area preferred, but will go anywhere, including South America.
Box 91-T-4, Ind. & Eng. Chem., Easton, Pa.

RESEARCH PHARMACEUTICAL organic chemist, Ph.D., 1941, large mid-western university. Research experience in organic syntheses, sulfur and nitrogen compounds, vitamins. Publication. Member Sigma Xi, Phi Lambda Upsilon, Rho Chi, age 27, married, draft 2-A. Now employed, but desires new connection where his abilities can be utilized fully. Available upon short notice.
Box 96-T-4, Ind & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. Broad knowledge of all branches related to biological chemistry. For many years directing biochemical and biological research in the field of hormones, enzymes and vitamins. Special experience in protein chemistry. Numerous publications, member of several scientific societies. At present employed. Desires responsible position in research laboratory.
Box 118-T-4, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 646)

(Situations Wanted Continued)

PHYSICS-ORGANIC Chemist, Ph.D., 1941 organic chemistry. Presently Research Associate in well-known Eastern university. Work for past three years has been of a general catalytic nature. Publications. Capable glass-blower. Wide experience in analytical chemistry. Age 26, single, draft deferred. Desires research position involving application of catalysis to organic problems.
Box 10-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1939 with minors in biochemistry and physical, now teaching in a western university desires full time research position. East preferred. Married, age 32. Available June 1942.
Box 11-N-5, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST, PHYSICIST, chemist, age 37, broad experience as executive and industrial engineer. Qualify as director of research for the development of processes, layout, installations, operations, fabrication, foundry practice, ferrous and nonferrous alloys, welding, heat treating. Manufacture and use of industrial x-ray equipment as well as radium. Interested in occupational change with definite opportunity for future. West Coast preferred. Draft classification 3-A. Salary, minimum ten thousand.
Box 12-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, EXCELLENT background. 8 yrs. varied chemical experience. Age 27. Research publications in physical, organic, analytical, and biochemistry. M.S. physical and organic. Phi Lambda Upsilon. Year chemistry teaching. Industrial testing and control experience. Employed. Out of town offers invited.
Box 15-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., June 1942, Eastern University. Desires organic research in any field with a progressive industrial firm. Thorough training in Organic and Physical Chemistry, and Bacteriology. Research experience in Organic Synthesis, Nitrogen Heterocycles, Medicinals, Endocrinology. Available immediately. Location immaterial.
Box 17-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, 7 years' general industrial research new products, especially synthetic resins, coatings, intermediates and plasticisers; drying oils and derivatives. Patents, publications on polymerization. Age 28. Employed. 3A.
Box 19-N-5, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL ORGANIC chemist. Degrees from recognized Universities. Young doctoral candidate. At present employed in a responsible research and supervisory position with an essential non-defense industry. Wide background includes teaching experience. Available on short notice. New York City vicinity preferred.
Box 23-N-5, Ind. & Eng. Chem., Easton, Pa.

INORGANIC CHEMIST. Ph.D. Over twenty years' college teaching experience, chiefly inorganic and analytical chemistry. Consulting, research and administrative experience. Age 42. Married. Honor societies. Publications. Interested in research, industrial or teaching position. Immediately available.
Box 26-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. from Western University May, 1942. 22, single, temporary draft deferred. Desires employment in explosives or petroleum fields. Teaching experience, location immaterial, high scholastic standing, available June.
Box 28-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: 18 years' practical experience. Desire responsible position. Prefer research or head of analytical group. Will complete work for Ph.D. 1942. Major inorganic analytical. Thorough training in organic and physical. Publications. Location immaterial but prefer East. Available June.
Box 29-N-5, Ind. & Eng. Chem., Easton, Pa.

WOMAN, Ph.D. 1938. Publication of independent research in electro-organic synthesis. Two years' experience teaching successfully general, analytical, organic, and foods chemistry in accredited college. Desires responsible teaching or industrial position. Now teaching. Excellent references. Middle-west preferred.
Box 31-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. June, Eastern University. Minor, physical chemistry. Research on isolation and synthesis of natural product. Research experience in biochemistry. Graduate assistantship, Phi Lambda Upsilon, Sigma Xi. Single, age 25, draft classification 2-A. Desires industrial research or teaching.
Box 34-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. course work and research completed. Physical chemistry minor. Publications. Four years' teaching general and organic. Eastern location preferred but not essential. Draft deferred. Available in June.
Box 35-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Ph.D. June 1942, eastern university. Research experience in natural products, carbohydrates, proteins, nitrogen compounds, and organic synthesis. Teaching experience. Desires position in organic or biochemical research. 25, single, draft deferred. Phi Lamba Upsilon, Sigma Xi, publications.
Box 36-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST. M.S. in June from large midwestern university. Thorough knowledge of organic, inorganic, physical and chem. eng. Research in organometallics. Some experience. Single, 24. Chicago area location preferred.
Box 37-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER Univ. of Mich. '33. Available for position in war industry. Principle experience heavy chemical plant operation, construction, development.
Box 38-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry with minor in engineering. Brooklyn Polytechnic graduate with one year industrial experience seeks job in defense plant or laboratory. Organic position preferred. Now employed but available after May. Eastern location preferred. Phi Lambda Upsilon.
Box 40-N-5, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST, married, 42, dependents. Seventeen years' experience canning, freezing, waste disposal, production management and research. Graduate chemical engineer.
Box 41-N-5, Ind. & Eng. Chem., Easton, Pa.

WAR PRODUCTION work wanted by unemployed chemical engineer with twenty years' experience in plant development and supervising thirty to three hundred employees, chiefly along organic synthetic, solvent, plastics, acid handling and collateral inorganic lines. Accustomed full responsibility, married, American ancestry, Protestant, patents, publications, references.
Box 42-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., desires responsible position in research and development with progressive company. Resourceful and creative, backed by large experience in varied fields, rubber included. 8 years' industrial research, development, sales promotion. Owner of chemical library.
Box 43-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry, large midwestern university 1941. Physical, organic, analytical, and biochemistry. Knowledge of German and French. Understand engineering. Age 22, single, citizen, Protestant, A.C.S. member. Have pleasing personality, able to meet and handle people. Engaged at present in research, and have done original research in own laboratory. Desire stable position with good future in small or medium sized firm actively engaged in national defense work. Location must be in Chicago.
Box 46-N-5, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST, Ph.D., 1942 with research on deteriorative changes in glass-packed fruit juices. Biochemistry, organic, bacteriology, and food technology minors. Experience in vitamin determinations: animal, chemical, and microbiological. Interested in glass-packed food research problems especially. East preferred. Age 25, single. Protestant. Phi Kappa Phi, Sigma Xi. Held teaching and research fellowships. Publication.
Box 47-N-5, Ind. & Eng. Chem., Easton, Pa.

PHARMACIST-CHEMIST, Phm.B. (pharmacy), B.Sc. and M.Sc. (chemistry); interested in pharmaceutical research, analysis, and new product development; training in mfg. pharmacy, ampuls, tablets, organic chemistry, bacteriology, bio-assay, pharmaceutical analysis; twenty months' experience as chief chemist of small pharmaceutical house; keen student of scientific literature pertinent to medical sciences. Seeking responsible position offering greater opportunity. Age 30, single, 2A deferment, Canadian, first papers for U. S. citizenship.
Box 52-N-5, Ind. & Eng. Chem., Easton, Pa.

SUMMER EMPLOYMENT wanted. Now instructor on permanent basis in General Chemistry at state university. Ph.D. 1938. Major, Biochemistry; Minor, Organic Chemistry. Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi. Research experience. Draft classification 2B. Single, Age 28. Location immaterial. Available June 8.
Box 53-N-5, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH Chemist, M.Sc., 38, married, 15 years exp. whereof 10 in coal, gas, coke and by-products in charge of analytical and research laboratory and research pilot plant and as supervisor of producing plant of big Gas Works. Also Fats and Oils. Process development. Publications. Now in organic research. Location immaterial.
Box 54-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.A. 1940. Diketones, pyrans, olefins. Publication, teaching. Year's successful research with vegetable processor. Year as Government Analyst. Draft 3-A. Prefer research and development in Southern California, but consider anywhere.
Box 55-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S. Interested in research or development position with progressive company in war industry. Graduate A. C. S. accredited college. 2½ years' industrial experience physical and special analytical techniques. Married, 26. Draft status 3A.
Box 56-N-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: CHEMICAL research work in Rocky Mt. region. B.S., M.S. (1915), 2 yrs. toward Ph.D. Now employed. Twenty yrs. research experience in coal tar field. Would accept nominal salary for position offering advancement.
Box 58-N-5, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT, Ph.D. Organic major, Physical minor. Excellent scholastic record, Phi Beta Kappa, etc. Four yrs. varied industrial research with large organization including organic synthesis, high polymers, plastics and process development. Now employed. Desire position in research and/or development. Married. Protestant.
Box 60-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in Chemistry, June, 1942. Will have also completed some graduate work at this date. Excellent basic training in organic, analytical and rubber chemistry, math. and physics. Prefer position as organic research assistant or work connected with rubber compounding. Available by mid-June. Location immaterial.
Box 61-N-5, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR desires new location. 8 years experience developing inorganic pigments, heavy chemicals, metal recovery processes, and analytical research. Numerous publications, patents, book. Location immaterial. American. Draft deferred. Married. Presently employed by nationally known concern, available on short notice. Desire $5000 minimum.
Box 67-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, WISHES research position. B.S. large mid-western university, 1940. Academic and industrial research experience: inorganic, synthetic resins. Chicago vicinity preferred. Draft exempt. 24, Gentile.
Box 68-N-5, Ind. & Eng. Chem., Easton, Pa.

KNOWN INDUSTRIAL Chemist, D.Sc., Ch.E., specialist in mustard-gas proof materials for textiles, leather, pharmaceutical; 20 years experience in research and development of own and other patents; various plastics introduced in main industries, for instance aircraft industry, wants position in a progressive company, preferably as consultant, also willing to bring in own patent rights.
Box 73-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST; B.S.; Two years' experience in industrial laboratory and pilot plant research and product development. Have developed new product and unit process technique. Interested in position in industrial organic research laboratory. Presently employed. Draft Deferred.
Box 75-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER; Two years' experience in distilling industry. Advanced training in unit operations and organic chemistry. Have performed work of a responsible nature. Age 24. Presently employed.
Box 76-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: M.I.T. graduate with twenty years' diversified experience directing (often as consultant) research and development on products, processes and equipment; developing design and initial operation of million dollar plants; solving unusual production problems; increasing morale and efficiency of men. Recently in pulp and paper; earlier in rubber chemicals, coal gasification, coatings.
Box 82-N-5, Ind. & Eng. Chem., Easton, Pa.

ELECTRO-CHEMIST, M.S. with further graduate work equivalent to Ph.D. (Electrochemistry major). B.S. in Chem. Eng. Six years' successful research and development work in electroplating and metal finishing, including bright nickel, high speed tin, copper and nickel, noble metals, alloy plating including brass and silver alloys, etc. Plant experience. Proven ability. Possesses initiative and ability to work with people. Publications and patent. Age 32, employed, 3A.
Box 86-N-5, Ind. & Eng. Chem., Easton, Pa.

AGRICULTURAL and BIOLOGICAL Chemist, B.S. 1938, Pennsylvania State College. Research in Agr. Exp. Sta. Industrial experience in food and dairy chemistry and bacteriology. Draft deferred, age 24, married.
Box 87-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. 1937. Seven years' experience laboratory and plant research and development, plant yield studies, development of control chemistry, experimental equipment design, pilot plant supervision and maintenance, and trouble shooting in organic chemical field. Patent pending. Employed, but desire opportunity and more responsibility. Age 28, Protestant, native American, married, 3-A.
Box 89-N-5, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 647)

(Situations Wanted Continued)

COLLOID CHEMIST M.S. engineering '41. 5 years' experience in inorganic colloids, plastics, wetting agents, corrosion, and rubber. Age 28, married, draft 3-A. Employed. Desire research and development position.
Box 91-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., desires position in industrial research. Experience: Development of pharmaceuticals, research on phenols, sterols, amino-acids, vitamins. Organic synthesis and analysis. Familiar with organic micro-technique, spectrophotometric and micro-biological work. Publications. Draft deferred, dependency.
Box 96-N-5, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER, degree. Four years' food technology and development, mostly prepared cereals. Now production manager for food company with large national business. Two years' research and control of electrotyping solutions. Receptive to offers from other fields Married, 3 children, age 27.
Box 12-T-4, Ind. & Eng. Chem., Easton, Pa.

PLANT SUPERINTENDENT, experienced in design, erection, operation and technical direction of vegetable oil plant manufacturing refined and hydrogenated oils, Oleomargine, Mayonnaise, Distilled Fatty Acids and Crude Glycerine.
Box 44-T-4, Ind. & Eng. Chem., Easton, Pa.

LIBRARIAN for industrial or commercial research department. Young woman. Phi Beta Kappa. University graduate; library school trained. Science major, including chemistry, bacteriology, biology. Literary ability. Knows German, French, Spanish, typing. Location immaterial.
Box 50-T-4, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, age 45. Thoroughly experienced, practical analysis of metals, ores, silicates, gas, water, chemicals, commercial organic materials. Now employed near Philadelphia. Seeks new connection offering permanency of employment at moderate pay.
Box 57-T-4, Ind. & Eng. Chem., Easton, Pa.

EMPLOYMENT in BRAZIL wanted either as chemist or in management. A.B. 1934 Stanford, chemistry major. No experience. Seven years manager wholesale oil distribution. Consistent money making record. Speak Spanish. Read Spanish, German, some French. Studying Portuguese. Alpha Chi Sigma. Age 29. Draft 1-B. Married. Excellent references. Salary immaterial.
Box 25-N-5, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST: American born, graduates with B.S. degree, May 26, 1942. Desires analytical chemistry position in industry. 36 semester hours in chemistry, including quantitative, organic, organic qualitative, and physical. Location immaterial.
Box 30-N-5, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST (Organic) M.S. from midwestern university. One year toward Ph.D. Experience college teaching and bibliographic research. Graduate assistant and fellow in chemistry three years. Stenographic experience. Read Spanish, French, German. Thorough training in physical chemistry, physics, mathematics. Sigma Xi. References. Desired industrial position, location immaterial. Available June.
Box 33-N-5, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL and RESEARCH chemist, Checkoslovakian college graduate, 4 years in U.S.A., first citizenship papers, 2 years assistant at college, 20 years broad experience, age 44, married. Presently employed, change due to priorities, restrictions. Very capable worker, excellent references.
Box 39-N-5, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and INDUSTRIAL chemist, Ph.D. organic, university Vienna, excellent experience, many patents, seeks position.
Box 45-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. June, 1942. Suitably trained for position in rubber industry. 8 years' factory experience. Formal university training in chemistry of rubber—natural and synthetic. Single, 2A.
Box 51-N-5, Ind. & Eng. Chem., Easton, Pa.

Industrial News

Abraser Vacuum Pickup

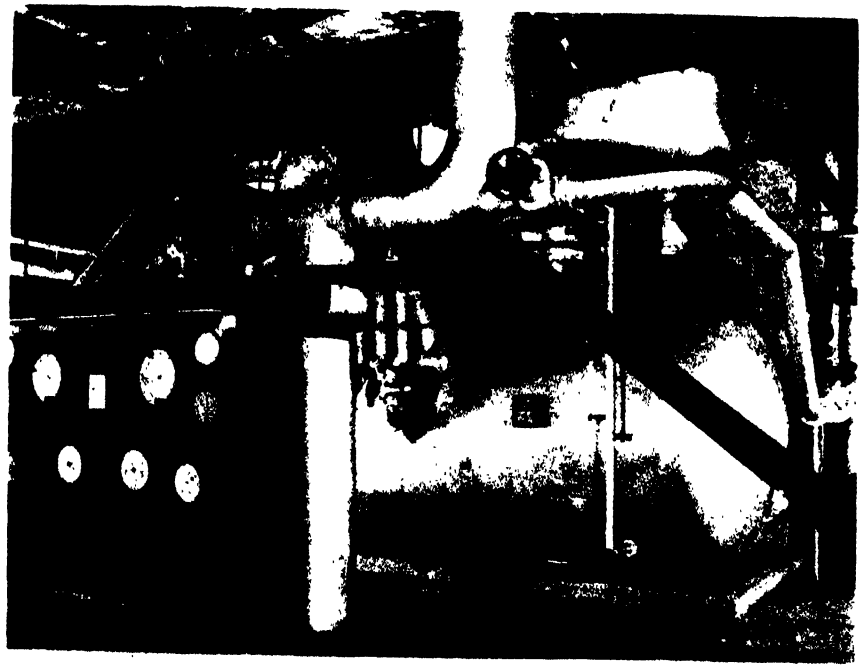
THE Taber Instrument Corp., North Tonawanda, N. Y., has announced its improved Abraser Vacuum Pickup, Model HV-42, an accessory to the Taber Abraser standard method for measuring resistance to abrasion of surface finishes.

Its primary function is to prevent accumulation of abradings from interfering with the normal wear action of the Calibrase wheels. Its principal application is for the removal of abradings that may become imbedded in the weave of textile fabrics, or the fine powder from certain types of organic coatings that tend to cling to and build up on the face of the wheels.

The pickup is of tubular design for standing on the table alongside the Abraser and has a nozzle rotatively mounted on the suction end of the housing. The contaminated air is drawn through the nozzle and connecting tube into the high-speed centrifugal pump, then through a special filter bag which passes only clean air back into the room.

THE Moore Products Co. has moved into its own building at H and Lycoming Streets, Philadelphia, Penna., which offers larger manufacturing facilities.

Deaeration of Boiler Feed Water



ATOMIZING deaerators spray the water and then atomize it by means of a steam jet to remove any remnant trace of oxygen. Trays, which may be fouled by high carbonate hardness, are eliminated in the deaerator design of the Cochrane Corp., 17th & Allegheny Avenue, Philadelphia, Penna.

The atomizing deaerator for stationary work is recommended where the water is turbid and contains carbonate hardness that might readily foul tray type deaerators and where the water to be deaerated is high in carbon dioxide (i. e., low in pH value), which might cause rapid deterioration of the cast-iron trays.

No differentiation is made between the atomizing deaerator and the tray type from the standpoint of performance.

A 400,000-pound-per-hour vertical unit was purchased by Michigan industrial plant instead of a tray type of heater on the basis of test results. With the installation of the atomizing type of unit the internal structures have been notably free of corrosion and deterioration, at the same time delivering zero oxygen water. Two 500,000-pound-per-hour atomizing deaerators are now operating in Texas and another 400,000-pound-per-hour unit has been installed in the Michigan industrial plant.

The Union Electric Light Co. of Missouri installation illustrated was recommended to deaerate 100 per cent make-up water previously treated through a cold process softener.

Storage tank for deaerated boiler feed is behind panel board; two atomizer units above. Four Cochrane flowmeters on panel board measure heating steam and feedwater flow.

WANTED: Nachweis und Bestimmung Organischen Verbindungen, Professor Hans Meyer, Prag, Publisher Julius Springer, Wien, 1933; Die Arbeitsmethoden der Organische Chemie, Houben-Weyl, 4 vols.; Synthese der Kohlenstoffverbindungen, Professor Hans Meyer, Prag, Publisher Julius Springer, 1933, 3 vols.; Journal of Biological Chemistry, vols. 100-118; Die Praxis des Organische Chemikers, Gottermann-Wieland, Publisher Walter de Gruyter, Berlin. State price, condition, edition.
Box 18-NP-5, Ind. & Eng. Chem., Easton, Pa.

MACHINERY WANTED: Autoclave, steel, 5 gallon, 2000 lb. work pressure.
Box 22-N-5, Ind. & Eng. Chem., Easton, Pa.

WE WILL place orders for special organics with chemist who has access to equipped laboratory. Wanted now Asparagine, Histidine, Hydrochloride, Aesculin, Acrylic acid, Tryptophane, Malic acid, Digitonin, Methionine, Lysine, Threonine, Lyxose, Levulose, Xylose.
Box 71-N-5, Ind. & Eng. Chem., Easton, Pa.

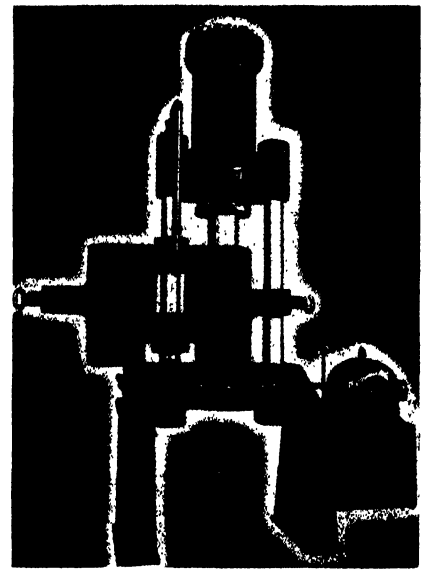
WANTED TO PURCHASE: General and Special equipment for steel-work analytical laboratory. State detailed inventory and cash prices.
Box 77-N-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: Glass lined tank approximately 7 ft. diameter by 3 ft. deep with top, and dished bottom, with outlet.
Box 83-N-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: "Chemical and Metallurgical Engineering": Vols. 4, 6, 7, 9, 10-16, paying $3, per volume; "Electrochemical and Metallurgical Industry": Vols. 4 (1906), 6 (1908), 7 (1909), 9 (1911), 10 (1912), paying $3, per volume; "Transactions (American) Electrochemical Society": Vols. 45-70, 74-79, or any; "Journal of Bacteriology" Vols. 1-30; "Journal of Research (Bureau of Standards)": Vols. 1-23; "Electronics": Vols. 1-12; "Chemical Abstracts": Vols. 4, 5. Dr. G. H. Franzius, 201 East 82nd Street, New York, N. Y.

WANTED IDEAS: Interested preferably in patents: realization of some wastes. Write offer with full details.
Box 95-N-5, Ind. & Eng. Chem., Easton, Pa.

Protection against Flying Glass



AS PROTECTION against flying glass during air raids, a coating for windows is offered by Douglas Distributors, Inc., New York, N. Y. The new coating, known as Protex shatterproof blackout coating No. 4, is applied with a brush to the inside of windows and makes them opaque for a year or more under normal conditions.

An outside blackout coating also being offered is sprayed or brushed on the outside of windows, forming a dense, flat black finish which is impervious to weather conditions. Investigation in England showed that fully 90 per cent of civilian casualties caused by Nazi bombs were attributable to flying debris, particularly glass.

Hydraulic Straining Press

A 200-ton-capacity hydraulic straining press, manufactured by The Watson-Stillman Co., Roselle, N. J., strains or filters fluids under a pressure of 2,000 pounds per square inch. The machine has two cylindrical containers, each 10 inches in diameter and 33 inches deep, mounted on a swinging arm so that one may be filled while the press strains material from the other.

The press is completely self-contained, including 20-h. p. motor, 18-g. p. m. pump, and oil tank. The entire unit stands 14 feet high and weighs 15,000 pounds.

Heating Equipment for Dryers

AN ESTIMATED 46,500 pounds of scrap metal has been released for war uses by the installation of new heating equipment for dryers in the plant of the John R. Evans & Co., Camden, N. J. In addition, this new equipment installed by the Carrier Corp., Syracuse, N. Y., has resulted in a considerable saving in motor horsepower, a slight decrease in the time required to dry hides, and an approximate saving of 5 per cent in steam consumption. Formerly the hides were moved through a 110-foot tunnel in which drying equipment consisted of fifteen 9-foot turbulence fans, driven by a 60-hp. motor from a shafting which ran the entire length of the dryer. This equipment was replaced by five Carrier heat-diffusing units, requiring only 25 hp. to circulate a large quantity of air.

Heat Transfer Calculator

THE Alco Products Division of American Locomotive Co., New York, has made available, at cost (25 cents), a limited number of mean temperature difference calculators devised to aid in the approximation of heat-transfer surfaces when preparing estimates or specifications for heat exchange equipment. The Alco calculator includes scales for the calculation of the logarithmic m. t. d., as well as the m. t. d. correction factors for one, two, three, four, and six shell passes, and also "C" and "D" scales which permit multiplication and division operations.

Substitute Fuels as a War Economy[1]

GUSTAV EGLOFF AND P. M. VAN ARSDELL
Universal Oil Products Co., Research Laboratories, Chicago, Ill.

With the advent of total war throughout the world, the problem of securing sufficient motor fuel of high quality has become vitally important. When the United States entered the war the oil supplies of the Axis group were a severe contrast to the United Nations, who control more than 90 per cent of the world's petroleum resources.

The world's oil consumers present a different aspect since the European continent was the second largest user of petroleum and its products before the war began. With the exception of Rumania, Poland, and Hungary, none of the nations under Axis domination have a petroleum industry sufficient to supply their needs, nor do they have motor fuel of as high quality as the United Nations. The European volume of the world's 2,250,736,000 barrels (*25*) of petroleum production in 1941 was less than 3 per cent. Consequently the major portion of the petroleum in those countries was previously imported.

The crude oil production of the world during 1941 is shown in Table I.

When the Axis Powers established domination of the European Continent, all oil production, storage, and refinery capacity was confiscated for the German military machine. During 1940–41 practically all of the oil-burning motors remaining in civilian use in Europe were converted to the gas-, coal-, and wood-burning type. Progress in building more plants for the manufacture of synthetic motor fuels also continued. The quantity of petroleum and substitute fuels produced throughout Axis Europe amounted to a maximum estimated volume of 11,268,000 barrels monthly and consisted of gasoline from petroleum, hydrogenated coal and water gas, compressed fuel gases, producer gas from wood, lignite, coal, and coke, and alcohol, benzol, and shale oil.

Until Axis control is established in some large oil-producing country, the need for greater quantities of substitute fuels will be present.

The Russian invasion has cost Germany about 21,250,000 barrels of oil and substitutes per month, of which at least 4,250,000 barrels must be used in maintaining communications and industry behind the battle lines. Germany is using oil and its substitutes at approximately double the rate of her production capacity, which is based on the maximum estimated output of the European Continent.

An estimate of the year's military operations on all European fronts by the Axis Powers called for over 255,000,000 barrels of fuel, of which Germany, Rumania, Poland, Albania, and other occupied countries produced only 53,501,000 (*25*) barrels of petroleum and substitute fuels of

all kinds equivalent to 81,720,630 barrels of fuel, or a total of 135,221,630 barrels. From a fuel production standpoint Axis Europe is short at about the rate of 120,000,000 barrels of oil per year, based on the Russian campaign.

From time to time the question arises as to the Axis defeat because of oil shortage. The European Continent is low in oil production, and to maintain a campaign based on the strategy of World War I would have depleted its oil resources. However, with modern blitz warfare the Western European campaign lasted but 45 days from invasion to capitulation. This 45-day war used about 12,500,000 barrels of oil and oil products, and the captured stores in the defeated countries were estimated at about 20,000,000 barrels (*13*). The remaining European campaigns lasted less than a year—about 284 days of actual fighting until the Russian invasion on June 22, 1941. Up to that date the actual expenditure of oil was less than had been expected, based on previous calculations of strategy. In contrast to the Western European campaign, the Russian campaign has cost about 32,000,000 barrels of oil in a similar 45-day period with no oil stores or production gained.

It has been reported that oil stocks in Germany were 59,500,000 barrels (*57*). But it is not clear what the German losses in actual capacity have been from aerial bombardment over Europe by the R. A. F and the Russian air force. From increasing frequency of bombing raids, the damage to Axis oil production should be relatively large.

A further indication of the prevailing European motor fuel situation is reflected in a news item in the *New York Times* on April 28, 1942, which points out that a system of gasoline barter for Italian prisoners was set up by the Yugoslav General Mikhailovitch. According to the dispatch, the system is one Italian soldier or noncommissioned officer for one can of gasoline, one Italian officer up to rank of colonel for four cans of gasoline, one Italian colonel for 50 cans of gasoline. These equivalents were considered unreasonable by the Italian Government but were finally accepted, thus allowing the General to fuel the tanks captured at the same time as the soldiers.

At the beginning of the war, September 1939, Europe had immense stores of crude oil and refined products, and a relatively large synthetic fuel production. The extent to which substitute fuels have been necessary is shown when acetylene, garbage, artichokes, ammonia, and hydrogen are considered suitable for motor fuels, and in the great increase in the number of gas generator (gasogene) and compressed gas vehicles during the past two years. It is naturally difficult during wartime censorship and propaganda activities to obtain reliable figures on Axis production and consumption of fuels and fuel substitutes. Data are presented in Tables II and III for maximum and minimum amounts reported by different esti-

ACME PHOTO

One of the halls of "the heart of Germany's war fuel industry", says the German censor-passed caption on this picture. The Leuna synthetic oil plants, greatest in Germany, have been bombed time and again by the British.

Producer gas	0 019 assuming 100 B. t. u./cu. ft.

mators of fuel substitutes produced. Probably both sets of figures are tinged with propaganda. The truth lies most likely somewhere between the two sets of data.

Tables II and III show the maximum and minimum fuel production statistics. Some figures are available only as late as 1939, while others are given for as late as December 1941. For either table, the data presented are estimates.

Composition Motor Fuel Efficiencies

On the technical side, the efficiency of the fuels produced as substitutes for the more desirable petroleum products has enforced some limitations on their general adaptability. While it is perfectly feasible to use the various substitutes, there are a number of drawbacks. In compressed gas, the weight of the tanks is a decided drain on efficiency. In alcohol fuels, separation occurs if water is present, and in the producer gas vehicle the fuel and the added weight on account of the retorts, coolers, etc., are a detriment to efficiency. In addition, an entire new driving and mechanical technique must be learned. Taking into account these major items, the heating quality of the gas is also a considerable item in its use. Table IV shows the heat content of the various fuel substitutes used in the countries without oil (*44*). The equivalents are based on one barrel of gasoline as a standard.

Coal Hydrogenation

Hydrogenation of coal by the Bergius, and carbon monoxide by the Fischer-Tropsch processes has formed the major source of substitute fuels in Germany. At the present time, in spite of the relatively large installations necessary for fuel

Table V. Hydrogenation (Bergius) Plants in Germany (28)

Plant	Date Placed in Operation	Place	Process	Production in Barrels 1938	1939	1940

Total				2,422,500	5,227,500	11,135,000
Total by I G. Farbenindustrie				8,467,500	12,112,000	24,225,000
Total of both I. G. Farbenindustrie and Fischer-Tropsch				10,890,000	17,339,500	35,360,000

production, the Bergius process has the largest production of synthetic oils.

During the years preceding the present war, considerable research was done on various hydrogenation processes, and a number of processes for production of oil from coal came into being. The data in Tables V and VI show the development (*28*) of 1939 through 1940 of Bergius and Fischer-Tropsch processes for the production of oil from coal, their location, capacities, and year production started. The data are incomplete as to the actual number of plants operating.

The total 1940 figures presented for the hydrogenation processes show that approximately two thirds of the synthetic oil is manufactured by the Bergius method. Table VI shows the same data for the Fischer-Tropsch process.

***Above.* Compressed gas cylinder racks. *Below.* The compressed steel cylinders**

An advantage of the Fischer-Tropsch plants (*68*) is that they may be operated efficiently on a much smaller scale than the direct coal hydrogenation plants operating on the Bergius process. Because of the possibility of decentralization of these plants, there is less danger from bombing, and even if a direct hit is scored there is less loss of capacity.

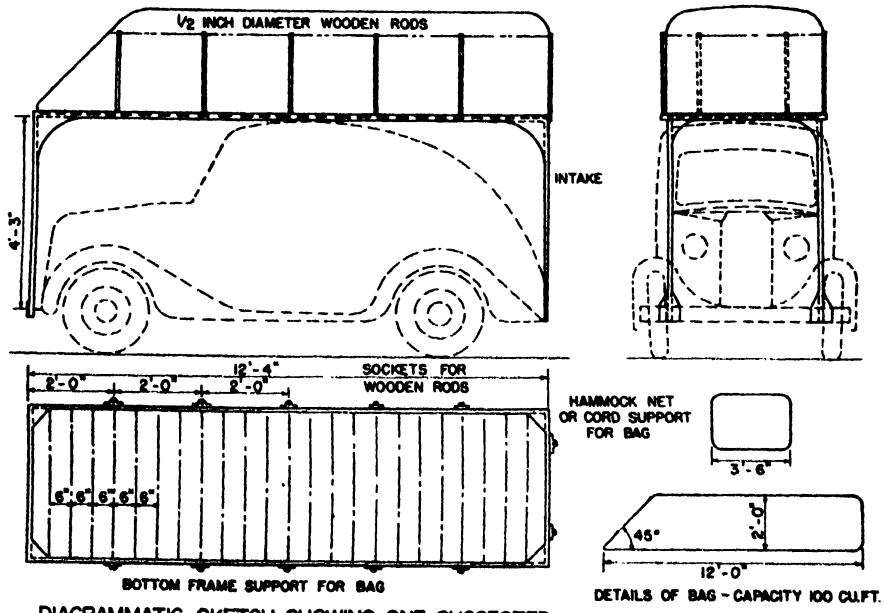
In spite of the abundant potential supply of coal in Germany, Holland, Belgium, northern France, Alsace, Lorraine, Poland, and Czechoslovakia, the aggregate production of which was of the order of 510,000,000 tons per year (1938 figures), factors limiting the maximum production capacity for war are doubtless man power and alloy steels. In addition to furnishing the coal required for hydrogenation purposes, a further limitation imposed on extension of the coal-oil synthesis plants lies in the vastly increased coal requirements of the other war production industries. According to previous data (*41*), the coal needed to manufacture 1 ton of gasoline amounts to 5 tons, and upon this assumption synthetic oil from coal will reach its approximate limits at around 42,000,000 barrels (reached in 1941), although according to Lisle (*52*) the goal set for oil from this source has been placed at about 62,000,000 barrels for 1942.

France has some small coal hydrogenation units producing motor fuel at the rate of about 2,800,000 barrels a year—a top estimate—whereas Italy hydrogenates heavy high-sulfur Albanian crude oil to motor fuel at the yearly rate of about 3,260,000 barrels. The data are shown in Table VII.

Table VII. Synthetic Fuel Plants in Axis-Dominated Countries

	Synthetic Fuels (*37*) *Barrels*
France	
Bethune	425,000
Lievin	425,000
Harnes (Pas de Calais) (Fischer-Tropsch)	85,000
Projected building (1939)[a] 4 plants	1,955,000
Italy	
Bari	1,520,000
Leghorn	1,520,000
Valdarno, Tuscany	165,500
Total Oil Output by Hydrogenation Outside Germany	6,095,500

[a] It is not known whether these plans were carried through because no information has been available on their status since June 1940.



Compressed Gases

With the severe rationing of gasoline from petroleum and synthetic oils from coal sources, the use of alternate fuels has become necessary in many nations. Compressed fuel gases were developed for some years before the Second World War. Low-pressure combustible gas for gasoline engine propulsion started during the last war.

The low-pressure installation developed during the First World War is definitely a makeshift appliance, since the container for the gas is approximately as large as the vehicle on which it is installed. These containers (*34*) shown in the diagram, vary from 100 to 720 cubic feet and provide for a range of from 15 to 25 miles per filling. The life of the fabric containers is about one year. Provisions are made for refueling the gas bags at regular gasoline filling stations where the gas connection is made from the city gas mains. Two hundred and fifty cubic feet of this gas are equivalent to one gallon of gasoline.

Some of the chief drawbacks to the system have been: first, the size of the balloon necessary to be effective in driving; second, the wind resistance of the fuel bag, which is considerable at regular automobile speeds; third, the tendency of the bag to leak after two or three weeks with dilution of the gas with air; fourth, collection of snow in the winter time and, because of this added weight, the pressure is great enough to force gas into the engine too quickly and cause backfiring with subsequent stalling; a fifth difficulty is the inadequate height of the bridges and underpasses to accommodate trucks with gas bags, although bridges 13 feet high or more give no difficulty even for trucks. In July 1940, despite all drawbacks, there were 80 gas filling stations in London, and a survey made by the British Commercial Gas Association has listed the gas filling stations in each county.

Compressed gases under pressures varying from 75 to 5,000 pounds, depending on the type of gas, are more efficient in utili-

DIAGRAMMATIC SKETCH SHOWING ONE SUGGESTED METHOD OF ATTACHING GAS BAG TO A SMALL CAR AS USED IN ENGLAND

FOR AUSTRALIAN CONDITIONS IT IS SUGGESTED THAT THE WIDTH OF THE FRAME SHOULD BE EQUAL TO THE OVERALL WIDTH OF THE MUDGUARDS - ABOUT 5'-0"

Table VIII. Compressed Gases in Relation to Gasoline

Gas	Cylinder, Weight, *Lb.*	Pressure *Lb. per sq. in.*	Gas *Lb.*	Gasoline Equivalent *U. S. Gal.*
Propane-Butane	117	75–150	100	18.0
Methane	115	3000–5000	28	4.56
City gas	155	3000	12.6	1.8

zation than the low-pressure gases just discussed. However, here, too, there are drawbacks which cut their efficiency for automobile use; the factor of greatest importance is the extra weight which must be carried as the steel cylinder. Table VIII shows the weights of the compressed gases and values in relation to gasoline (*20*).

In this field, as well as in the manufacture of synthetic fuel from coal, Germany has gone the farthest in its development. In 1939 Germany had six types of bottled gas on the market—city gas, coke oven gas, methane, propane, butane, and Ruhrgasol. The facilities for the utilization of these gases include more than 50 filling stations and about 75,000 vehicles using compressed gases of the various types (*11*). The propane and butane are derived from the hydrogenation and Fischer-Tropsch plants.

Methane and city gas are more widely available than propane and butane. Natural gas fields, sewage disposal plants, and coal hydrogenation, coal carbonization, and oil refineries provide a considerable source of methane. Italy (*11*) has a small gas field near Milan which has been developed for providing methane. Probably the most outstanding development of a fuel gas source has been the utilization of methane derived from fermentation of city sewage. In Sweden, as well as in other countries, there has been development in this line. The sewage gas (*14*) as it comes from the disposal plant is 64 per cent methane and 35 per cent carbon dioxide. This product is considered richer in caloric content than city gas. Purification of sewage gas takes place before it is used in motor cars, although there are 40 cars belonging to the road and street commission in Stockholm which use the unpurified gas. This unpurified gas is about 58 to 78 per cent as efficient as benzene.

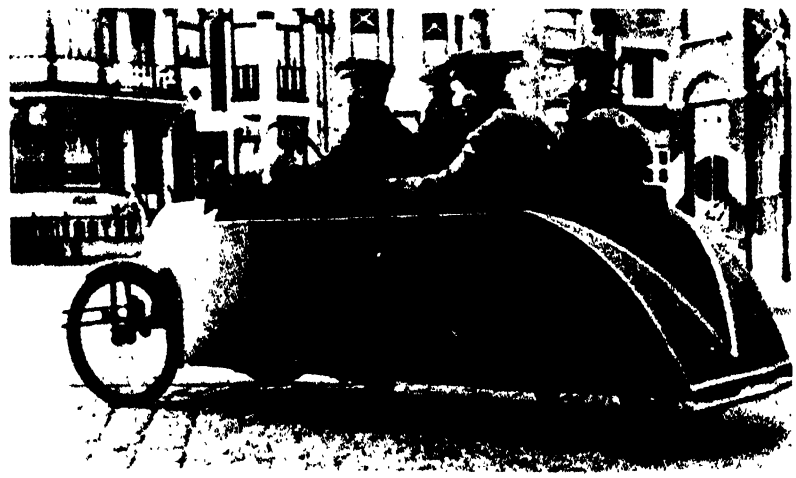
The cylinders for the use of sewage gas are about 1.4 cubic feet capacity, and 2 to 4 cylinders are necessary for each car. Each cylinder contains 212 cubic feet of gas compressed to about 2,000 pounds per square inch. The installations are the same as for city gas and methane. At the compressed gas filling station the filling time is the same as for gasoline.

In utilizing the gases, the changes in the car involve a spark advance and a change in the carburetor and a system of valves for stepping down the gas pressure before entering the carburetor. Many cars are arranged so that a change from benzene to the gas may take place at the instrument board. The cost of conversion to the gas-burning vehicles ranges between $150 and $175, and the steel cylinders from $20 to $22.50 per cylinder. Very few cities have the type of sewage systems necessary to obtain the methane for fuel.

England has had some development of sewage gases for fuel but no extensive application has been made. According to same reports (*36*) many of the larger cities throughout Europe have utilized the gases from sewage for power purposes for some time. Table IX shows the number of vehicles in various European countries that have been converted to the use of compressed gas.

Table IX. Compressed Gas Vehicles in 1941

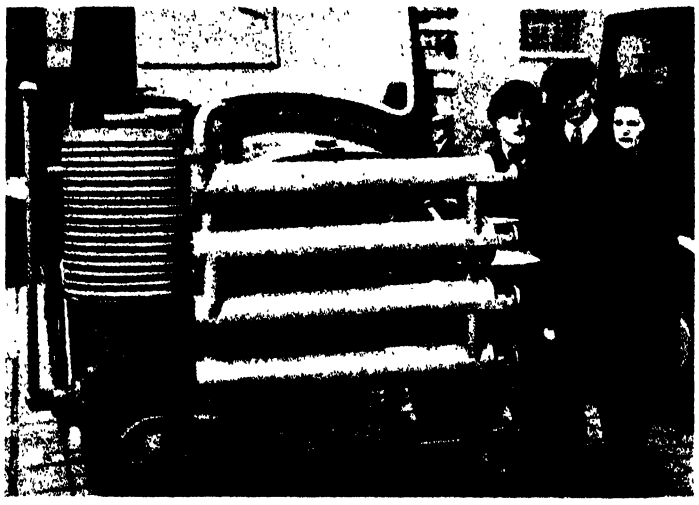
Country	Number of Vehicles
Germany (*11*)	75,000
Britain (*6*)	10,000
France (*42*)	500
Sweden (*30*)	1,367
Denmark (*40*)	358
Italy (*23*)	20,000
Total Vehicles	107,225



The Soviet Union, France, and Denmark have developed compressed gaseous fuels also, and in general the type of apparatus used has been much the same as in other countries. A study (*16*) made in Russia in 1940 has shown that while preference was given the development of gaseous fuels, little utilization has been made. Authorities in Russia (*16*) have claimed that yearly utilization of coal gases in the Don River Basin alone would be equivalent to approximately 8,500,000 barrels of gasoline. The Soviet Union also has rich deposits of natural gas in the Caucasus, Central Asia, the Far East, and other localities. Liquid gases are further available in large quantities as by-products from the petroleum industry.

According to latest news from Italy, methane gas, compressed to 300 atmospheres overpressure, has been used to run a gas-fed railway engine of 120 horsepower between Rovigo and Venice. It is planned to place more of these locomotives in service (*5*).

Gas Producer Development



Wood, coal, and other solid combustible materials have been used for some years as motor fuel in countries lacking in oil resources. A number of factors must be considered in the widespread adaptation of gasogene (gas producer) vehicles, although the present war has left no choice. The use of gasogene-propelled motor vehicles has increased greatly in the past few years. In 1938 the European Continent had about 9,000 trucks and busses in operation, whereas 1941 indicated about 450,000, a fiftyfold increase. The tonnage of producer fuel substituted for about 8,329,000 barrels of gasoline. There are, generally speaking, three types of fuels used in the gasogene vehicles—wood, charcoal, and coal or their mixtures. In many countries, wood and charcoal are the main types of fuel used; in others coal has become as widespread as wood.

Four countries, Germany, France, Sweden, and Italy, have been mostly responsible for the use and improvement of the gasogene vehicle. For a number of years only hard woods, well dried, were

ACME PHOTO

Even German soldiers in occupied France cannot get gasoline for their sightseeing tours. German ingenuity, says the German censor-passed caption on this picture, solves the problem with vehicles like this one—a treadmobile in which the legs of the soldiers provide the "horsepower". A soldier in the rear seat puts out his hand to signal for a left turn.

ACME PHOTO

Fastened to the front of the lorry is one of the devices expected to prove the most effective substitute for gas engines in London. Another type is mounted on a trailer behind the vehicle it propels. Either apparatus produces fuel from coke or volatile coal.

importance in all countries utilizing the gas generator is to invent an engine that will run on all types of solid fuel.

Sweden, another country in which development of the gas generator has made much progress, has used the generator vehicle for a number of years. At the outbreak of the war there was little difficulty in turning from gasoline to gas generator vehicles. As in most countries, the majority of Sweden's gas generator vehicles are trucks, but other vehicles have been adapted as well. In January 1941 there were 20 different types of solid fuel burning motor vehicles on the roads in Sweden. Birch wood appears to be the most desirable fuel for them. A series of tests was run on coal and wood in comparison with gasoline, and it was found that use of coal producer gas resulted in less lubricating oil contamination than with wood gas. Since lubricants are strictly rationed in Sweden, coal gas was considered more economical than wood gas for the generator vehicles. More trouble was encountered in winter driving with wood gas because of its higher water content (*39*) and subsequent freezing.

In France a somewhat different note is being sounded. Although France for a number of years encouraged the building and use of gas generators, many of her experts had predicted

suitable for this engine; however, Germany (*60*) developed technical improvements in the engine, so that wet and soft woods may also be used. Filters made of glass wool remove the dust from the soft woods, and special heat exchangers have been installed to compensate for the heat loss due to utilizing wet woods. These and other improvements have brought the efficiency of wood gas vehicles close to that of the Diesel engine. A light-weight bus has been adapted for the use of wood gas from these sources.

That fuel may be available for the 231,000 gas generator vehicles in Germany, the German Motor Roads Fuel Co. (*22*) has arranged for more service stations to supply "chipped wood". Twenty-two wood stations were to be opened between Berlin and Dresden in May 1941 in connection with the gasoline filling stations. Germany required 2,891,000 tons of wood to propel the producer gas vehicles during 1941, although the distribution arising from such extensive use of wood places considerable burden on an already overtaxed transportation system in Germany (*65*).

With the widespread use of the wood gas generator the difficulty of increasing the supply of wood has become apparent and more attention has been given to the utilization of coal and peat. A problem which is still of great

ACME PHOTO

Paris busses are being converted to run on illuminating gas. The gas is contained in an envelope enclosed in a wooden case on top of the bus, and one filling drives the vehicles about 15 miles. Here a bus refuels at a gas station. The gas flows through the tube to the bag on top of the bus and into the cylinders of the motor, exploding in the same fashion as does vaporized gasoline.

ACME PHOTO

Motor vehicles in the Nottingham district, England, that normally run on gasoline are now being converted to coal gas because of the restrictions on oil consumption. Here are a sedan and a bus under way, their engines powered by a supply of coal gas carried in the containers on their roofs.

that too wide a use would cause a wood shortage. In June 1941 an order was issued forbidding the use of charcoal (*62*); the reason stated was that wood supplies had fallen far below expectation. A report from Vichy, February 13, 1942 (*31*) stated that the wooden paving blocks in the Place de la Concorde in Paris were ripped out to be used for fuel in wood-burning trucks, and that trees in the Bois de Boulogne had been cut down owing to a timber shortage. The gas generators that were being built at that time were expected to be modified in order to burn other solid fuels.

Holland is another country canceling permits for the use of the wood gas burner motor cars (*59*). There are approximately 1,770 trucks in service using wood gas, but in the future the manufacturers will be compelled to design the machine for burning peat since it is available in Holland.

Italy in 1938 had 2,200 wood-burning motor busses and trucks, whereas in 1941 there were 5,000 in operation. Italy is a country possessing very small forest reserves and less coal, hence the producer gas type motor vehicle has not alleviated the fuel shortage.

Denmark operated 11,656 wood-burning vehicles, according to *Foreign Commerce Weekly;* Norway, Belgium, and Finland with 5,563, 6,023, and 10,000 gas generator vehicles, respectively (see Table X) were also solving their fuel situation by this means since they had sufficient forests to provide the gas generator type of fuel.

Throughout the occupied countries in Europe and those affected by the blockade, the effect of the oil shortage has been to force the use of substitutes and in many instances that substitute has been wood or coal producer gas vehicles. Switzerland and Sweden, two of the four neutrals left on the continent of Europe, have felt the pinch of fuel scarcity to practically the same degree as the occupied countries. Switzerland licenses only the gasogene vehicles considered vitally necessary.

Embattled Russia, in spite of her vast oil resources, has also turned to the gas generator vehicle for motive power (*60*). Tractors and trucks in the Soviet Union (*15*) have had considerable development since many of the agricultural centers are far from liquid fuel supplies, but in or near the forests and peat beds. The design of the vehicles has been in some instances for charcoal and anthracite, and in others, especially the heavy trucks, for peat and bituminous coal. Tractors with producer gas units have been tried on straw briquets, but with no practicable results.

In France and Denmark a number of boats have been adapted to the use of charcoal or wood. Germany is reported to be operating 1,000 boats with 1,400 to be in use early in 1942.

Table X shows the number of vehicles in use in the various countries that have had to adopt solid producer gas fuels rather than liquids.

Table X. Producer Gas (Gasogene) Vehicles

Country	Number of Vehicles
Germany	231,000 (*35*)
France	57,000 (*66*)
Denmark	11,656 (*12*)
Finland	10,000 (1940) (*17*)
Belgium	6,023 (*27*)
Norway	5,563 (*61*)
Italy	5,000 (*47*)
Holland	1,770 (*59*)
Sweden	75,000 (*19*)
Russia	40,000 (1940) (*10*)
Total	443,012

The fiftyfold increase in producer gas propelled motor vehicles during the past three years has been confined to land vehicles and boats. It is interesting to note to what extremities some countries are being driven in the use of substitute fuels, as an Associated Press dispatch out of Rome, December 16, 1940, said:

Italian Plane Makes Flight on Charcoal Gas

Rome, Dec. 16 (AP). A flight by a charcoal-burning airplane, said to have been the first ever made, was reported today by the newspaper *Il Messaggero.*

The newspaper said the flight was made by Constantino Mazza in a Breda plane powered by a "gasogene" motor yesterday over Taliedo Airfield, near Milan. A test flight from Milan to Rome is planned next.

A special apparatus said to have supplanted the plane's gasoline tanks was described as weighing 176 pounds, 99 pounds of charcoal, and a low temperature furnace to convert the charcoal into gas.

Power Alcohol

Power alcohol consisting of both methyl and ethyl alcohol was fostered by a number of countries short of petroleum in an endeavor to make themselves self-sufficient by utilization of their own natural resources, not alone for peacetime but for war. Methyl or wood alcohol is derived from distillation of wood or sulfite pulp from papermaking and hydrogenation of carbon monoxide. Raw materials used for ethyl alcohol production are mainly foodstuffs, such as sugar, beets, and potatoes. It became a question of balance as to whether power alcohol is more important than food in the war economy.

It has been generally conceded that the alcohol industries were kept going in peacetime for the primary purpose of furnishing sufficient ethyl alcohol for the munitions industries in case of war. The events of the past three years or so have borne out this idea. It was reported in 1939 that Germany reduced the ethyl alcohol content of motor fuel from 8.2 to 2.3 per cent and discouraged the use of methyl alcohol entirely (*58*), and it appears as if ethyl alcohol will also be eliminated due to food shortage. The occupied countries of Europe are using alcohol as a motor fuel, although a general curtailment has been evident since 1936 because of technical reasons and food shortages (*1, 41*).

In 1941 France was utilising grape alcohol (*7*) as one of the substitutes for gasoline. The alcohol was distilled from the pulp after the wine was pressed, and oil was obtained from the grape seed. Grapes have also been the source of much of Spain's (*61*) motor fuel. The government instituted the use of alcohol to utilize the great surplus of grapes.

The Swiss Government (*21*) has designed a plant for the purpose of distilling wood which will produce 16,000 tons yearly of methyl alcohol and 10,000 tons of "alkaeton", a motor fuel substitute. Sweden also utilizes (*63*) wood alcohol and some turpentine. These products are derivatives of wood pulp by special processes. It has been estimated that wood alcohol could be produced to the extent of 290,000 barrels per year in existing plants.

Table XI shows alcohol production in the principal European countries.

Table XI. Power Alcohol Production in 1939 (*44*)

Country	Barrels
France	1,600,000 (*51*)
Germany	4,000,000 (*51*)
Italy	340,000 (*47*)
Poland	100,000
Hungary	80,000
Lithuania	50,000
Total for Axis Europe	6,170,000
Sweden (*21*)	290,000 (1941)
Switzerland (*61*)	195,000 (1941)

Many sources of power alcohol have been exploited, but perhaps the most unique of all is the one reported in Sweden where a baker adapted his ovens so that the alcohol produced during baking was condensed and used as a motor fuel. His fleet of 30 trucks are fueled by means of this alcohol (*29*).

The Electrically Propelled Vehicle

As a substitute for gasoline, the electrical vehicle in Europe has had some

ACME PHOTO

This Stockholm boat, too, feels the fuel shortage spreading all over Europe. It has been equipped with a generator which produces gas from charcoal.

further development and application in various countries due to wartime stringencies in the use of motor fuels. Germany again in the interest of attaining self-sufficiency in motor propulsion increased the number of electric vehicles from 3,434 in 1932 (*56*) to about 27,000 in 1940 (*9*). As an added incentive to their development, the electric vehicle was tax-free.

A government-sponsored project promoting the use of electricity for farm vehicles is reported to be saving 70,000 to 85,000 barrels of liquid fuel per year in this type of equipment alone (*69*). An estimated 100,000 electric motors have been installed on German farms since the beginning of the war (*67*).

In April 1940 M. Gasquet (*46*) estimated that about 900 electric vehicles were in operation in France, and the number was said to be increasing, a fact borne out in a recent publication of *Petroleum Times* in which the number of electric vehicles in France was estimated (*33*) at 2,000. Extensive propaganda fostering the use of the electrically driven motor car emphasized its utility (*33*), but the principal drawback for a widespread utilization of this vehicle lies in the fact that France is extremely deficient in lead, nickel, and copper, as well as in cadmium-nickel and ferronickel alloys for the production of electric motor vehicles and their batteries.

In 1933 the number of battery-driven vehicles in Britain numbered about 1,400 and at the end of 1940 the estimate (*38*) was about 6,500.

In Switzerland 6,000 to 8,000 electric vehicles (*55*) are in use ranging from light cars to 5-ton trucks. Milk dealers, bakeries, commercial houses, factories, postal authorities, officials of administration, and garbage collectors are the main users. One of the principal problems in Switzerland has been the installation of a sufficient number of recharging stations to care for the increasing number of electrical vehicles.

The chief drawbacks to the use of the electric motor car lie in the comparatively short time that is possible to run the vehicle before recharging. In addition to high battery replacement costs, the efficiency and speed decrease as the mileage increases before recharging. Their primary use is in short distance travel.

Japan

The Asiatic part of the Axis, Japan, has through the years endeavored to increase her fuel supplies by discovery, research, and conquest. Japan's primary sources are petroleum, coal hydrogenation, coal carbonization, and oil shale. Fuel substitutes include alcohol, wood, and compressed gas, and other miscellaneous fuels such as sardine oil and garbage. Japan's status in oil and its substitutes prior to the outbreak of the war with the United States, Britain, and Holland and the conquest of the Netherlands East Indies, British Borneo, and Burma is indicated in Table XII.

ACME PHOTO

In Japan where fuel is hard to find and automobiles expensive, this bicycle with a sidecar seating two is handy. The gadget will make 13 miles an hour easily, according to its inventor.

Table XII. Oil Economy of Japan

Source of Oil	Barrels
Japan	
Crude petroleum (*18*), including Formosa and part of Sakhalin (1941)	3,800,000
Synthetic oils (*49*), coal and carbon monoxide hydrogenation (1940)	4,000,000
Manchurian shale oils (*49*), (1940)	3,000,000
Motor alcohol (*44*), (1939)	2,396,000
Total oil indigenous to Japan	13,196,000
Foreign oil imports to Japan	*1940*
United States (*53*)	24,889,000
Netherlands East Indies (*49*)	7,000,000
Anglo-Iranian Oil Co. (*49*)	1,000,000
Mexico (*49*)	1,600,000
Total imports	34,489,000

Various authors have given the synthetic fuel production expected under Japan's 5- and 7-year plans. B. O. Lisle (*52*) has estimated 22,180,000 barrels, H. S. Norman (*53*) reports 16,000,000 to 18,000,000 barrels for this production, and *Business Week* (*4*) quoted 7,000,000 to 9,000,000 barrels. Owing to the immediately preceding estimates being based on plans for substitute fuel production in Japan, the improbability of their having been carried out (it requires about 5 tons of coal for each ton of oil) and the inability to obtain the necessary special alloys and equipment from Germany to hydrogenate coal and oil up to 12,000 pounds pressure and temperature of 950° F., it was thought advisable in Table XII to use the lower figure of 4,000,000 barrels of synthetic oils, as reported in *World Petroleum* of January 1942.

The foreign crude oil and products therefrom given in Table XII are direct shipments to Japan. To give an estimate of the volume transshipped through neutral ports was not possible. Just how much oil Japan had in storage December 7, 1941, is not clear, although considered "large". The oil-refining capacity of Japan in 1941 was reported to be about 64,000 barrels a day in 28 refineries. In comparison, the U. S. A. has a daily refining capacity of over 4,000,000 barrels of crude oil.

The consumption rate of petroleum and products for civilian use in Japan during 1940 was about 26,000,000 barrels, and for military and Navy needs about 14,000,000 barrels, or a total of 40,000,000 barrels peacetime needs. At the present war rate of oil consumption, Japan is probably using more than twice the latter volume despite drastic civilian curtailment.

The Netherlands East Indies in 1941 produced about 62,000,000 barrels of crude oil, while British Borneo yielded 9,500,000 barrels. The oil fields and refineries (in a highly damaged state) are in the hands of the Japanese.

According to Kessler (*70*) oil installations in the Dutch East Indies valued at $500,000,000 were developed over a period of 50 years and thoroughly destroyed before Japanese occupation. Many of the oil wells were plugged with cement so that a reopening of the well could not be accomplished without redrilling completely. In the destruction of Tarakan, Balik Papan, and Palembang alone, 88 per cent of the total oil available in the East Indies was cut off by the Dutch. Only at Tarakan, where the crude needs no special refining, could redrilling give the Japanese oil they need. According to the most authoritative statements from Batavia, the time required to obtain the necessary drilling equipment, pipe lines,

pumps, tanks, special refinery fabricated materials, fine instruments, etc., and actual drilling to production again would require from 18 to 24 months (*24*).

Burma Oil Production

Burma in 1941 produced 7,762,000 barrels of crude oil with several operating refineries. A thorough "scorched earth" policy was carried out by the British, which is borne out by a Calcutta, May 7 dispatch (*8*), as follows:

It will take the Japanese 10 years to restore the blasted Burma oil fields to capacity production, American drillers said today on arrival here from Yenangyaung and Chauk, where they helped demolish more than 4,000 wells in 8 days.

"We left behind nothing the Japanese could use," said G. Whitley, of Batson, Tex., an employe of Burmah Oil Co., who helped with the Yenangyaung destruction. "We destroyed 3,021 wells with explosives which dropped the pipes to the bottom and by firing the free flowing wells."

He said they also fired thousands of barrels of oil stored in tanks, then tore down tank and derrick superstructures, and cut up the machinery with torches.

The demolition was carried out between April 10 and 18, but most of the work was packed into the last two days after British authorities ordered total scorched-earth destruction.

Mr. Whitley said it would take at least 10 years to get the fields going to capacity and G. W. Akers, Long Beach, Calif., another Burmah employe, said it would take the invaders months to realize any flow even if they got equipment promptly.

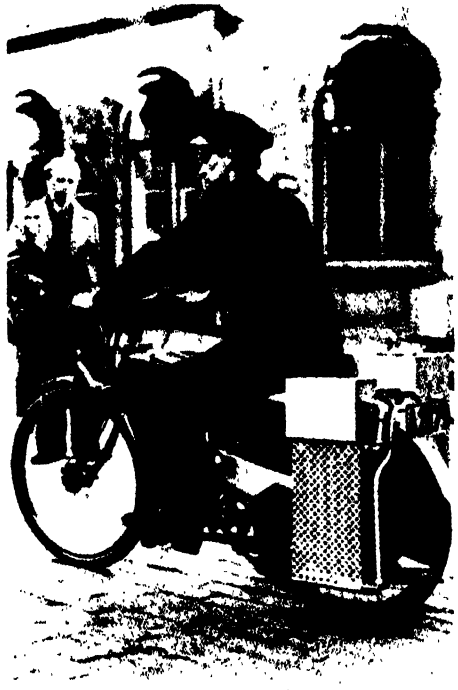
The 1941 production of the areas now in Japanese hands is shown in Table XIII.

Table XIII

Area	Production Barrels (*50*)
Dutch East Indies	62,130,000
British Borneo	6,864,000
Burma	7,762,000
	76,756,000

These oil-producing areas in the hands of the Japanese have been subjected to a scorched earth program, and oil there will be unavailable for some time to come. On this basis the substitute fuel production assumes a more important place in Japan's fuel economy than the outputs shown in Table XIII would warrant, since this production is indigenous to Japan.

The substitutes in use in Japan (*48*) at the present time are: gas generated from charcoal, wood, coalite, and acetylene from calcium carbide; and natural gas, petroleum gas, and methane from garbage, etc. Natural and compressed gas is used only in the area of its production because of a lack of steel containers for further distribution. The oil synthesis program (*53*) (Fischer-Tropsch and Bergius) has been slowed down considerably by the lack of steel and alloys both in Germany and Japan, and the absence of suitable coals for hydrogenation purposes in Japan. Charcoal and wood are the only substitutes that have received particular encouragement from the government, and even the charcoal substitutes are limited for motor fuel use since industrial and domestic demands far exceed production. The manufacture of the gas generators has also been curtailed owing to a steel and labor shortage.



Alcohol still remains a source of motor fuel, and according to laws reported enacted in Japan (*21*) all oil companies were required to maintain emergency reserves of alcohol equivalent to at least 20 per cent of the gasoline on hand for 6 months' sales.

The tanker fleet in Japan, which is of utmost importance in fuel transport to the war theater in the Far East, is reported to have consisted of 47 vessels (in 1940), the majority of which were the largest and fastest type (19 knots per hour in contrast to 10 to 12 knots) with a gross tonnage of over 440,000 tons, and was probably augmented during the past year (*66*). The Japanese law (*2*), required that all companies operating in the Japanese market carry a 6 months' supply of petroleum products. The government provided storage tanks for lease to the companies and covered any losses that might occur from evaporation or catastrophe (*3*). In addition to the commercial petroleum stocks on hand, the army and navy were known to have accumulated "large" inventories which were stored underground for protection (*53*).

Conclusion

Many types of motor fuels and substitutes are being used by the Axis powers. There is a decided stringency in the allowable use of even substitute fuels on account of lack of raw materials, manufacturing facilities, and man power for their preparation. The relatively poor quality of the Axis fuels has curtailed the maneuverability of their automotive transportation, including airplanes.

The successful conclusion of this war will be based largely on the superior quality and quantity of the motor fuels available to the United Nations in unlimited volume.

WIDE WORLD PHOTOS, INC.

One of the first charcoal-powered motorcycles in Stockholm. Many autos are driven by charcoal because of the restriction of gasoline to governmental use. The tank by the back wheel generates gas from charcoal.

Plastics Planning Board Advocated

PRODUCTION of smokeless powder in the United States on March 31, less than four months after we entered the war, surpassed the peak output of the first World War, Charles A. Higgins, president of Hercules Powder Co., Wilmington, Del., disclosed before the Society of the Plastics Industry at Hot Springs, Va.

Expansion in the manufacture of smokeless powder and other explosives has been responsible for a decrease in plastics production this year, Mr. Higgins said in his address entitled "Plastics and Powder". The mounting demand for plastics for the Army and Navy has been intensified by the crude rubber shortage, since some plastics are replacing rubber in hundreds of military and essential civilian uses.

Mr. Higgins suggested creation of a Plastics Planning Board to solve the difficulties created by the severe competition for raw materials and to increase plastics production in the United States. He predicted a shortage of plastics unless the plastics industry and the Government build new plastic chemical plants soon. Chemicals used by the plastics industry which now have been allocated to explosives production are nitric and sulfuric acids, ammonia, alcohol, formaldehyde, cellulose, and others.

Memphis Employment Clearing House

AT THE Employment Clearing House conducted as part of the national meeting of the SOCIETY in Memphis, April 20 to 23, 1942, 421 chemists and chemical engineers registered as candidates for employment. Only 17 were unemployed. Of this small group, 11 severed former connections in April, immediately prior to the meeting. Almost 55 per cent of the registrants, 230 in number, were employed but looking for opportunities to render increased service in the war effort or for personal advancement. The balance, 174, were students to be graduated in June—76 with the B.S. degree, 27 with the M.S., and 71 with the Ph.D.

Three hundred and eight employers' representatives, the largest number ever to use the facilities of the Clearing House, inspected the records. These included officers from the Chemical Warfare Service, Signal Corps, and Surgeon General's Office and representatives of the Ordnance Department, National Defense Research Committee, War Production Board, Civil Service Commission, United States Department of Agriculture, National Bureau of Standards, and the Tennessee Valley Authority. Many academic institutions also were represented. By far the largest number of users were from chemical industry, seeking trained men to operate the many new plants that are supplying important materials to the combat army. About one third of the employers' representatives could find the record of no one qualified for the vacancies to be filled; the other 191 requested 1,701 appointments for interviews during three and one half days.

It is not yet known how many of those interviewed were offered positions or how many accepted the offers made. As indicative of the keen competition, 16 applicants visited the Clearing House early in the week and asked to have their records withdrawn because so many positions had been offered each of them that further contacts were not desired; such requests have never been made at previous Clearing Houses. Reports of positions accepted by the registrants are being received daily.

Science Clubs Offer Prize Scholarships

FORTY all-expense trips to Washington, D. C., for a final examination and prizes of $12,000 in scholarships are offered high school students by Science Clubs of America. Preliminary examinations began May 15. This first annual science talent search, made by Westinghouse Electric & Manufacturing Co., offers to winners 18 scholarships of $200 each and two grand scholarships of $2,400 each.

New York Section Elects Officers

GLOBE PRESS PHOTO SERVICE

Charles N. Frey

CHARLES N. FREY, director of research of the Fleischmann Laboratory of Standard Brands, Inc., New York, was elected chairman of the New York Section of the AMERICAN CHEMICAL SOCIETY at the annual meeting of the section on May 8. Dr. Frey succeeds Ralph H. Müller.

Vincent du Vigneaud, head of the department of biochemistry of the Cornell University Medical School, New York, was named chairman-elect to take office in 1943. William W. Winship, manager of the New York Office of Thermal Syndicate, Ltd., of England was re-elected treasurer. Cornelia T. Snell, consulting chemist, continues as secretary.

New directors chosen include Charles O. Brown, Roland P. Soule, and Dr. du Vigneaud. Drs. Frey, Snell, Müller and Mr. Winship also will serve on the board.

The following were elected Councilors: M. Irene Bailey, R. A. Baker, B. L. Clarke, W. P. Cohoe, C. R. Dawson, E. J. Durham, R. L. Evans, A. S. Elsenbast, Louis Freedman, Carl Iddings, W. R. Johnston, D. H. Killeffer, L. G. Longsworth, H. B. McClure, S. P. Miller, J. M. Nelson, W. F. O'Connor, F. W. Power, Donald Price, W. M. Ralph, C. J. Rolle, P. W. Schutz, F. D. Snell, C. C. Steffens, F. W. Sullivan, C. S. Teitsworth, J. F. Walsh, W. J. Youden, and V. du Vigneaud.

The 1943 William H. Nichols Medal Jury of Award will be composed of Mr. Winship, chairman; Robert Calvert, L. P. Hammett, Drs. Frey and Müller, and Dr. Snell, secretary.

Memphis Meeting Abstracts

A FEW sets of planographed books of abstracts of papers presented at the recent Memphis meeting are still available from the A. C. S. News Service, 1155 Sixteenth St., N. W., Washington, D. C. The price is 50 cents per copy if order is accompanied by remittance and divisional receipt card, $1.00 per copy if order is accompanied by remittance but without receipt card; and $1.50 if bill must be rendered.

Chemical Engineers Meet in Boston

Top to bottom. D. P. Morgan of WPB; J. H. Rushton, University of Virginia; J. C. Elgin, Princeton; and M. C. Molstad, University of Pennsylvania

BOSTON, convention city for the third time to the American Institute of Chemical Engineers, was host to more than 500 institute members at the 34th semiannual meeting held May 11 to 13. Key events were the presentation of the Walker Award to E. C. Williams and an all-day Symposium on Heat Transfer held jointly with the American Society of Mechanical Engineers.

Dr. Williams, director of research of General Mills, is the recipient of the seventh William H. Walker Award. It was granted to him for his work on the production of synthetic glycerol and reported by him in the 1939 *Transactions* of the institute. Dr. Williams at the banquet Wednesday evening accepted the medal on behalf of his co-workers at the Shell Development Corp. where the work was done when he was director of research of that company. James G. Vail, former vice president of the institute and vice president and chemical director of the Philadelphia Quartz Co., made the presentation. Other speakers at the banquet, at which Gustavus J. Esselen, Boston consultant, was toastmaster, were Kenneth E. Bell, chairman of the Boston section and technical director of the A. C. Lawrence Leather Co.; Sidney D. Kirkpatrick, president of the American Institute of Chemical Engineers and editor of *Chemical & Metallurgical Engineering;* Stephen E. Simpson, professor of chemistry at the Massachusetts Institute of Technology; and James W. Parker, vice president of the Detroit Edison Co. and president of the American Society of Mechanical Engineers.

The joint Symposium on Heat Transfer was held on Wednesday with W. H. McAdams, professor of chemical engineering of Massachusetts Institute of Technology, presiding. Nine papers were presented during the day and abstracts appear below.

At the business meeting on Monday the A. McLaren White award to the winner of the institute's National Student Chemical Engineering Contest was presented to Charles C. Neas, a senior at the University of Illinois. Second and third prizes, respectively, went to Gilbert R. Shockley, Missouri School of Mines and Metallurgy, and Karl H. Rothe, Cooper Union Institute of Technology. Honorable mentions went to Harold R. Frisbie, Oregon State College, Robert E. Deatz, Kansas State College, and Herbert Kress, Pratt Institute. The contest problem this year was prepared by a committee from the technical staff of Monsanto Chemical Co. and was under guidance of the committee chairman, B. E. Thomas.

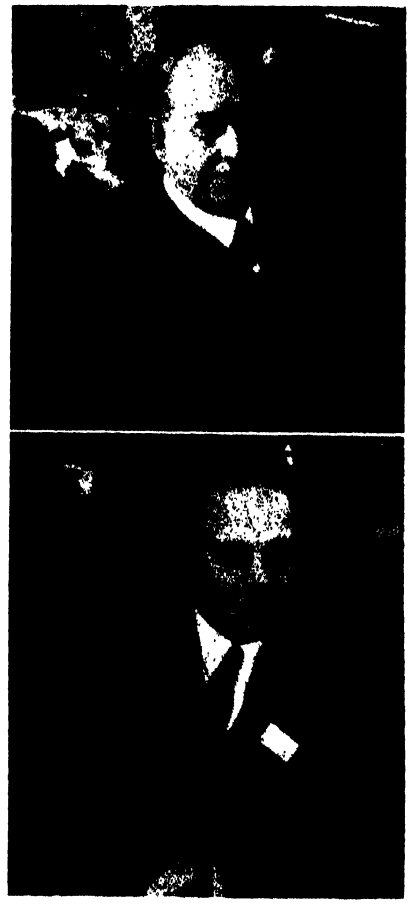
The Monday afternoon meeting was devoted to a closed discussion on War Problems of the Chemical Industry and

Top to bottom. S. L. Tyler, secretary of the A. I. Ch. E.; H. S. Lukens, of the University of Pennsylvania; J. R. Minevitch, E. B. Badger & Sons; and E. W. Comings, University of Illinois

Left to right. J. R. Huffman, New York University; J. L. Bennett, Hercules Powder Co.; James G. Vail, Philadelphia Quartz Co.

Walter G. Whitman of the WPB presided. The discussion was, at the request of the institute, considered confidential and no report can be made of the information presented.

The technical sessions were opened with an address by W. M. Rand, vice president of the Merrimac Division of the Monsanto Chemical Co., whose general subject was "New England Serves Again". Mr. Rand traced the rise of chemical industry in the New England area up to the present time, stating that:



Although some of the roots of the chemical industry were firmly set in the sparse soil of New England, the main stem, the foliage, and the fruits have developed elsewhere. But this does not mean abandonment of New England by the chemical industry. There are some materials which may be found useful—some kaolins, some excellent sands, forests of spruce and hard wood.

The contributions of New England to the war effort are not insignificant. It is truly an important part of the arsenal of democracy. In its borders are two large shipyards and many smaller ones turning out battleships, destroyers, cargo ships, mine layers, and smaller craft so badly needed today; two arsenals, two large Army training camps, and an important air base. In addition, its countryside is dotted with hundreds of war plants, ranging from a huge aircraft plant to hundreds of small machine shops. The Nation looks to New England to supply destroyers rather than smokeless powder, airplane engines rather than toluene, the Garand rifle rather than magnesium, uniform cloth rather than aluminum, machine tools rather than tanks.

The technical papers were presented as previously reported in the program and brief abstracts are here included with the exception of three papers, all of which appeared in the April 25 *Transactions* of the institute. They are "Chemical Engineering Aspects of Centrifugal Fan Design", by Carl V. Herrmann, of E. I. du Pont de Nemours & Co., Inc.; "Compressed Air for Ammonia Oxidation", by Donald G. Morrow, Hercules Powder Co.; and "Performance of Drip-Point Grid Tower Packings", by M. C. Molstad, A. R. Thompson, J. F. McKinney of the University of Pennsylvania and R. G. Abbey, of the General Refractories Co.

Abstracts of Scientific Papers

A. H. Maude, chemical engineer of the Hooker Electrochemical Co., Niagara Falls, N. Y., opened the technical sessions with a paper on "Anhydrous Hydrogen Chloride Gas". The history of the commercial production of hydrogen chloride was traced, and the technical problems in plant construction and equipment design were given. The method described most fully by Maude is the synthetic production of hydrogen chloride by burning of chlorine and hydrogen. Materials of construction depend upon the physical conditions. Early plants utilized silica and brick construction but today metals are used, provided certain precautions are taken such as correct metal temperature to prevent hydrogen chloride corrosion and dew formation. Thus iron may be used safely at 30° C. and copper at 5° C. above the dew point. If the gas is cooled to a temperature below the dew point, however, nonmetallic surfaces, such as glass, stoneware, impregnated graphite, and silica are necessary, though tantalum may also be used. Ignition of the gases is yet a problem, the best solution today being a retractable air-hydrogen blow torch. Alternate methods of HCl production were also given. The principal commercial method of concentrating hydrogen chloride is absorption in water to form a concentrated solution and subsequent distillation and condensation of water from the vapors and drying of the hydrogen chloride gas by sulfuric acid. An alternative method consists in absorbing the hydrogen chloride with a metallic salt in a manner analogous to the addition of water of crystallization by some anhydrous salts. The compound when saturated with hydrogen chloride gas is heated to remove the pure hydrogen chloride from the nonvolatile salt and the latter re-used to repeat the cycle. Among the salts considered are lead and copper sulfates which are thought to form $PbSO_4.2HCl$ and $CuSO_4.2HCl$, respectively. At 83° C., 1.5 moles of hydrogen chloride are removed from the copper salt, but 0.75 mole of hydrogen chloride is still retained at 100° C. In the case of the lead compound 1.5 moles of hydrogen chloride are removed at 32° C. but the balance is not removed even at 100° C.

Above. G. J. Esselen, consultant of Boston. *Below.* G. G. Brown, University of Michigan

Moisture must be absent in such an absorption process, and this system is said to work satisfactorily with gases containing 50 per cent hydrogen chloride or more. All the gas cannot be absorbed, however, and from 1 to 5 per cent may pass through to water scrubbers. Through the use of carriers for the absorbing salt, equipment now exists which can extract from the gas stream 14 pounds of hydrogen chloride per cubic foot.

J. G. McGiffin, Standard Oil Co. of Ohio, gave considerable data pertaining to the performance of a commercial crude naphtha stabilizer. His investigation covered six different engineering performance tests run on a stabilizer, 42 inches in diameter, 61 feet high, and a total of 30 trays spaced at 18 inches except that the 3 bottom trays were 3 feet apart. Each tray had 18 bell caps, $4^{7}/_{16}$ inches outside diameter, and the feed to the tower entered on tray 16.

Four runs were made attempting to cut between isopentane and normal pentane and two tests were made to cut normal butane and isopentane. Operation was such as to produce nearly flooding conditions in the tower. For the particular tower and problem involved, McGiffin concluded that fractionation suffers from flooding, and downcomer liquid velocities in the lower portion of the tower become excessive when the rates are 1.5 feet per second when reboiler weight vaporization to bottoms ratio is above 3/1, or 1 foot per second when reboiler-bottoms ratio is above 1.5/1. He also found that fractionation is satisfactory when downcomer liquid velocities, in lower portion of tower, are maintained below 0.9 foot per second when reboiler-bottoms ratio is at a minimum of 1.4/1. Fractionating suffers somewhat when actual vapor velocities exceed the critical velocity as calculated by formula $V_c = 4.04\sqrt{\frac{TS}{MP}}$ where T = vapor temperature $R°$; S = liquid specific gravity at temperature T; M = vapor molecular weight; P = operating pressure in pounds per square inch absolute.

A summary of experimental and development work conducted during the last five years to bring a grain distillery up to date from the engineering standpoint was given by A. Herman, E. M. Stallings, and H. F. Willkie, of Joseph E. Seagram & Sons, Inc., Louisville, Ky.

In grinding experiments, a subject of great controversy in the distilling industry, it was claimed that no difference was found between corn ground in roller mills or in hammer mills. This refutes the former belief that roller mills produce flat particles and hammer mills irregular shaped particles. Experiments indicated that roller mills required one third to one half less horsepower per bushel than hammer mills to produce similar fineness, but maintenance on the roller mill was double the cost for the hammer mill. The cooking process, formerly requiring 2 to 3 hours, is now accomplished on a continuous basis taking only 30 seconds. The slurry of

W. M. Rand of Monsanto's Merrimac Division

water and grain, about 25 per cent by weight of grain, is preheated to 165° C. and then passed through a steam mixing jet into a holding vessel. During its passage it is cooked as thoroughly as in the old operation. Flow charts of the new low-temperature system for distillation of fermented mash were given. The particular advantage of this new system is the production of spirits that are more neutral. The lower the temperature in distillation, the more neutral, relatively, are the spirits obtained.

Stillage is recovered by screening to remove solids, and the liquid from the screening is evaporated in a five body, quadruple effect evaporator. Through experimentation, forced circulation, long tube evaporators were found to have the best qualities for the problem of evaporating the highly viscous stillage. Three effects, however, have natural circulation, while the last two effects are forced circulation as they evaporate the most viscous material. Vitamin assays showed that the sirup concentrated in the evaporators was high in riboflavin and other members of the B complex. Cattle feed of recovered solids and sirup is made by mixing these two products and drying in drum dryers.

"Pumps in the Chemical Industry" was the subject discussed by W. W. Mellen and A. P. Smith, of the E. I. du Pont de Nemours & Co., Inc., plant at Penns Grove, N. J. Classified into three groups by the authors, centrifugal, positive displacement, and lift types, pump selection is based on five factors—corrosive action, erosive action, head and specific gravity, temperature, and viscosity.

In selecting pumps for corrosive services the authors made the following observations: for pumping hydrochloric acid, centrifugal pumps of durochlor are used extensively up to 30 per cent acid and from 30° to 40° C.

High chrome nickel iron alloys are used for sulfuric acid of 72 to 98 per cent concentration, whereas acid of 100 per cent and over can be handled by cast steel. For lower concentrations hard lead or high silicon iron may be used.

No satisfactory practice exists for hydrofluoric acid. For acid above 60 per cent a small inexpensive cast iron gear type pump with direct motor drive, having a capacity of 20 gallons per minute, is used. Pumps are replaced frequently and no repairs attempted since cost of the unit is low. Carbon may prove to be a good material for this acid in the lower concentrations.

Mixtures of nitric acid and sulfuric acid of varying compositions are pumped with horizontal externally mounted pumps, the materials of construction being high chrome nickel alloy.

Dowtherm and diphenyl at temperatures up to 200° C. are pumped with a centrifugal internal bearing type pump, of Ni-resist casings, carbon steel rotors, bronze bushings, and Nitraloy shaft sleeves.

For pumping lead at 450° C. a special pump was designed having enlarged steel shafts of precision finished steel and high tensile strength. The pump column was fabricated from steel pipe having welded steel stiffening ribs, bearing surfaces were Stellited, and discharge lines were 18-8 steel.

It was found that a system of regular inspection and maintenance repair by a crew of trained pump specialists played an important part in minimizing breakdown. For an increase in production of 100 per cent, the increase in pump maintenance costs in locations where pump inspections were not provided was four times as great as in comparable locations where pump inspections were systematic.

The fundamental factors influencing the performance of rotary dryers was the contribution of C. O. Miller, Case School of Applied Science, B. A. Smith, Bartlett and Snow Co., and W. H. Schuette, Dow Chemical Co. Direct heat rotary dryers were investigated for heat transfer relationships representative of a system removing surface moisture from nonhygroscopic materials. Data were collected on the effects of temperature difference, air velocity, number of flights, flight size, and retention time.

The rate of heat transfer (for similar operating conditions) was found to be directly proportional to the temperature difference. Increased air velocity results in

a more efficient removal of moisture, since too low a velocity leads to the air becoming saturated before traveling the length of the dryer. The effect of the number of flights was expressed as a slope of 0.69. This appeared as a power for the number of flights in the final equation indicating an increase of heat transfer rate for increased flights. The heat transfer was independent of the retention time. After comparing the experimental results with several large-scale installations the authors obtained the following expression for predicting capacity for rate of heat transfer in a rotary dryer.

$$Q/\theta = 0.85\, LDn_f^{0.69}G^{0.55}\Delta t_m$$

where Q/θ = rate of heat transfer
L = length of dryer cylinder
D = cylinder diameter
n_f = number of flights
G = air velocity
Δt_m = log mean temperature difference

Henry T. Ward, Drexel Institute of Technology, discussed the use of dimethylformamide as a solvent for the extraction of Pennsylvania type lubricating oils. Extractions with this material were carried out on steam-refined lubricating stock, both waxy and dewaxed, and a 180 neutral stock in single-batch and countercurrent procedures. Solvent ratios of 1/1 to 3/1 were used.

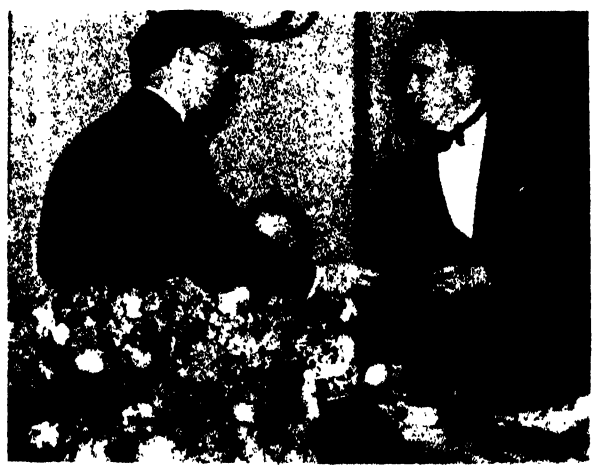
Compared with other solvents, dimethylformamide was thought to be a reasonably good solvent. Chlorex, furfural, and nitrobenzene produced better improvements in viscosity index, carbon residue, and per cent yield, but the difference was slight. Though gravity difference between the new solvent and the heavy oils is small, it is considered possible to make effective and rapid separations of extract and raffinate layers to meet large-scale operations. Flash, fire points, and filter yields were satisfactory. Loss in recovery from raffinates and extracts was less than 0.2 per cent. A solvent ratio of 2/1 seemed to be the best range of operation.

D. F. Boucher, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., and J. C. Brier, University of Michigan, reported on the solvent extraction of oil from a porous mass. The authors, in simulating the extraction of oil from soybeans, prepared porous clay plates or slabs, which after being air-dried at 900° C. to give a porosity of 41 per cent, were saturated with a phosphatide-free soybean oil. Solvents used in the runs were tetrachloroethylene and an azeotropic mixture of 79 per cent carbon tetrachloride and 21 per cent ethylene dichloride.

To differentiate between the two resistances to diffusion of oil from the plate to the solvent—namely, resistance due to the capillary structure of the plate and the liquid-film or resistance to diffusion into the main body of the solvent—extractions were run in which the solvent velocities were varied, causing changes in Reynolds numbers from 14.7 to 20,400, and when residual oil content of the plates was plotted against Reynolds numbers it was found that the two were independent, indicating that liquid-film resistance was inconsequential as compared to the resistance within the plate.

The extraction period may be divided into two stages. The initial extraction stage, which accounts for only a small fraction of the total time, is characterized by a substantially constant center-line concentration within the plate. The extraction rate during this period corresponded to the equation

$$\frac{dW}{Ad\theta} = \frac{25.15 \times 10^{-4}}{(\mu_0\mu_S)^{0.515}} \frac{(X_1 - X_E)}{(X_1 - X)} (C_S - C_L)$$



where W = solute weight, lb.
A = exposed surface area, sq. ft.
θ = time, hours
μ_0, μ_S = viscosity solute and solvent
X_1 = initial solute content solid, lb. solute/lb. solid
X_E = equilibrium solute content of solid or concentration in solvent, lb. solute/lb. solid
X = solute content of solid, lb. solute/lb. solid
C_S = concentration of liquid within plate, lb. solute/cu. ft. solution
C_L = solvent concentration, lb. solute/cu. ft. solution

The final extraction stage is characterized by a falling concentration at the center-line plate and corresponds to the equation

$$\frac{dW}{Ad\theta} = \frac{36.15 \times 10^{-4}}{(\mu_0\mu_S)^{0.348}} (C_S - C_L)$$

The effect of plate thickness and porosity was not evaluated since in these trials only one plate thickness and porosity were used.

The adsorption of chloroform from air by beds of activated carbon was the basis of a study by H. C. Engel and J. Coull of the University of Pittsburgh, and J. Miller, Mellon Institute. A relation for adsorption efficiency was reported which was related to time, and the authors investigated the method of Bohart and Adams and Furnas in an attempt to predict the influence of the variables.

J. G. Vail presents Walker Award to E. C. Williams.

J. F. White, Merrimac Division, Monsanto Chemical Co., spoke on the "Manufacture of Silica Aerogel", the heat transfer method when autoclaving the gel, and over-all heat balances and transfer coefficients.

The manufacturing operations were, first, the addition of sodium silicate to a solution of sulfuric acid, concentrations being controlled to give a gel having 8 per cent silicon oxide. The gel is aged to give firming due to syneresis, and then passed through roll crushers into one of four wash tanks. Water is circulated through to remove any sodium sulfate formed in the gel reaction and when washed sufficiently, the water is drained and alcohol added. After suitable soaking, a fresh alcohol portion is substituted and the gel is washed as one of a unit in a four-stage countercurrent system. Weak alcohol taken from the system is fractionated in a recovery column. The gel is transferred to an autoclave and heated to 550° F. at 1,150 pounds gage. Pressure is then reduced to atmospheric pressure, and the gel is finally evacuated at 20 inches of mercury for 10 minutes. The resultant aerogel is removed by an airveyor system. The substitution of alcohol for the water before autoclaving gives a system capable of being removed at the critical point, thereby preventing the collapse of the gel due to surface tension and at the same time obviating the increase in size of the colloidal particles which is characteristic of silicon oxide in the presence of water.

It was found that the general over-all heat transfer coefficient for the particular autoclave charged with 450 pounds aerogel was 26 B. t. u./(hr.)(sq. ft.)(° F.). Radiation was found to play a relatively unimportant part in the transfer of heat as particles of silicon dispersed through the gel did not appreciably change the over-all heat transfer coefficient.

Cooling organic liquids before discharging into storage tanks often prevents excessive loss in the displaced air, and in an attempt to encourage the practice of using vapor condensers to do this cooling, A. P. Colburn, L. L. Millar, and J. W. Westwater, University of Delaware, conducted basic research on the use of vertical vapor-in-tube condensers, with the tubes long enough

to accomplish the desired degree of subcooling.

The work was done on a single condensing tube, as this was the best means of obtaining the fundamental data for design purposes. A $^7/_8$-inch outside diameter condensing tube, surrounded by a 1-inch inside diameter tube for the water coolant, was used. Spiral flow was assured by winding a 10-gage wire around the inside tube and forcing the outside tube over the filed down wire.

Results indicated that vapor temperatures of the organic materials condensed—acetone, isobutanol, and trichloroethylene—were steady down to a certain point where they varied widely for about 6 inches of tube length, and then dropped steadily to the exit port. Interpretation is that the gases condensed in a very sharp zone.

The authors were able to suggest a design procedure on the basis of the data obtained. They recommended: estimation of the average condensate temperature at the end of the condensing section to break down the heat load to condensing and subcooling requirements; prediction of the separate film coefficients; selection of the proper mean temperature differences; and calculation of the tube length for each duty.

Heat transfer coefficients for liquid flow which is neither fully laminar nor fully turbulent, titled semiturbulent flow and occurring between Reynolds numbers of 1,500 to 11,000, were given by R. N. Norris and M. W. Sims of the General Electric Co. Used for these tests was an Admiralty-metal tube, 0.527 inch in diameter and 11 feet long. The fluids tested were a light mineral insulating oil and askarel, a chlorinated hydrocarbon. Coolant was water. Results of the authors' tests indicate that one equation will predict the heat transfer to within ±5 per cent for flow in the semiturbulent region.

$$\left(\frac{h}{cG}\right) = 0.0067 \left(\frac{c\mu}{k}\right)_a^{-0.8} \left(\frac{\mu_a}{\mu_w}\right)^{0.14}$$

where h = surface heat transfer coefficient, B. t. u./(hr.) (sq. ft.) (° F.)
c = specific heat of liquid, B. t. u./(lb.) (° F.)
G = weight velocity of liquid, lb./hr./sq. ft.
μ = absolute viscosity, lb./hr./ft.
k = thermal conductivity of liquid, B. t. u./(hr.) (sq. ft.) per (° F./ft.)

Subscript a indicates the values are based on the average inlet and outlet temperature of the liquid being cooled and w on the temperature at inner tube wall surface.

Using this correlation, test results show much less scatter than older forms of equations. Simplicity of use is also a factor for curved lines, for which no equation existed before and which are now shown to be part of a straight line.

New conclusions, obscured by the complexity of previously available correlations, are found justified, provided the effect of variation of fluid properties is excluded. They are:

1. Surface heat transfer coefficient is directly proportional to velocity.
2. Temperature drop of the fluid while passing through the tube is independent of velocity for a fixed inlet temperature and a fixed uniform tube temperature.
3. Heat transfer coefficient is independent of tube diameter, at least for the large length to diameter ratio tested.

President Kirkpatrick recites Kipling's "Sons of Martha" at the banquet Tuesday.

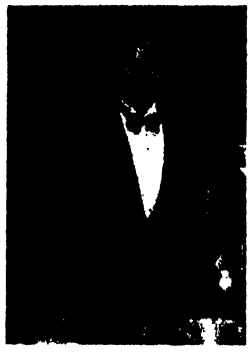
A voluminous study on heat transfer and pressure drop for a fluid flowing in the viscous region through a vertical pipe was given: the work of L. M. K. Boelter, University of California, and six associates.

New data were presented for oil and water moving in streamline flow up a steam-heated vertical pipe and reported in several mathematical equations of a complexity which prevents reporting in this abstract. In general, however, the results are fairly close to predictions by theoretical methods based on vertical pipes. The measured pressure drop was found to be in fair agreement with previously published material also.

J. H. Wiegand, E. I. du Pont de Nemours & Co., Inc., and E. M. Baker, University of Michigan, collaborated in a report on transfer processes in annuli, basing their study on the premise that the rate of transfer of energy as friction and heat and the rate of transfer of material are closely related to the measurements of turbulence in flowing streams and, for flow in around pipes, these rates have been correlated by the Reynolds numbers. It is of interest to study corresponding relationships for annuli. Several relationships were derived and compared to published data, basis being the J factor of Chilton and Colburn[1].

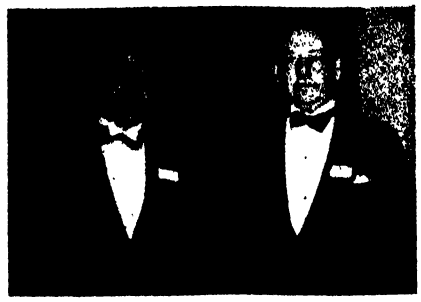
For laminar flow where the ratio of inner to outer diameter of annulus is between 0.85 and 1.0, the annulus is satisfactorily regarded as two parallel plates. With turbulent flow, if transfer occurs at one wall only, J varies with the ratios of inner and outer wall diameter.

The Jordan equivalent diameter, equal to four times the ratio of the cross-sectional area divided by the heated perimeter, did not seem to be a proper measure of the general turbulence in the stream. As turbulence is a controlling factor with transfer it was felt that an equivalent diameter, $d_2 - d_1$ or the ratio of the cross-sectional area of flow to the wetted perimeter, would be a better measure of turbulence.



C. C. Monrad, Carnegie Institute of Technology, and J. F. Pelton, Linde Air Products Co., were joint authors of an article on the heat transfer by convection in annular spaces. Heat transfer coefficients were obtained experimentally for fluids and air flowing turbulently in annuli. Heat transfer was from the inner tube of the annulus and a variation of ratio of outer to inner diameters of 1.65, 2.45, and 17 was used. Temperatures varied from 80° F. to 180° F., Reynolds numbers from 12,000 to 220,000. Heat transfer from the outer tube to the inner was studied for tube ratios of 1.85.

Results indicate that the Dittus-Boelter or the Colburn equations were satisfactory, provided an equivalent diameter, equal to four times the hydraulic radius, was used.



Utilization of hydrolyzed lignocellulose as a semiplastic filler for standard resins was found, by Raphael Katzen and Donald F. Othmer of the Polytechnic Institute of Brooklyn, and A. O. Reynolds, Northwood Chemical Co., to give several advantages over conventional fillers, among them an accelerated molding cycle and a conservation of resin used. Hydrolyzed lignocellulose is made by a continuous process at the Northwood Chemical Co., and it has been found that with standard phenol-formaldehyde resin products, proportions of 3 parts of lignocellulose filler and 1 part of resin yield acceptable results.

J. W. Merrill and J. E. C. Valentin of the Bakelite Corp. reported on the problem of dust control in the plastic industry. Dust explosions have resulted in the destruction of $51,000,000 of plant investment, 1,080 persons injured, and 487 killed. The proper design and selection

E. C. Williams, General Mills, accepts the award.

K. E. Bell, chairman, Boston Section, and G. J. Esselen, general chairman of meeting

J. W. Parker of Detroit Edison, president and representative of A. S. M. E.

of equipment and the analysis of the particular dust and problem involved are some of the necessary steps in the prevention of these losses, the authors concluded.

The use of liquid solvents, normally gaseous, in the region of their critical temperatures as solvents for long-chain fatty acids and related substances was the subject of a paper by A. W. Hixson, Columbia University, and J. B. Bockelmann, Colgate-Palmolive-Peet Co. The data obtained, the authors state, are indicative that this new system may be the basis of a new liquid-liquid extraction process.

H. C. Hottel, Massachusetts Institute of Technology, and R. B. Egbert, Carbide and Carbon Chemicals Corp., reported on experiments and an analysis they made of the data of other investigators in the field of radiant heat transmission in the hope of resolving, into one acceptable method, the various techniques now used in calculating the radiant heat transmission due to water vapor. The results were given in two charts presenting the emissivity as a function of gas temperature and the product term in an ideal state of zero partial pressure of water vapor. A second chart enabled corrections to be made in terms of a finite pressure.

A. C. Mueller, E. I. du Pont de Nemours & Co., Inc., reported on the heat transfer from wires to air in parallel flow.

Melvin Avrami and Victor Paschkis reported on the results of a study with their experimental electric analogy, originally devised by C. L. Beukin of Holland[1], in studying the diffusion of heat through a long rectangular bar.

[1] News Ed., 19, 740 (July 10, 1941).

Charles E. Reed, formerly assistant professor of chemical engineering at the Massachusetts Institute of Technology, has joined the staff of the General Electric Co.'s Research Laboratory, Schenectady, N. Y., as consulting chemical engineer.

Profits of the Chemical Industry

In an analysis of the profits of the chemical industry during 1941, the *New York Times* of April 27, 1942, gives statistics for various periods by different classifications in the industry, based on a study of 40 companies. While topping results in 1929, for the most part in 1941 net profits of the chemical industry made only slight headway over 1940 because of increased taxes and other charges. Forty companies had combined profits of $197,418,345 in 1941, compared with $184,402,604 in 1940. Federal income and excess profits taxes of the 16 principal companies were $215,077,000 or 56 per cent of earnings before taxes, compared with $92,487,000 or 36.7 per cent in 1940.

What Civilian Commodities Mean to the Army

Peace-to-war commodity shifts tell the wherefore of civilian shortages, according to the *Wall Street Journal.*

Cotton in two mattress covers makes an Army shelter tent. Aluminum in 60,000 quart sauce pans makes a Flying Fortress. Material in a home radio makes two paratrooper radios.

Jute of a living room rug makes 46 sandbags. Metal in 8 electric toasters makes a 75-mm. shell case. Wool in 15 blankets equips a soldier for a year. Wool in a woman's sport suit makes 13 Army overseas caps.

Rubber in 3,400 girdles makes one jeep tire. Silk in 185 pairs of women's hose makes one Army parachute.

Hans Wolff has accepted a position as research chemist with the A. E. Staley Manufacturing Co., Decatur, Ill. He was previously research chemist for the Devoe & Raynolds Co., Inc., Louisville, Ky.

Robertson D. Ward has been elected assistant to the president of the Freeport Sulphur Co., New York, N. Y., and **Richard C. Wells** has been elected assistant treasurer.

Pure Mercury Made by General Electric

Mercury that is 99.99995 per cent pure, required for reliable operation of electronic tubes, is being made by the General Electric Co. at Schenectady, N. Y., at the rate of 0.5 ton per day. Since December 1941 more than 90,000 pounds have been prepared in a special mercury purification plant that has been set up in the Schenectady Works Laboratory.

Raw mercury, formerly obtained from Spain, Italy, and Austria, is now obtained from cinnabar mined in California, Nevada, and Oregon, and shipped to Schenectady in 70-pound capacity iron cylinders. It is treated chemically and then distilled to remove impurities. Every precaution is taken to safeguard the health of the workers, since mercury vapor is highly poisonous.

The chief use of the very pure mercury at present is in power rectifiers, particularly in plants refining magnesium and aluminum.

New Jersey Standard Expands 100-Octane Fuel Output

Sixty million dollars is being spent by the Standard Oil Co. of New Jersey to expand production of 100-octane fuel, the company's magazine *The Lamp* says. The plants should be ready for operation within 10 months. Standard's program also includes construction of several units using new catalyst processes. These plants, with those being built by other companies, will produce raw materials for Buna S and Butyl rubber and toluene for TNT.

"If plant materials can be provided without interfering with the war effort," the company says, "rubber in quantities not only for military use but sufficient to keep the country's 30,000,000 cars on the highway is attainable as a direct result of Jersey's efforts. Buna S capacity to meet these demands could be built at a cost of about $15 a car. This type of rubber was perfected as a result of the prewar Jersey–I. G. Farbenindustrie agreement."

ESMDT Courses Scheduled at Ohio State

Two classes will be trained during the summer in the ESMDT Course on Explosives at Ohio State University. The instruction will be on a full-time basis with 30 hours of instruction per week for six weeks. The first class will be trained from June 15 to July 25 and the second class from July 24 to September 3. Prerequisites for admission to either class include three years of college chemistry (general chemistry, quantitative analysis, and organic chemistry), or the equivalent in industrial experience or other special training. No tuition is charged for the training, but students are responsible for living expenses, a $5 textbook charge, and a $10 laboratory deposit. Since each class will be limited to about 75 students and more than 50 applications are already on hand for the first class, interested applicants are advised to write soon for reservations.

The explosives course is under direction of Herrick L. Johnston with the assistance of George E. MacWood and Henry E. Wirth. Inquiries or requests for application blanks should be addressed to Professor Harry E. Nold, Director, Engineering, Science, and Management Defense Training, Lord Hall, Ohio State University, Columbus, Ohio, or direct to Professor Johnston, Department of Chemistry.

Some Defense Problems

A number of problems, the solutions to which will materially aid in winning the war, have been put out by the Associated Defense Committees of Chicago Technical Societies, of which the Defense Committee of the Chicago Section of the American Chemical Society is a member. That more widespread consideration might be given these problems, a list of them is printed below. Any solutions, or ideas concerning possible solutions, should be sent to Robert C. Brown, Jr., Chairman, Associated Defense Committees, 53 West Jackson Blvd., Chicago, Ill. All communications will be held strictly confidential and will be transmitted to the proper Government authorities.

Problem 1. Materials, composite, etc., for use as armor.

Problem 2. A directable land torpedo, utilizing a new means for obtaining traction or propulsion with a range in the neighborhood of 3 miles.

Problem 3. Methods for constructing high muzzle velocity guns of reasonable fire.

Problem 4. Easily erected and dismantled portable water or fuel storage tanks.

Problem 5. Amphibian armored fighting vehicles, capable of good speed in water.

Problem 6. Methods for the destruction of antitank obstacles and wire barricades.

Problem 7. Methods for the detection of chemical agents such as toxic gases.

Problem 8. New methods for absorbing the recoil of guns.

Problem 9. Plastic material uses for war purposes.

Problem 10. Means for easily laying or constructing a track or road for vehicles over otherwise unsuitable country, such as sandy desert, swamps, etc.

Problem 11. Booby traps.

Problem 12. Antitank devices.

Problem 13. Flame-thrower designs.

Problem 14. Fuels and ignition devices for flame-throwers.

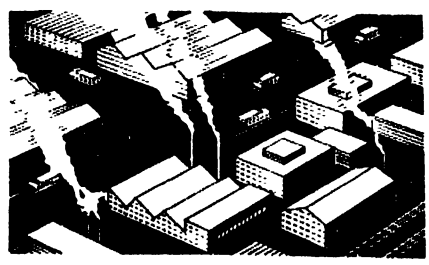
Problem 15. Revolving turret designs.

Problem 16. Portable bridge designs, easy to dismantle and assemble and capable of bearing heavy loads.

Problem 17. Light steam engines for vehicles.

Problem 18. Directionally and remotely controlled projectiles.

Problem 19. Projectile-throwers of explosive compressed air or manual-operated types.



Problem 20. New types of variable speed gears.

Problem 21. Antiskid devices for wheels which may be operated conveniently from the vehicle driver's seat.

Problem 22. Means for the propulsion of armored fighting vehicles supported in the water by flotation devices and the design of new types of flotation devices.

Problem 23. Methods of camouflage.

Problem 24. Special electrical, acoustic, optical, magnetic, and mechanical devices or instruments having application in warfare.

Problem 25. Means for protection of industrial areas against an enemy.

Problem 26. Methods of sabotage within those areas in case of invasion.

Problem 27. Provision of means in a tank for preventing the entrance of flammable liquids or gases, such as gasoline, thrown onto the tank by the so-called flame-throwers.

Problem 28. Portable means suitable for use by land troops for detecting the presence of explosive buried at depths not in excess of two feet below ground and non-magnetic in character.

Problem 29. A time delay mechanism for bombs which will have time factors up to thirty days but which do not involve clock work because of noise and which are more accurate than the present known chemical time delays.

Problem 30. Means for detecting and rendering impotent, mines ordinarily placed near shipping or port facilities and actuated by various types of trigger mechanism.

Problem 31. Lightweight means adapted for use in connection with high-speed steam turbines for transmitting the turbine energy to the propeller of a ship without sacrificing the inherent flexibility of the present turbo-electric drive.

Problem 32. A thin coating, preferably transparent, which cannot be wet by water to overcome the problem of ice formation on an airfoil surface.

Problem 33. An aircraft fuel system controlled in such manner as to prevent completely vapor lock over a wide range of barometric pressures.

Problem 34. Means suitable for use by land troops permitting the use of liquid hydrocarbons having high potential energy as explosives providing the propelling force in lightweight large calibre weapons.

Problem 35. A lightweight and highly accurate hydraulic pump capable of rapid and infinite discharge volume regulation for use as gasoline injecting means on aircraft engines, the pump to be specifically designed for construction with a minimum of close machine work.

Problem 36. A welding unit adapted to form a satisfactory high strength weld of relatively thin sheet or thin membered structural aluminum alloy.

Problem 37. The development of a harmless compound to prevent, or at least partially neutralize, the effects of seasickness without adversely affecting the capacity of the user to perform his duties.

Problem 38. Portable means for projecting an inflammable liquid to a point at least 100 yards distant, coupled with means for lighting such liquid upon contact with the target.

Problem 39. Development of a lubricant to be used in place of copper in deep drawing of steel.

WORLD-WIDE CHEMISTRY

Standards issued by the Department of National Health permit the manufacture and sale of vitamin B white flour (Canada approved) as from April 1942. The new flour has a natural thiamin content of 2.64 micrograms per gram (400 I. U. per pound). Bread from the new flour appeared on the market shortly after the permissive regulations went into effect.

Discussion in the press as to merits of the new flour has been animated, with frequent reference to the United States vitamin enrichment plan and the long-extraction flour bread now on the market in Great Britain. Nutritionists and chemists have debated the subject quite fully, and it is fair to say that the general public has been given more than the usual amount of information.

Molasses Distribution Taken under Control

Nonedible cane molasses, high-test molasses, and sugar beet molasses have been declared "chemicals". Their distribution has been taken under control as they are regarded as essential raw materials, being largely used in industrial alcohol production. A recent announcement indicates that wheat may soon be used in Canada for alcohol production.

Gasoline Rationing in Canada Started April 1

As a measure of conservation, gasoline sales were subjected to a rationing scheme as of April 1. Coupon books issued to automobile license holders control the extent of gasoline purchases. Noncommercial motor vehicles are equated according to their gas consumption so that all may be driven approximately the same number of miles per coupon used. Special categories are provided to meet the needs of particular classes whose requirements are regarded as more than ordinarily important. The initial minimum allowance per car is 60 units or 300 gallons a year, with quarterly limits.

Tourists are allowed 20 units (100 Imperial gallons) during their first 48-hour stay in Canada, and special provision has been made to meet needs of those remaining for longer periods.

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

Development of New Mineral Products Is Stimulated by War

A new development brought by the war has been the search for, discovery, and development of mineral products not formerly available from Canadian sources. The list of new products includes mercury, magnesium, tin, titanium, and tungsten. It is expected that more chromite and manganese will be produced. Cobalt production has been stimulated, and some attention has been given to output of molybdenum. During World War I Canada was an important source of molybdenum with several producing properties.

A tin concentration plant established in 1941 is working satisfactorily, and the electric furnace production of refined tin of 99+ per cent grade was commenced on a modest scale in April 1942. About two tons of tin are recovered from each 5,000 tons of tailings treated.

A new and very successful process for the manufacture of magnesium powder gives a better product than the ordinary processes at a lower cost.

Mercury is being produced for the first time in sufficient quantities to meet domestic needs with some available for export.

Medal Awarded for Magnesia Development

The medal of the Professional Institute of the Civil Service of Canada has been awarded to M. F. Goudge, Dominion Bureau of Mines, for his discovery of valuable deposits of brucitic limestone and development of a process for its concentration and the low-cost production of pure calcined magnesia in a form suitable for use in basic refractories and for making magnesium metal. His contribution has made possible the development of limestone deposits which hitherto have had little economic value.

New Plant Being Built to Produce Magnesium from Domestic Sources

The new ferrosilicon process for production of magnesium[2] worked out by L. M. Pidgeon, chemist on the staff of the Canadian National Research Council, is to be used in a large plant now under construction. Following several years of experimental work in the National Research Laboratories, a pilot plant was built by a group of leading Canadian industrialists who sponsored the development.

With full cooperation of the industry and the Department of Mines and Resources with the National Research Council, the required research and development work was done with greatest efficiency. Preparation of the raw material, domestic dolomite, was carried on in the mines laboratories while the initial experimental work and construction and operation of the pilot plant have been under direction of the National Research Laboratories. The new plant is being put up by the same group of industrial leaders with support of the Dominion Government.

National Research Council Helps Solve War Problems

In the National Research Laboratories at Ottawa, work has been expanded in several directions because of the war. In the chemistry and biology divisions especially the selection and testing of suitable materials for use of the armed forces has been a major problem. Specifications for materials normally bought in England had to be revised to conform with Canadian practice. All kinds of supplies had to be tested to determine whether they were acceptable according to required standards. Technical advice has been given as requested by the services in the specialized fields of science in which the council members are trained. Food storage and transport under war conditions presented many difficulties. Lack of refrigerated space and indeed lack of ocean shipping space made it necessary to devise new methods of handling perishable foodstuffs. The tremendous increase in volume of merchan-

[2] Killeffer, D. H., "Magnesium from Dolomite by Ferrosilicon Reduction", CHEM. ENG. NEWS, 20, 369 (1942).

dise being shipped and the limited number of cargo vessels available require that the best possible use be made of every inch of space. Refrigerated shipping space in vessels is now very limited, and serious problems have arisen in connection with the transport of the large volume of bacon to Great Britain. By use of portable refrigerating units and other devices it has been found possible to convert the ordinary uninsulated cargo hold into a refrigerated space for perishables.

Output of Industrial Minerals Is Increased

Those minerals which are used in industry in the raw or partly processed form were produced in Canada in 1941 to the value of $82,000,000, marking a gain of $13,000,000. The importance of these minerals is emphasized by the statement that the production of metals such as nickel, copper, lead, zinc, and aluminum, leading metallic minerals in Canada's long list, is directly dependent on adequate supplies of refractory materials for furnace linings, while the output of many chemical products is contingent upon the supply of such commodities as common salt, sodium carbonate, and sodium sulfate.

Some industrial minerals are not available from Canadian sources in adequate quantities for present needs. In this group are fluorspar, graphite, china clays, tungsten ores, chromium, and manganese. Iceland spar for optical instruments and quartz crystals with piezo-electric properties also are not available.

Research on Sulfite Liquors Encouraging

In Canada there are two plants making bakers' yeast from sugars present in sulfite liquor from pulp mills and one plant producing synthetic vanillin from the lignin fraction. Experimental work in the National Research Laboratories has shown that sulfite waste liquor may be readily converted into a suitable culture medium for the growth of fungi. Fungi are being used because they are among the most active of the microorganisms that break down the native lignin in plant materials in soils and composts. Many types of fungi have been tried and in general it appears that soil fungi offer more promising possibilities than do wood-destroying types. Several papers have appeared on this work recently in the *Canadian Journal of Research.*

Aluminates of Calcium Discussed by Thorvaldson

Thorbergur Thorvaldson, president of the Canadian Institute of Chemistry, recently spoke before members of the eastern Canadian branches of the institute on the structure of anhydrous and hydrated calcium aluminates and their relation to disintegration of cement. Professor Thorvaldson is head of the Department of Chemistry at the University of Saskatchewan at Saskatoon and has conducted research on cements for many years.

Canadian Chemists to Meet in Hamilton

The 1942 Canadian Chemists' Convention will be held in Hamilton, Ontario, June 1 and 2. Housing facilities will be provided for visiting chemists and guests at McMaster University.

S. J. Cook

140 Broadway Ave.
Ottawa, Ontario
April 28, 1942

Little change is reported from British chemical markets, but the control system continues to grow. Latest development is the formation of a special department in the Miscellaneous Chemicals Control to deal with raw materials for the paint industry, although not all materials for the paint trade are under supervision of the new department which will have to maintain close contacts with other authorities. Self-government in industries consuming chemical products has made progress through establishment of a Rayon Council and a consulting council for the glass trade. Both these new bodies will help to rationalize production, an objective which cannot but affect the sale of chemicals. The paint industry has applied for Essential Works status, but the Ministry of Supply is preparing an alternative scheme for organization on a speciality basis. In any case production will be curtailed as far as is consistent with war needs. Rationalization in the manufacture of glass substitutes and antiscatter treatments is to be achieved by an order of the Ministry of Works which restricts their production to 36 types of glass substitutes instead of over 300 now on the market and 23 types of antiscatter treatment instead of 250. War emergency standard specifications have been issued for red lead ready-mixed paints. Production and supply of China clay have been made subject to license.

Record Highs Expected in Spring Fertilizer Consumption Statistics

When statistics are available, consumption of chemical fertilizers in British agriculture this spring will probably be the highest on record, thanks to increased acreage and official encouragement of fertilizing. As potassic and phosphatic fertilizers are in short supply and sold only for special purposes, however, the chemical balance of artificial fertilizing may be upset with detriment to the quality of the crop. To ensure that all available supplies of phosphates are used now, forward sales of potassic and phosphatic fertilizers have been prohibited until the middle of June.

A means of increasing the fertilizer effect of ammonium sulfate is the sprinkling of wetted straw with the chemical, sufficient powdered chalk being added to keep the whole slightly alkaline. The resulting material, which is called synthetic farmyard manure, must be kept moist and turned at intervals of 1 to 2 months until it is rotted down. It is an example of the growing use of chemicals in agriculture for the treatment of waste products. Another illustration is the treatment of straw with sodium hydroxide for feeding purposes.

New Type of Synthetic Plastics Made in England

Methyl silicons are new types of synthetic resins made in England. They are condensation products prepared by hydrolyzing methyl silicon chloride, bromide or iodide. The density is stated to be 1.19 grams per cc.; the refractory index 1.423. The material contains an average of 1.41 methyl groups per silicon atom. It oxidizes at 300° C. but may in a vacuum be taken to 550° C. without adverse effect. It is insoluble in water, alcohol, and glycol, and clear, colorless, and nonsticky if solid, but similar products are prepared in a solvent like ether for liquid coating compositions for use on metal wires, glass fiber, asbestos, and mica products. The solid product retains its shape at very high temperatures and in thermosetting properties is superior to all other known silicons. Applications suggested for the new materials are concerned mainly with electrical insulation, heat resistance, sealing of vacuum-tight joints, and improvement of known coating materials.

Metal of Higher Purity from Light Metal Scrap

The increased utilization of light metal scrap makes the selection of suitable chemicals for fluxes a matter of increased importance. Most fluxes in use contain an alkaline fluoride, usually sodium fluoride or cryolite, as the oxide remover and another substance to lower the melting point. For the latter purposes calcium, potassium, or sodium chloride, and calcium and sodium carbonate are employed. There is a tendency to improve and differentiate the properties of fluxes to meet

special requirements and to recover metal of a purity grade which permits its use for purposes where secondary metal would normally not be employed. Alkali borofluorides and double chlorides of titanium or vanadium are used to introduce these elements.

Lac Solutions Used with Metallic Pigments

Use of certain lac solutions in connection with metallic pigments such as bronze and aluminum, for which spirit varnish cannot be used because of its acidity, is suggested by the Shellac Research Bureau. When solutions of lac in methylated spirit are refluxed with certain metallic oxides, viscosity increases. The formation of the salt of lac is not the only reaction which occurs and the product can be dissolved in the usual organic solvents generally used for the resin, giving solutions possessing abnormally high viscosities. Solutions obtained by refluxing with metallic oxides or by adding aqueous solutions of metallic salts to alkaline solutions of lac give hard and glossy films which possess increased toleration for plasticizers. Basic pigments, such as zinc oxide and white lead, can safely be incorporated into lac varnishes treated with suitable metallic oxides.

Many Applications Found for Synthetic Magnesium Silicate

Synthetic magnesium silicate was mentioned by C. S. Garland in the presidential address to the Institution of Chemical Engineers. It is made from chemically prepared magnesia and quartz and is distinguished by having the lowest loss factor for high frequencies of any product so far known. It lends itself to sawing, grinding, drilling, and shaping, is very hard, tough, and elastic, possesses high compressive strength, and takes a high degree of polish. Synthetic magnesium silicate may be varied in its properties by application of suitable temperatures in firing. When the firing was stopped at 900° C., a product hard enough for handling and working and yet soft enough to be treated in the same way as a nonferrous metal was obtained. Synthetic magnesium silicate provides a good material for water-lubricated gears and bearings; it may take the place of mica in many connections concerning the construction of resonant circuits, and it plays an important part in short-wave transmission.

Imperial Chemical Forms Pharmaceutical Subsidiary

Imperial Chemical Industries, Ltd., has announced formation of a new subsidiary, I. C. I. (Pharmaceuticals), Ltd., with a capital of £500,000 (equivalent to $2,000,000). Together with organisation of the Therapeutical Research Corp. by Boots, British Drug Houses, Glaxo, May & Baker, and Wellcome Foundation last November, this is the most important chemical company formed in wartime. The latter company was also capitalized with £500,000, but it was to engage solely in research, whereas the new I. C. I. subsibidary is to act as manufacturers and dealers of fine chemicals, scientific apparatus and materials, oils, colors, dyeware, etc., as well as conducting research on a large scale. The British pharmaceutical industry has been faced with many problems which could not be foreseen when war broke out. Full cooperation and coordination, not only of industrial capacity but of research, has been necessary to meet requirements of the Government and armed forces. While civilian consumption of medicinal products is restricted and as far as possible directed into channels where essential goods in short supply are not affected, output of British pharmaceutical factories must be increased further.

German Manufacturer's Rights Are Acquired

The stocks, good will, and British rights of Schering, Ltd., a subsidiary of the German pharmaceutical manufacturers, were acquired in August 1941, by a British group from the Board of Trade. Three associated companies are now stated to be in active operation: British Schering Research Laboratories, Ltd.; British Schering Manufacturing Laboratories, Ltd.; and British Schering, Ltd. The latter handles distribution.

Special Grade Glauber's Salt Is Made in England

Granular, free running, desiccated Glauber's salt, technically free from iron (corresponding to the old German Duisburg standard), is now being made by a British firm.

Activated Gas-Coke Used for Gas Producers

Use of producer gas as a substitute for liquid motor fuels has made great headway in Great Britain as in Continental Europe during the past two years, although progress has necessarily been retarded by the need to conserve supplies of construction materials and engineering products for suitable equipment. For this reason the British government has abstained from encouraging extension of gas generator propulsion for road vehicles, while on the Continent all kinds of solid fuels are being used for gas producers, including soft wood, charcoal, anthracite, lignite, and turf briquets. In Great Britain the emphasis has shifted markedly toward gas coke of special quality treated with sodium carbonate to give high reactivity. Alkali-activated gas coke and specially prepared low-temperature cokes appear to be the best fuels for operating portable gas producers, and the opinion is expressed that, if the need should arise, a considerable proportion of the British road transport could be transferred from gasoline to producer gas. As for the economic side, one road transport enterprise which has up to now used producer gas vehicles over an aggregate of more than 1,000,000 miles reports that the cost of operation is higher than in the case of Diesel oil but lower than with gasoline. Provided the supply of suitable fuels at reasonable price is adequate, at least part of the British road transport system may permanently be served by producer gas vehicles on the basis of anthracite and activated coke.

No More Tartaric Acid to Be Available to Bakers

Supplies of tartaric acid and cream of tartar in Great Britain have been on a limited scale for a long time. The Ministry of Food has announced that when the present small stocks are exhausted further quantities may not be available for the baking industry. Pyro cream powder and calcium phosphate which are still available are mentioned as suitable alternatives.

Cooperation in Research on and Utilization of Fuel Urged

The growing demands for coal and other fuels, in the face of a limited output which cannot be increased unless miners are released from the armed forces, will before long compel the authorities to introduce fuel rationing. A system based on point rationing of coal, gas, and electricity is foreseen and will help conserve fuel for essential industrial purposes. The need to save coal is reflected in the fuel economy drive of the authorities and in efforts to reduce fuel demands as a whole by selection of manufactured fuels for purposes where they have a definite advantage.

These developments have an acute bearing on fuel research. E. W. Smith, director-general of gas supply, made a plea for coordination of research between the British Coal Utilisation Research Association, Gas Research Board, coke research organizations connected with the coking industry, and fuel research of the iron and steel industries. Under the direction of a first-class administrator separate directors should be responsible for each branch of the work. The actual research men ought to be able to devote their time to thinking

and directing, while the analytical work and other odds and ends should be done in the affiliated service departments.

Tin Economy Affects Welsh Tinplate Industry

Changes in the tin supply position have necessitated important economies in the use of tin for various industrial purposes, and the tinplate industry, which despite diminution of the export trade is still one of the principal tin consumers in the British Isles, has to contribute materially to the savings. The effect of these changes on the chemical trade is twofold. On the one hand, tinplate is replaced in many cases by lacquer-coated sheets for which chemicals are required. On the other hand, the need to economize in the use of tin where tinplate is essential gives an advantage to methods of production which help save tin by keeping the coating as thin as possible. The alkaline tinplating process has been used for some time and is applied widely where fabricated articles from steel, copper, bronze, etc., are to be coated with tin as light as 0.0025 mm., although thick coatings to 0.075 mm. are also possible. The constituents of the alkaline tinplating bath are sodium stannate, the tin usually obtained from scrap tinplate, caustic soda, sodium acetate, and hydrogen peroxide. Organic agents are occasionally added.

Paper Stock Shortage Reported from Dublin

An unfavorable situation in Irish paper stocks, due to declining imports, is reported from Dublin. Prices for newsprint, among other items, have advanced to an extent that Dublin papers have been forced to increase their price per copy.

Apart from certain small shipments of newsprint paper arranged for, there is said to be little prospect of further imports of this type and the small output of domestic mills is not sufficient to help the situation. Excluding newsprint, the annual amount of paper and cardboard imported has ranged around 27,000 tons, but under current conditions imports will be only about one fifth of that.

Plans are under way at one of the largest mills of the country to use wheat straw for paper production, thus utilizing extensive accumulations of a ready material which will not affect other requirements.

All iodine imported by Guatemala is for medicinal purposes except for a small quantity used by a leading lithographer. Imports have averaged 291.5 pounds annually in 1938–41, but fluctuate from year to year.

War Stimulates Brazil's Demand for Chemicals

Active demand for chemicals in Brazil during the past year is attributed to a number of conditions partly arising from the war. Restricted shipments of goods from abroad with consequent stimulus to local production have led to industrial demand for chemicals, such as a need for refrigerants by a plant contemplated at Rio de Janeiro for refrigerating oranges. Plants, either actually operating or planned, will make airplane motors, plastics, glass, sodium hydroxide, beverages, cement, aluminum, paper, cloth sacks, and textiles from native fibers—all requiring imported chemicals of various kinds.

Sales of Insecticides to Paraguay by U. S. Slump

A great drop in United States sales of agricultural insecticides to Paraguay is indicated by latest reports. In 1939 the United States shipped 31,300 pounds valued at $5,600, compared with 800 pounds at $65 value in 1940. Meanwhile advertisements have appeared in the press of the country for lead arsenate, sulfur, sodium nitrate, potassium sulfate, and carbon disulfide.

Bulk of Chile's Potassium Chlorate Comes from U. S.

The United States in 1940 supplied 60 per cent of Chile's requirements of imported potassium chlorate. The total incoming shipments amounted to 133,600 kg. While this compares with 137,000 kg. the year before, there has been a decided shift of emphasis on origin of supplies. In 1937 and 1938 Germany furnished nearly all such imports by Chile, while in 1939 Finland and Sweden supplied the bulk. The commodity is used principally in manufacture of matches, and to a lesser degree by the pharmaceutical industry in preparing antiseptics, astringents, gargles, and mouth washes.

Brazil Is Important U. S. Gluestock Source

Brazil has, in the past two years, assumed an increasingly important place among sources of glue-making materials for the United States, according to recent trade figures. For the first nine months of 1941 imports of hide cuttings from Brazil into the United States amounted to 830,000 pounds valued at $18,400. In the previous year these figures were 655,150 pounds at $11,600 for the calendar year, and none at all in 1939.

The state of Rio Grande do Sul is the largest livestock raising district in Brazil, and large amounts of hide fleshings, or gluestock, are available from meat packing plants, jerked beef manufacturing plants, and tanneries. The two most important packing plants are branches of American firms which ship gluestock products regularly to their headquarters in the United States.

Numerous meat plants and tanneries scattered throughout the state and varying in size and importance produce a fairly large amount of such materials. Only a part is absorbed in the domestic glue industry. Packing plants probably purchase a good percentage for eventual export, and it is believed that practically all hide fleshings suitable for glue manufacture are shipped dry to other points either abroad or in Brazil.

El Salvador Ceases to Import Potassium Chlorate

No imports during 1941 of potassium chlorate were reported from El Salvador, where formerly the chemical was required in match manufacture and for locally hand-made rockets and bombs used in public celebrations of holidays and other occasions, as well as for pharmaceuticals. In 1940 imports were nearly 10 short tons and in 1939, 14 short tons.

Brazil Produces 400 to 500 Tons Carnauba Wax Yearly

Brazil is estimated to have an annual production of carnauba wax in Bahia state of between 400 and 500 metric tons annually. Production in 1941 was indicated at 450 tons, compared with 350 for the previous year. The only grade produced in Bahia is a fatty grease type. The entire output is exported, the latest figure amounting to 439,766 kg., of which 96 per cent was destined for the United States.

Demand in Peru for Sodium Hydroxide Gains

Peru reports an expanding demand for sodium hydroxide incident to increased activity of the soap, lard, and oil industries which use this product, in addition, to sugar factories, textile and paper mills, and mining concerns. The upward trend has been noted particularly for 1939, 1940, and 1941, with the United States and United Kingdom supplying the bulk of Peruvian requirements over the past 10 years.

Canada to Pipe Petroleum for Synthetic Rubber from U. S.

Canada is formulating plans to manufacture synthetic rubber from petroleum piped from the midcontinent fields of the United States, according to the U. S. Department of Commerce. Work on a plant to be erected in Sarnia, Ontario, the terminus of Imperial Oil's pipe line, will be started "as soon as possible" and is expected to be completed in 15 months.

Supreme Court Decides Ethylene Oxide Suit

Thomas F. Healy, Munsey Bldg., Washington, D. C.

On March 30, 1942, the Supreme Court of the United States handed down a decision holding that Reissue Patent No. 20,370 is not for the same invention described and claimed and intended to be secured by the original patent and, therefore, is void.

By way of background, the suit in the District Court was based upon claims 8 and 9 of Reissue Patent No. 20,370, dated May 18, 1937, which the plaintiff, the Carbide & Carbon Chemicals Corp., acquired by assignment from one Theodore Emile Lefort, of Paris, France, to whom the original United States Patent No. 1,998,878 was issued on April 23, 1935, upon application dated March 22, 1932. This original patent was based upon a process developed by Lefort in France, and patented there March 27, 1931.

The process for preparing ethylene oxide, as described and claimed in the original patent, consisted substantially in the passage of a mixture of ethylene gas and air through a tube containing a silver catalyst heated to a controlled temperature between approximately 150° C. and 400° C. The direct combination of the oxygen in the air with the ethylene produces ethylene oxide.

In carrying out the process, a side reaction also occurs in which there is a destructive oxidation of some of the ethylene, producing carbon dioxide and water. It is pointed out in the original patent that the efficiency of the ethylene oxide-forming reaction is increased by diminishing the carbon dioxide formed in this side reaction, as by introducing water or carbon dioxide into the reacting gases. The effect probably is caused by the partial pressure of the water or carbon dioxide gases introduced.

Several examples are mentioned in the specification of the original patent illustrative of the operation of the process, but nowhere in them, or in the original claims, is the introduction of water treated as optional or permissive.

Carbide and Carbon Chemicals Corp. after acquiring the title to the original patent, applied for a reissue patent realizing that ethylene oxide could be produced by passing ethylene and air over a catalyst at the temperature described in the original patent without the voluntary introduction of water into the reaction zone. A reissue patent was allowed with additional claims 8 and 9 which were broader than the original claims by the omission of the step of positively introducing water in one form or another into the reaction mixture. The argument advanced for the allowance of reissue claims 8 and 9 was bottomed upon the fact that a certain amount of water was necessarily present in the reaction chamber, owing to the side reaction which gives carbon dioxide and water, and that the introduction of additional water or carbon dioxide was merely permissive in order to augment the quantities already formed by that side reaction.

The suit was initiated in the U. S. District Court for Maryland by the Carbide and Carbon Chemicals Corp. against U. S. Industrial Chemicals, Inc. The District Court held the reissue patent valid and infringed (34 F. Supp. 813.). The Circuit Court of Appeals affirmed the decision (121 F. 2d. 665.).

The Supreme Court, in reversing the decisions of the lower courts, took the position that the original patent included a step of introducing water into the reaction, which step originally was not designated as optional or desirable but described and claimed as an integral part of the whole operation in preparing ethylene oxide. In contrast, the reissue patent treats this step of introducing water as immaterial or optional and for the mere purpose of controlling the temperature in the reaction zone, a thought not even suggested by the specification of the original patent.

In effect, the reissue patent omitted the step of positively introducing water in the process of preparing ethylene oxide, which step was described, claimed, and considered as essential in the original patent when viewed in the light of its context. The Supreme Court has uniformly held that the omission from a reissue patent of one of the steps in a process, which step was considered essential as described in the original patent, thus to broaden the claims of the reissue to cover a new and different combination of process steps, renders the reissue patent void, even though the result attained is the same as that brought about by following the process claimed in the original patent.

Process for Nonfogging Materials Patented

The nonfogging properties of such military items as gas masks, respirator eye and face pieces, and observation panels of aircraft would be increased by processes described in four United States patents granted to Celanese Corp. of America, New York, N. Y. All four patents, 2,280,055, 2,280,097, 2,280,098, and 2,280,452, relate to nonfogging sheet material made of cellulose acetate or similar material.

The material may be made by superficially saponifying one side only of cellulose acetate sheet material so that one side is more capable of absorbing moisture than the other. The nonfogging material can also be made by laminating a sheet of cellulose acetate resistant to moisture with another sheet of cellulose acetate material capable of absorbing moisture readily.

Patents on Stretching Artificial Cellulose Acetate Yarns

The Celanese Corp. of America, New York, N. Y., has been granted United States patents 2,279,478 and 2,279,479 relating to a process and apparatus for the stretching of artificial cellulose acetate yarns, foils, and similar materials.

Staple-Fibers of Cellulose Acetate

A refinement in the process of making staple fibers of cellulose acetate for the manufacture of fluffy or napped fabrics, either woven or knitted, which do not readily shed the individual fibers is indicated in U. S. Patent 2,281,647 granted to the Celanese Corp. of America, New York, N. Y. As a result of this discovery it is possible to use cellulose acetate staple fibers for the manufacture of fabrics suitable for making blankets, ski suits, lumber jackets, and other similar materials.

Monsanto's President Advocates Suspension of 40-Hour Week

Suspension for the duration of the war of the 40-hour week, patent laws, antitrust laws, and adoption of a firm attitude by the Administration on such controversial issues as the closed shop and the check off to permit unhindered pursuit of the war production program were advocated by Edgar M. Queeny, president of Monsanto Chemical Co., at the recent annual meeting of Monsanto stockholders in St. Louis. His comments were in answer to a question put by a stockholder from the floor.

He stressed that the 40-hour week has not as yet hampered Monsanto construction or operation, even though the company's plants have operated around the clock seven days a week for years. He said, however, that the limitation on hours had increased the cost of construction and in some cases the cost of operation. But these additional costs, he stated, have been borne largely by the Government, either because the Government is paying for plants or because the extra production costs caused by overtime payment have reduced profits which, in turn, have reduced the company's federal tax contribution to the extent of 72 per cent.

POTOMAC POSTSCRIPTS

WPB Activities

Alcohol. Beverage alcohol from 100 to 189 proof, known in industry as "high wine", is placed under complete allocation control in Amendment 1 to Order M-69. Distillers must deliver specified quantities to rectifying plants for redistillation into 190 proof alcohol to augment the Nation's industrial alcohol supply. Each producer also is required to report to the Chemicals Branch, WPB, the quantity of high wine his distillery is capable of producing and his entire storage facilities.

Diversion of beverage alcohol is not expected to curtail seriously the supply of whisky in the country as only a few days' run from each distillery will be required. Use of high wines to make industrial alcohol is being carried on voluntarily by 25 distilleries at the request of WPB, and the new order will make possible extension of this program throughout the country.

Aluminum and Magnesium Plants. Suppliers of materials used in construction of vital aluminum and magnesium plants have been advised by WPB that deliveries should be made on schedule even though subsequent orders assigned under Preference Rating Order P-19-i carry higher preference ratings. The ruling was made in Interpretation 1 of P-19-i which covers materials used in essential civilian construction. It was necessary, WPB said, to prevent any delay in delivery which might result from a misunderstanding of the original order.

Antifreeze. Production of antifreeze is placed upon a quota basis by Order L-51. Quotas have not yet been set, but they are expected to approximate 50 per cent of the amount of antifreeze sold by each producer in 1941. Antifreeze manufactured for the Army, Navy, other governmental agencies, Lend-Lease, or for the governments of the British Empire, Belgium, China, Greece, the Netherlands, Norway, Poland, Russia, and Yugoslavia may be made in addition to quotas.

Buna S Synthetic Rubber. WPB has authorized the Reconstruction Finance Corporation to provide facilities for an annual productive capacity of 700,000 tons of Buna S synthetic rubber to be in operation not later than the end of 1943. This represents an increase of 100,000 tons in the Buna S program previously authorized by the War Production Board, and is in addition to the planned capacity for butyl synthetic rubber and neoprene totaling 100,000 tons.

The 700,000-ton Buna S program is to be given all the priority and allocation assistance needed to assure the production of not less than 350,000 tons during 1943. All the synthetic rubber to be produced for many months must be reserved for military uses, and none will be available for civilian uses.

Cellophane. Charging willful violation of the cellophane limitation order, WPB has withdrawn all priority assistance from the Everett Sales and Equipment Corp., New York, for one month and at the same time prohibited the firm from accepting or delivering any cellophane or similar transparent material derived from cellulose. After May 10, 10 days after the effective date of Suspension Order S-44, the Everett company was also enjoined from cutting or processing any cellophane.

Chlorinated Solvents. Changed preference ratings for all permitted uses of chlorinated hydrocarbon solvents have been announced with amendment of Order M-41. The order extends A-10 ratings for such solvents to be used in the fumigation of stored products, including grain; for charging and recharging fire extinguishers; for laboratories, hospitals, and public institutions; for processing and manufacturing food, chemicals, rubber, petroleum, and plywood; for cleaning metal parts of electrical equipment; for manufacture of refrigerants; and for degreasing machines used in manufacture of war materials.

B-2 ratings are assigned for degreasing machines other than those used on Army and Navy contracts; for packaged spotting and cleaning preparations; for dry cleaning establishments; and for manual cleaning of other than metal parts of electrical equipment. No other uses of chlorinated hydrocarbon solvents are permitted, with the exception that quantities up to 1 gallon may be purchased without a preference certificate or a rating. B-2 ratings are restricted to 50 per cent of average monthly consumption in the base period set up in the order. The previous order was due to expire on May 15.

Chlorine. Because the wording of Order M-19 relating to chlorine would have required the filing of monthly reports by thousands of retail stores, it has been amended to remove that provision. The reports never have been required because the effective date of the order was postponed to permit the changes announced.

Electric Power. When WPB issued Order L-94 recently, it set up machinery to handle power shortages wherever and whenever they occur in this country. Two main lines of action against power shortages are set out in the order. The first, which went into operation at once, requires each utility to operate its facilities and interchange power with other utilities in a manner that will "achieve the maximum coordination of power supply for war production and essential civilian uses, and for relief of power shortages". Such operations include making available the maximum amount of power at peak periods, using water power as much as possible to save fuel, and maintaining as much reservoir storage as possible. No utility is permitted to abandon any of its generating facilities except upon authorization by the WPB.

The second part of the program, which will be put into operation when and where a shortage occurs, establishes machinery for mandatory curtailment of power from commercial, industrial, and residential consumers. Consumers exempt from the curtailment consist of governmental and community services, such as street lights and power for hospitals and schools; transportation services; communications services; military establishments; and plants engaged exclusively in war production.

Indian Kyanite, including andalusite and sillimanite, a super-duty refractory used in furnaces where extremely high temperatures are necessary, has gone under complete allocation control. The order, M-143, provides that delivery, consumption, and processing of Indian kyanite, both future imports and present stocks in the United States, are subject to specific authorization. Consumption is restricted to necessary uses. Suppliers and consumers using kyanite in the manufacture of a refractory must file with WPB monthly reports on Form PD-466.

Metallic Coatings. Schedule V to Order L-42 prohibiting the use of metallic coatings for finishing purposes has been revised to bar the use of chromium, nickel, cadmium, copper, and copper-base alloy only. This action was taken after the Lead and Zinc Branches of the Materials Division advised that at present quantities of lead and zinc are sufficient to supply the small amount needed for finishing purposes. The amendment also removes all restrictions on the use of materials in fitting and trim made for chemical plants, research laboratories, hospitals, vessels other than pleasure craft, and airplanes, where use of noncritical materials is impractical.

Naphthalene. Distribution of naphthalene will be under rigid allocation control, commencing June 1, by terms of Conservation Order M-105. After that date, except for certain exempted types of delivery, all naphthalene shipped by a producer or distributor must be delivered in accordance with schedules issued by the Director of Industry Operations at the

beginning of each calendar month. Intracompany or intraplant deliveries of naphthalene are subject to the restrictions if the deliveries are made for further processing or manufacturing into another product. Users of naphthalene desiring allocations of the chemical should make application on forms PD-434 and PD-435.

Naphthenates and naphthenic acid will also go under strict use and allocation control June 1. Use of driers containing more than 40 per cent of naphthenates by weight in the manufacture of paints and varnishes is restricted to orders rated A-2 or higher, and use of naphthenates is restricted to orders rated A-10 or higher. Inventory allocation and other restrictions do not apply to imported naphthenic acid. Form PD-439 is provided for applications for naphthenic acid and Form PD-438 for monthly reports from producers.

Phosphate Rock. Order M-149 removes the minimum working inventory restrictions of Priorities Regulation 1 and any other inventory restrictions, in so far as they apply to phosphate rock, to permit consumers to take advantage of transportation facilities when they are available. Approximately 75 per cent of phosphate rock is used in production of fertilizers. The remainder is used in chemical warfare, manufacture of baking powder, and soaps, water-softening compounds, and boiler cleansers.

Rubber Substitutes of the general type of Koroseal and Vinylite have been made subject to direct allocation by an amendment to General Preference Order M-10. The order as originally issued in June 1941 and amended last December included only polymerized vinyl chloride and its copolymer with vinyl acetate, containing 92 per cent or more of vinyl chloride. The new amendment brings under the restriction all copolymers of polyvinyl chloride and all copolymers and polymers of vinyl chloride.

Totaquine. Distribution and use of totaquine, except as an antimalaria agent, has been prohibited to prevent an evasion of the intent of Conservation Order M-131 on quinine. After issuance of the original quinine order on April 4, some drug manufacturers began to use totaquine, which was not covered by the order, for the same purposes for which quinine had been prohibited.

Totaquine is a substance made up of several of the alkaloids extracted from cinchona bark, and containing some quinine. The substance had never before been produced commercially in this country. The amended order requires that the primary use of cinchona bark must be for the extraction of quinine or totaquine, and limits the use of the latter substance to antimalaria purposes. Quinine may be used for two additional minor medical purposes.

Zinc Sulfide Pigments. A monthly producer's pool in zinc sulfide pigments, of which lithopone is the principal product, has been established. Order M-128 provides that the Director of Industry Operations will set up by the 15th of each month a percentage of all classes of lithopone manufactured, to be set aside for the following month. Mandatory orders will be filled from this pool, after which other production may be sold without restriction. Exports of lithopone other than Lend-Lease cannot be made except upon application to the War Production Board on Form PD-464.

Prices on Machines and Parts Set

A COMPREHENSIVE regulation establishes maximum prices for machines and parts not covered by other price schedules. All outstanding "freeze" letters and informal agreements covering machinery are superseded by the new measure, Maximum Price Regulation 136, part of OPA's overall formal price stabilization program.

Effective May 18, the regulation specifies October 1, 1941, prices for the machines and parts it covers at all levels of distribution except retail. October 1 rentals for machines are also established as maximum rentals. Specifically excluded are certain subcontracted parts and subassemblies manufactured for incorporation into another machine by the buyer. This will exclude many specially-designed parts for munitions. Informal price action is expected in this field in the near future. The arms production expansion program is still in a transitional phase through farming out of parts orders by prime war goods contractors, and OPA deemed it impractical to draw up maximum regulations for such items until the production cost picture had further jelled.

The regulation also states formulas for maximum prices for rebuilt used machines and parts and other second-hand units.

Commodities Allocated to American Republics

ADDITIONAL commodities have been allocated to the other American Republics for the second quarter of 1942. The list, announced jointly by the Department of State, Board of Economic Warfare, and War Production Board, supplements allocations announced on April 4 and comprises the following materials: iron and steel, lead, natural amorphous graphite, fluorspar, uranium salts and compounds, ascorbic acid, thiamine hydrochloride, sulfanilimide, sulfaguanidine, cranes, hoists, and derricks, and mechanical household refrigerators.

Pennsylvania Salt Plans War Plant

CONSTRUCTION and operation of a new plant in the Philadelphia area for manufacture of materials used in war production have been arranged between the Government and the Pennsylvania Salt Manufacturing Co. Financing of the plant, expected to be in operation within six months, will be provided by the Defense Plant Corporation and is expected to involve $1,750,000.

Priorities Listing Revised

PRIORITIES in Force", issued by WPB's Division of Information, has been revised to include the original booklet and weekly supplements in one complete alphabetical listing through March 31, 1942. Copies may be obtained from Room 1501, Social Security Building, Washington, D. C.

Hearing on Canned Shrimp

A PUBLIC hearing to gather evidence for standards of fill of container for canned wet pack shrimp and canned dry pack shrimp, in nontransparent containers, will be held at 10:00 A. M., June 3, in Room 1039, South Building, Independence Avenue between 12th and 14th Streets, S. W., Washington, D. C. The full notice is published in the *Federal Register* for May 2, obtainable from the Superintendent of Documents, Government Printing Office, Washington, D. C.

1942 Fertilizer Sales Rise

MARCH fertilizer sales, as indicated by the sale of tax tags and reported by the National Fertilizer Association, amounted to 1,156,000 tons in the 17 reporting states. This represented a decrease of 22 per cent from March 1941. However, total sales for the first quarter of the year were 24 per cent greater than for the corresponding period of 1941. The picture is abnormal this year due to early buying of fertilizer by the farmers, as the seasonal peak normally occurs in March.

New Synthetic Ammonia Plant Planned

PLANS for the immediate erection of a plant that will substantially increase our supply of ammonia and its derivatives have been announced by Mathieson Alkali Works, Inc., New York, N. Y.

In accordance with the terms of the contract the new plant will be financed by the Defense Plant Corporation and will be erected and operated under lease by the Mathieson organization. The ammonia will be produced synthetically through the use of a modification of existing methods.

Swift Sponsors University Nutritional Studies

The University of Rochester has received from Swift & Co., Chicago, a grant to be used under direction of John R. Murlin in a study of meat protein intake and efficiency. This work will involve a study of meats as compared with other high-protein foods as sources of muscular energy and a study of the influence of high-protein diets on muscular efficiency and muscular endurance at different rates of work. Dr. Murlin is professor of physiology and director of the Department of Vital Economics at the university and is chairman of the Committee on Research, Food and Nutrition Board, National Research Council.

A Swift grant at Pennsylvania State College for 1942 will be used under direction of R. Adams Dutcher in the study of factors influencing the value of pork as a source of the vitamin B complex in the human diet. R. C. Miller, Department of Agricultural and Biological Chemistry, and P. T. Ziegler, meat expert in the Department of Animal Husbandry, will also participate in the work. Professor Dutcher proposes to study the vitamin B complex content of pork from the standpoint of feeding of the hogs from which the pork originated, handling and storage of the meat before reaching the consumer, various commercial processing methods, and various cooking methods.

At Cornell University a Swift fellowship has as its main purpose work on the riboflavin content of foodstuffs. Included in the investigation will be the determination of the effect of manufacturing processes and cooking upon this vitamin in ordinary foods. This award has been made jointly to L. A. Maynard and L. C. Norris.

The University of Chicago also has received from Swift & Co. a grant to be used under the direction of Alexander Brunschwig for research in parenteral alimentation with fat. Knowledge gained from this study will be of particular value in the nutrition of patients undergoing major surgical operations and patients suffering from certain diseases. Dr. Brunschwig is professor of surgery at the University of Chicago.

A Swift grant at Kansas State College of Agriculture and Applied Science for 1942 is to be used to support work on the nutritive properties of dried eggs. R. M. Conrad, assistant professor of poultry chemistry, will direct the investigation. The effect of spray drying procedure on the nutritive value of eggs, and the effect of the diet of the hen on the stability and the food value of the dried product are important factors that will be considered. The need for stable and concentrated food products that will keep until consumed and that require the least amount of shipping space is of pressing importance.

In a talk entitled "Industrial Efficiency from the Point of View of Industry and the Manufacturer", delivered by James F. Lincoln, of the Lincoln Electric Co., Cleveland, before the convention of the Associated Business Papers on May 7 at Seaview Country Club, Absecon, N. J., the point was made that the most critical material shortage facing our war effort is manufacturing brains and skill.

Top. Audience during talks by A. C. S. Student Affiliates at the recent regional meeting at St. Thomas. *Center.* Recreation period. *Bottom.* Supper in Ireland Hall.

College of St. Thomas Student Affiliate Chapter of the AMERICAN CHEMICAL SOCIETY

Student Affiliate Chapters Hold Regional Meeting

READING of student chemical papers highlighted the regional meeting of 65 A. C. S. Student Affiliates from Hamline University, College of St. Thomas, and the University of Minnesota and their guests from other Minnesota institutions on the St. Thomas campus, St. Paul, May 3.

Eugene McMullen, Chairman of the St. Thomas Chapter, opened the afternoon session with a welcoming address answered by Robert Frericks, Chairman of the Hamline Chapter, and Allen Matthews, Chairman of the University of Minnesota Chapter. Speakers were Alfred Stepan, a senior at St. Thomas, on "The Life and Work of Father Nieuwland"; Sherman Johnsen, of the University of Minnesota, on "Dithizones"; and Leonard Brown, of Hamline University, on "Hydroponics". In the evening Lee Irvin Smith, chief of the division of organic chemistry at the University of Minnesota, addressed the affiliates on "Use of Chemicals in Warfare".

The idea of a joint meeting of the affiliate groups in the vicinity originated with James J. Carney, professor of organic chemistry and faculty adviser for the St. Thomas Student Affiliate Chapter. As general chairman of the meeting, Eugene McMullen was assisted by James B. Gergen, chairman of the Program Committee, and John F. Nobis, chairman of the Arrangements Committee.

Left to right. John Nobis, chairman of Arrangements Committee for the Student Affiliate meeting; James J. Carney, faculty adviser; Lee Irvin Smith, principal speaker; William J. Tomsicek, chairman of the St. Thomas Department of Chemistry; James Gergen, chairman of Program Committee; Eugene McMullen, general chairman.

Summer Conference on Spectroscopy

A SUMMER Conference on Spectroscopy and Its Applications, to be sponsored jointly by the Optical Society of America and the Massachusetts Institute of Technology, will be held in Cambridge at M. I. T. on July 20, 21, and 22.

A Symposium on Fluorescence and Phosphorescence is planned in connection with the conference. Admittance to the conference will be by reservation. Further information and tickets can be obtained from George R. Harrison, Massachusetts Institute of Technology, Cambridge, Mass.

The usual courses in spectroscopy will not be given at the Massachusetts Institute of Technology this summer.

M. I. T. to Give Industrial Statistics Course

THE fourth summer course in industrial statistics will be given by Massachusetts Institute of Technology from June 15 to 27. The course is intended for workers in industrial plants and scientific laboratories who would like to acquire the rudiments of modern statistical technique as applied to inspections, design and analysis of factory and laboratory experiments, and control of the quality of industrial output.

Tuition fee is $40, and registrations will be limited to 20 persons. Dormitory accommodations will be open on the campus at $1.00 per day per occupant. Application should be made to the Director of Admissions at the institute, Cambridge, Mass., and direct inquiries to the instructors of the course to George P. Wadsworth, Department of Mathematics, and Harold A. Freeman, Department of Economics and Social Science.

NEWS-MAKERS

C. E. Bergamini has been appointed chief chemist of E. F. Timme & Son, Woonsocket, R. I.

M. R. Bhagwat, formerly closely associated with welfare activities among chemists and chemical engineers in New York, first secretary and later secretary and manager of the Chemists Advisory Council, is now chemical engineer in the Research Division, Mathieson Alkali Works (Inc.), Niagara Falls, N. Y.

F. E. Bibbins

F. E. Bibbins, chief pharmacist of Eli Lilly and Company, Indianapolis, Ind., has received the honorary degree of doctor of science from Purdue University for his contributions to the science and art of pharmacy through original investigations that have resulted in new and improved medicinal products.

Johannes H. Bruun

Johannes H. Bruun has resigned his position as manager of the Experimental Division of the Sun Oil Co. to become chief, Process Development Department, General Aniline Works Division, General Aniline & Film Corp., 435 Hudson St., New York, N. Y.

William T. Caldwell, professor of chemistry and chairman of the Department of Chemistry, has been named dean of the College of Liberal Arts, Temple University, Philadelphia, Penna., succeeding **James H. Dunham,** retired.

Walter R. Carmody, formerly assistant professor of chemistry at Reed College, Portland, Ore., is now associate professor of chemistry in charge of the Physical Chemistry Division at Boston College, Chestnut Hill, Mass.

Jean F. Caul, who received his Ph.D. in physiological chemistry at the Ohio State University in March, has accepted a position as research chemist in the research division of the Biological and Chemical Laboratories of The Borden Co., Bainbridge, N. Y.

Charles M. Craighead has been named a research metallurgist at Battelle Memorial Institute, Columbus, Ohio. He was formerly associated with the Aluminum Co. of America, the Reynolds Metals Co., and the Braeburn Alloy Steel Corp.

D. Eolkin has joined the staff of the Chemical Engineering Section of the Armour Research Foundation. Mr. Eolkin was previously engaged in consulting work for a number of organizations in Minneapolis.

Walter M. Fenton, for the past three years manager of the Baker & Adamson Division of General Chemical Co., has resigned to become a member of the executive staff of S. B. Penick & Co., 50 Church St., NewYork, N. Y.

W. D. Fisher has been appointed sales representative and tool engineer for the McKenna Metals Co., in the Detroit district.

William Stanley Herbert has joined the staff of the Metallurgical Section of the Armour Research Foundation. Dr. Herbert was previously connected with the New Jersey Zinc Co. of Pennsylvania.

Howard Hopkins is now dean of the College of Pharmacy, Ferris Institute, Big Rapids, Mich.

Captain Arthur E. Huff, research scientist in the laboratories of the Organic Chemicals Division of the Monsanto Chemical Co., St. Louis, Mo., was cited May 3 in dispatches from the Philippines for bravery under vicious fire of Japanese

A. E. Huff

batteries and dive bombers in the restoration of the American flag to the top of the flagstaff at Corregidor.

Clyde W. Leaf, formerly connected with Girandau-Delawanna, Inc., has been appointed organic chemist in the Chemical Engineering Section of the Armour Research Foundation.

Arthur Linz succeeded Alan Kissock on May 1 as vice president of Climax Molybdenum Co. He will be in charge of converting operations at the company's plant at Langeloth, Penna., but will have his headquarters in New York.

C. D. Lowry, Jr., Universal Oil Products Co., addressed the University of Wisconsin Chapter of the American Institute of Chemical Engineers at Madison, Wis., May 13, on "Petroleum's War Assignments in Aviation, Rubber, and Explosives".

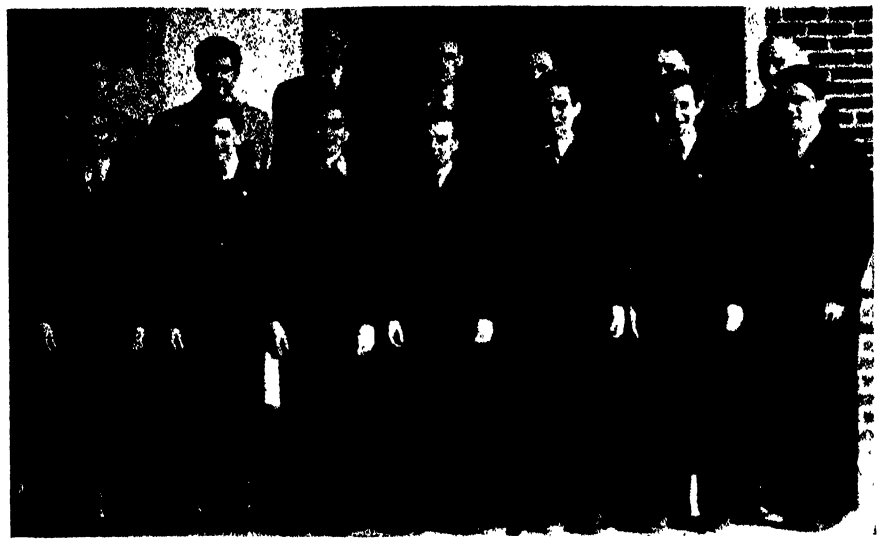
Randolph T. Major, director of research of Merck & Co., Inc., Rahway, N. J., has been appointed to the Graduate Council of Princeton University.

J. W. McCutcheon is serving as technical officer in the Explosives Division of the British Purchasing Commission, Washington, D. C.

Personnel changes in the Solvent and Chlorine Products Divisions of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., include the transfer of **Edward W. McGovern** from the Chlorine Products Division to be manager of the Solvents Division, of **Nelson C. Cooper** from the Solvents Division to the Chlorine Products Division, and of **M. Marean,** formerly manager of the Solvents Division, to be assistant to the director of sales.

Noah J. Menard, member of the executive staff of the Rumford Chemical Works, Rumford, R. I., has passed the examinations and been admitted to practice before the bar of the District of Columbia.

Lewis B. Miller has joined the consulting staff of W. H. & L. D. Betz, Philadelphia, Penna.



Major Albert J. Mottern, Chemical Warfare Service, formerly chief chemist of the U. S. Internal Revenue Laboratory at Philadelphia, has been transferred from Edgewood Arsenal, Md., to the Dugway Proving Ground, Clover, Utah, where he will serve as operations officer. Major Mottern served for nearly a year as commanding officer of the First Chemical Laboratory Company, the Army's first mobile chemical laboratory.

Kenneth W. Nelson has been on active duty as an ensign in the U. S. Naval Reserve since February 27, and at present is taking a special navy course in industrial hygiene at the Harvard University School of Public Health, Cambridge, Mass.

At the annual board of directors' meeting **Charles J. O'Connor** was elected to the presidency of Reichhold Chemicals, Inc., succeeding **H. Reichhold,** who becomes chairman of the board and general manager of the company's plants. **C. A. Knauss** has been elected as vice president in charge of eastern defense service.

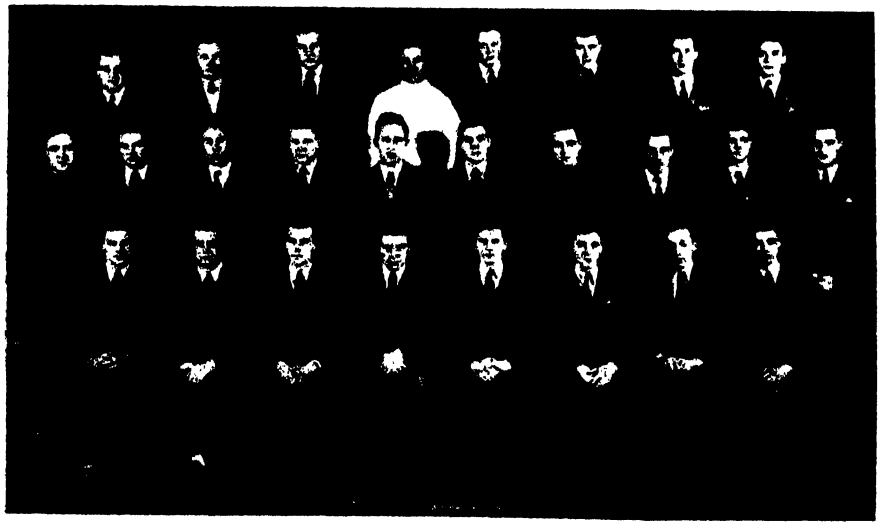
Elsa Orent-Keiles, formerly of the Biochemistry Department, School of Hygiene and Public Health, Johns Hopkins University, is now in charge of the Nutrition Research Laboratories and assistant chief of the Foods and Nutrition Division of the Bureau of Home Economics, U. S. Department of Agriculture, Beltsville Research Center, Beltsville, Md.

Ruth L. Payne has joined the staff of the Connecticut Telephone & Electric Corp., Meriden, Conn., as chemist.

Jamestown College A. C. S. Student Affiliate Chapter in front of the new Science Hall

She is to organize a chemical and general testing laboratory, develop methods for controlling plant processes, and work on pertinent research problems.

R. G. Phelps, formerly vice president of Meenan Oil Co., Inc., New York, will serve as price executive of the Chemical Section of OPA. Mr. Phelps, a chemical engineer who built explosive plants in the first World War, was previously associate price executive and succeeds **Clarence W. Farrier** who becomes technical director of the National Housing Agency.



David J. Price, chemical engineer of the Bureau of Agricultural Chemistry and Engineering, Washington, D. C., has been elected president of the National Fire Protection Association.

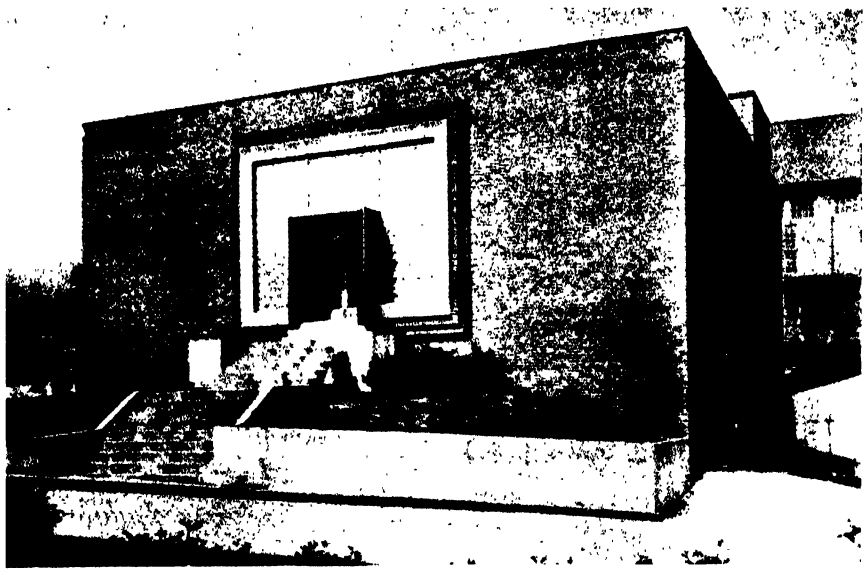
Hillary Robinette, of the Commercial Solvents Research Department, has been called for active duty with the Chemical Warfare Service, U. S. Army.

Adolph G. Rosengarten, Jr., has resigned as director of Merck & Co., Inc., Rahway, N. J., because of duties with the Army and is succeeded by his uncle, **J. G. Rosengarten, Jr.**

David B. Sabine has been appointed plant superintendent and general manager of the Arlington Chemical Co., Yonkers, N. Y. Mr. Sabine has been with the company 17 years and has been chief chemist since 1936.

Harold H. Zeiss has resigned his position with the research staff of the Sunbeam Electric Mfg. Co., Evansville, Ind., and is now employed as research chemist in the Ridbo Laboratories, Inc., Paterson, N. J.

A. C. S. Student Affiliates at St. Norbert College, West DePere, Wis.



Kober Medal Awarded to Van Slyke

THE George M. Kober Medal, one of the highest honors in the medical profession, was awarded on May 6 to Donald D. Van Slyke, Rockefeller Institute for Medical Research, New York, N. Y., by the Association of American Physicians. Dr. Van Slyke was cited for his contributions to the treatment of diabetes and Bright's disease, and his work toward oxygen treatment of pneumonia.

Evans Chemetics Increases Staff

RALPH L. EVANS ASSOCIATES, the research division of Evans Chemetics, Inc., has added six chemists to its staff: **Walter W. Edman,** from the M. W. Kellogg Co.; **Evelyn Klibaner,** from the General Dyestuff Corp.; **Fred Linsker,** University of Vienna; **Mildred Mellor,** formerly with the Cheney Bros. Silk Co.; **Carl Seybold,** formerly with the Trojan Powder Co.; and **John Ross,** recently with the Ponds Extract Co.

Chemical Laboratory of Vanadium Corp.

New chemical laboratory building of Vanadium Corp. of America

THE new chemical laboratory building at the Bridgeville, Penna., plant of Vanadium Corp. of America combines a high degree of visibility and noise-proofing with a ventilating control of atmospheric dust and gases, to which the tasks performed in an alloy laboratory are extremely sensitive. The laboratory was designed and built under direct supervision of O. M. Svensson, chief engineer for Vanadium Corp., by The Rust Engineering Co., Pittsburgh, Penna.

Air and temperature control of the laboratory rooms is facilitated by sealed walls of glass brick and glazed tile, acoustical-panel ceilings, and unusually large insulating air spaces in the walls and roof.

A perpetual positive pressure is maintained within the building, 8 per cent more air being delivered by the heating system into the rooms than is drawn off by the hoods. This produces a flow of air outward from the analytical rooms, through doorways, stairshafts, and the storeroom and basement windows, preventing entry of dust or gases from without. Of the large amount of air which the hoods must handle to evacuate gases, 75 per cent is supplied by forced air introduced around the upper periphery of the hoods.

The hood design incorporates a double roof and double side aprons, within which adjustable baffles control both the discharge from the hood and the characteristics of the air curtain around the sides. Exhaust piping is held to a minimum to reduce maintenance due to corrosive gases and resistance in removing heavy gases. The heating system is located in the basement, while all other air-handling equipment is housed in a penthouse.

The emphasis on atmospheric control arises from the sensitivity to contamination during difficult alloy analyses—for example, the determination of gases in steels and other alloys.

Another item specifically designed for alloy-laboratory use is the chemical drains of cast iron pipe, which are mounted exposed under the basement ceiling where they are easily accessible for repairs. These drains join the sanitary sewers in a manhole outside the building, eliminating numerous troublesome traps.

The building is fireproof, the only exposed combustible being the wood bead securing the acoustical ceiling panels.

W. M. Lehmkuhl has been appointed plant manager of the New Orleans plant of The Flintkote Co.

A. P. I. and S. A. E. Organize Research Council

THE Cooperative Research Council, a new organization sponsored jointly by the Society of Automotive Engineers and the American Petroleum Institute, has been created to centralize, correlate, and promote cooperative research activities of the automotive, aeronautic, and petroleum industries. The council formally began operation from its new headquarters in Room 1618, 30 Rockefeller Plaza, New York on May 1.

B. B. Bachman, Autocar Co., has been elected chairman, and T. G. Delbridge, Atlantic Refining Co., vice chairman. C. B. Veal, for 16 years S. A. E. research manager and secretary of the Cooperative Fuel Research Committee, is secretary of the council, and R. P. Anderson, secretary of the General Committee, Division of Refining of the A. P. I., is treasurer. The 12 council members, appointed to serve one year, are Mr. Bachman, Mr. Delbridge, J. M. Crawford, William Littlewood, J. B. Macauley, Jr., Arthur Nutt, C. G. A. Rosen, D. P. Barnard, A. L. Clayden, R. A. Halloran, K. G. Mackenzie, and G. G. Oberfell.

Summer Graduate Courses at New York University

THE Department of Chemistry, New York University, announces that a limited program of graduate studies will be offered at the Washington Square center during the coming summer. Courses in qualitative organic analysis and organic synthesis will be conducted and also research leading to the master's and doctor's degree. Information circular may be obtained on application from the graduate school secretary.

One of the large rooms in the Vanadium chemical laboratory

NECROLOGY

Mendel Donchi

MENDEL DONCHI, retired consulting chemist, died April 25 in Newark, N. J., at the age of 69. Dr. Donchi was born in Russia, received his doctorate in chemistry at the University of Berlin, and then went to Puerto Rico, where he grew and processed sugar cane as the representative of a German concern. He later became chief chemist and general manager of Central Aguirre, largest sugar enterprise of Puerto Rico. In 1917 he went to New York and became consulting chemist for several concerns. In the same year he made a survey of sugar cane possibilities in Palestine. He retired several years ago.

Carl O. Johns

CARL O. JOHNS, consulting chemist and former director of research and member of the board of directors of the Standard Oil Development Co., died April 17.

Dr. Johns, who was 71 years old, was born in Sweden and came to this country with his parents as a 9 year old. He enrolled at Upsala College, Brooklyn, in 1894. He received an A.B. degree from Bethany College, Kansas, in 1899 and took an A.M. there in 1902. He received a Ph.B. from Yale in 1904 and a Ph.D. from the same university in 1906. In 1922 Dr. Johns returned to Bethany for a doctor of science degree.

In 1899 he was named an instructor in natural history at Bethany and served that college as professor and treasurer. In 1904 as assistant in chemistry he went to Yale where he served as instructor and assistant professor until 1914. Dr. Johns was an organic chemist with the Bureau of Chemistry, U. S. Department of Agriculture, and later had charge of the Protein Investigation Laboratory, a post he held through 1920. He served on the Joint Commission on Reclassification of Government Salaries in 1919-20 and was chairman of the Intersectional Petroleum Symposium, New York, in 1924. He returned to Yale as a lecturer in chemistry in 1920 and also became associated with the Development Department of the Standard Oil Co. of New Jersey. He was director of research in that department through 1927 and a director and member of the board and executive committee of the company through 1930. Since 1930 he had been a consulting chemist.

Dr. Johns, a member of the AMERICAN CHEMICAL SOCIETY since 1907, had served as Councilor. He was a director of the New Jersey Chemical Society, former chairman of the A. C. S. Washington Section, and had headed the Yale Chemical Society since 1930. He also belonged to the American Association for the Advancement of Science, Society of Chemical Industry, Society of Biological Chemists, American Petroleum Institute, and Sigma Xi. Dr. Johns was the author of 80 scientific articles.

Karl Pomeroy McElroy

KARL POMEROY MCELROY, a long-time resident of Washington, D. C., died at his home, 1412 Sixteenth Street, N. W., the morning of April 18.

Mr. McElroy was born in Sidney, Ohio, 75 years ago and graduated from Columbia University, Washington, D. C. (now George Washington University). He served with the *Toledo Blade*, of which his father, Colonel John McElroy, was editor. Afterwards he became a prospector in the West and later served as a consulting chemist and metallurgist. He was appointed to a position in the U. S. Department of Agriculture and served directly under the late Harvey W. Wiley.

His skill as a chemist led him to join the Patent Office force in the United States Patent Office, where he served as an assistant examiner for a number of years. In 1905 he resigned and opened an office as chemical consultant and patent attorney. His ability along these lines brought him many clients, and he himself was an inventor of a number of important chemical products including diethylene glycol.

Mr. McElroy was a man of exceptional ability, and it is not too much to say that his advice and experience influenced a number of chemical industries. At one time Mr. McElroy was nonresident vice president of The Chemists' Club, New York. His affability and good humor, as well as his knowledge bordering on genius, helped to make him many friends, who share with his immediate associates in their loss.

Mr. McElroy is survived by his wife, Moree Buckles McElroy, of Washington, D. C.; a sister, Mrs. Elsie McElroy Slater of El Paso, Tex., and a nephew, John McElroy Slater of Washington, D. C.

Jean Perrin

JEAN PERRIN, Nobel Prize winner in 1926, and former president of the French Academy of Science, died in New York April 17 at the age of 71. Dr. Perrin became professor of sciences at the University of Paris in 1910 and served on the faculty for many years, but retired before the war. After the German invasion he came to this country and had been very active in the affairs of the Free French movement, becoming dean of the faculty of sciences of the recently established Franco-Belgian Free School of Higher Studies. He was also guest scholar at Wilson College, as occupant of the chair created by faculty members through a fund for distinguished foreign scholars.

Dr. Perrin's chief fame was won through research in the field of nuclear movements. He received the Nobel Prize in Physics in 1926 for work on the Brownian movement, and was also honored for work on the role of radiation in chemical reactions. In 1938 he informed the French Academy of Science, of which he was president, that there existed a 93rd element, "transuranium", heavier than uranium, previously believed the heaviest atom. He was founder of the Department of Physico-Chemistry at the Sorbonne and was the author of many scientific publications.

Gustave Whyte Thompson

GUSTAVE WHYTE THOMPSON, for many years chief chemist of the National Lead Co., died April 22 in Brooklyn, N. Y. He was 76 years old. Until his retirement four years ago, Dr. Thompson had direct charge of the company's laboratories, and its research laboratory was organized entirely under his guidance.

Dr. Thompson was born in Brooklyn in 1865. He joined the National Lead Co. as chief chemist when it was organized in 1892. During the World War he directed the establishment in the United States of a smelting plant to produce pig tin from South American ore. Dr. Thompson became a director of the company in 1916, and before his retirement had served as an officer or director of the Williams-Harvey

Corp., Titanium Pigment Co., United Lead Co., and Metallurgical and Chemical Corp. He was also a director of the Patino Mines and Enterprises, Inc., a Bolivian firm.

Technical processes with which his name is associated are the Thompson method for the analysis of white metal alloys, the Thompson laboratory classifier dealing with classification of particles according to fineness, the Harris process, and the commercial separation of elements in white metal alloys in the secondary metal field.

Dr. Thompson had been a member of the AMERICAN CHEMICAL SOCIETY since 1901, and was a former president of the American Institute of Chemical Engineers. In 1909-11 he was in charge of extensive work developing reliable data and adequate specifications for linseed oil, and from 1910 to 1920 was secretary of a committee of the American Society for Testing Materials which dealt with preservative coatings for structural materials. He was also active on the Committee on Nomenclature and Definitions. He was vice president of the A. S. T. M. in 1926 and 1927, and president in 1928. Mr. Thompson also belonged to the American Association for the Advancement of Science and the Society of Chemical Industry. He received the degree of doctor of science from Armour Institute of Technology in 1927.

WE ANNOUNCE with regret the death of the following A. C. S. members:

Charles Blanc, consultant, New York, N. Y. Member since 1931.

George Everett Flanigan, assistant director of laboratory, Borden Co., Bainbridge, N. Y. Member since 1935.

Lawrence J. Henderson, Abbott & James Lawrence Professor of Chemistry, Harvard University, Cambridge, Mass. Member since 1922.

Arthur Michael, emeritus professor of chemistry, Harvard University, Cambridge, Mass. Member since 1914.

Charles W. Morse, chemist, Bull & Roberts, New York, N. Y. Member since 1924.

W. L. Shively, chemical engineer, Boston Consolidated Gas Co., Boston, Mass. Member since 1940.

Leonard C. Surprenant, research chemist, plastics division, Monsanto Chemical Co., Springfield, Mass. Member since 1940.

David Warmbrunn, plant chemist, Tin Processing Corp., Texas City, Tex. Member since 1941.

Edgar Whedbee, sanitary engineer, State Board of Health, Dallas, Tex. Member since 1928.

Renee V. E. Wiener, Tomkins Cove, N. Y. Member since 1920.

Victor Yngve, chemical engineer, National Carbon Co., Highland Park, N. J. Member since 1911.

Chicago Chemical Exposition Expands

THE 1942 National Chemical Exposition at the Stevens Hotel, Chicago, November 17 to 22, the second sponsored by the Chicago Section of the AMERICAN CHEMICAL SOCIETY, will be twice as large in floor area as the first show. More than 40,000 square feet have been made available. The National Industrial Chemical Conference will be held in conjunction with the exposition.

Victor Conquest, chairman of the show committee, points out that the first show and conference in December 1940 proved most effective for the wide and quick distribution of new products, machines, and methods, as well as new uses for standard products, machines, and instruments. Such a result from this exposition would be a vital contribution to the war effort.

Serving on the committee with Mr. Conquest are: A. Guillaudeu, Swift & Co.; W. M. Hinman, Frederick Post Co.; W. C. Johnson, University of Chicago; L. E. May, Sherwin-Williams Co.; R. C. Newton and H. E. Robinson of Swift & Co.

The 1942 exposition will be the second sponsored by the Chicago Section of the AMERICAN CHEMICAL SOCIETY. Mr. Conquest points out that the first show and conference held in December 1940 proved most effective for the wide and quick distribution of new products, new machines and new methods, as well as new uses for standard products and standard machines and instruments. He stresses the fact that the chemical industry in this country really had its birth during World War I and the current emergency will probably make America the leading industrial chemical nation of the two hemispheres.

The show will be twice as large in floor area as the first exposition. More than 40,000 square feet have been made available in the exposition hall and adjoining ballrooms at the Stevens Hotel for the exhibition. The Grand Ballroom, with adequate seating capacity, has been reserved for the conference programs.

The Advisory Committee, working closely with the sponsors, is composed of Bruce K. Brown, J. V. N. Dorr, Willard H. Dow, Gustav Egloff, Otto Eisenschiml, Harry N. Holmes, Harrison E. Howe, Ward V. Evans, William Lloyd Evans, S. D. Kirkpatrick, H. R. Kraybill, A. H. Mellinger, George W. Merck, Thomas Midgley, Jr., Carl S. Miner, Walter J. Murphy, Harry McCormack, Charles L. Parsons, H. I. Schlesinger, N. A. Shepard, C. R. Wagner, E. R. Weidlein, Frank C. Whitmore, and E. C. Williams.

Marcus W. Hinson is show manager, with headquarters at 110 North Franklin St., Chicago.

Crude Oil, Natural Gas Gain as Energy Sources

COAL remains the dominant source of energy in the United States but is rapidly losing ground to petroleum and natural gas, a report of the U. S. Bureau of Mines reveals. Total available fuel and power energy in 1940 almost equaled the amount available in 1929, the peak year. In terms of coal, fuel and power production of all fuels was 884,224,000 net tons in 1929, compared with 879,324,000 net tons in 1940.

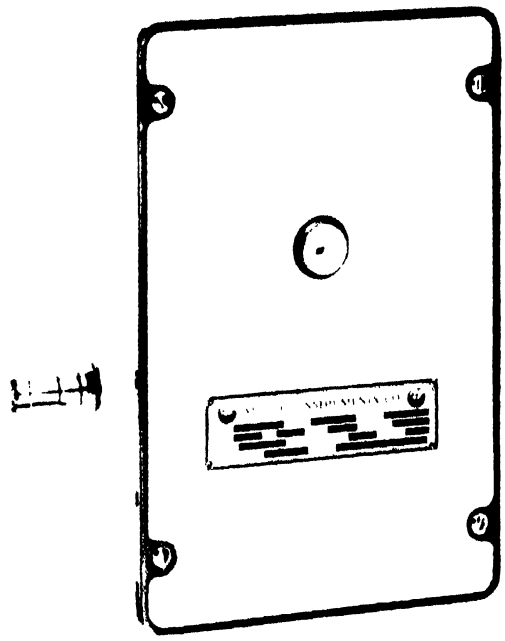
Coal accounted for 66 per cent of the total in 1929, only 54 per cent in 1940, while crude petroleum and natural gas energy rose from 31 per cent to 42 per cent of the total. Hydroelectric power increased from 3 to 4 per cent in the same period.

The bureau's report cautions that no attempt is made to equate these fuel and power sources on any basis except B. t. u. content and that for many uses they are not competitive. Less than one half of the output of petroleum and about one half of natural gas production are strictly competitive with coal.

Neil Kershaw, Chairman of the A. C. S. Indiana Section, has been called to active service with the War Department as sanitary engineer with headquarters at Atlanta, Ga.

Alan Kissock, vice president of the Climax Molybdenum Co., who has been in charge of its conversion plant at Langeloth, Penna., has resigned and been succeeded by **Arthur Linz.**

L. G. MacDowell, formerly employed as research chemist for the Carbide and Carbon Chemicals Corp., is now research director for the Florida Citrus Commission, Lakeland, Fla.



Edward V. Osberg has been named vice president of the Wilmington Chemical Corp., 10 East 40th St., New York, N. Y., and will be in charge of all sales and technical service. For five years he has been a member of the editorial staff of the *India Rubber World,* more recently as executive editor.

Walther H. Ott has completed his work for the Ph.D. degree in biological chemistry at the Pennsylvania State College and has joined the research staff of Merck and Co., Rahway, N. J.

Raymond Reuter is on leave of absence from the Atlantic Refining Co. to help in the war effort in the Office of Petroleum Coordinator, U. S. Department of the Interior, Washington, D. C., where he is working in the Equipment Procurement Section of the Refining Division.

CONTROL LIQUID LEVELS

without floats or contacts

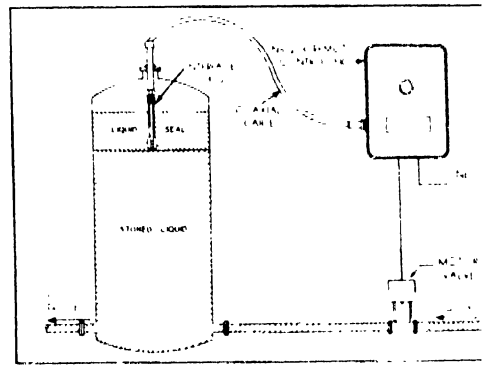
WHEELCO REMOTE CONTROLS

These *new* Remote Controls effect control action without any contact with the liquid to be controlled

They operate on a differential of .001 to .125 inches change in liquid level

They may be used with electrolytic liquids as well as dielectric liquids having dielectric constants as low as 1.8

They are capable of controlling the INTERFACE between 2 liquids—as described below

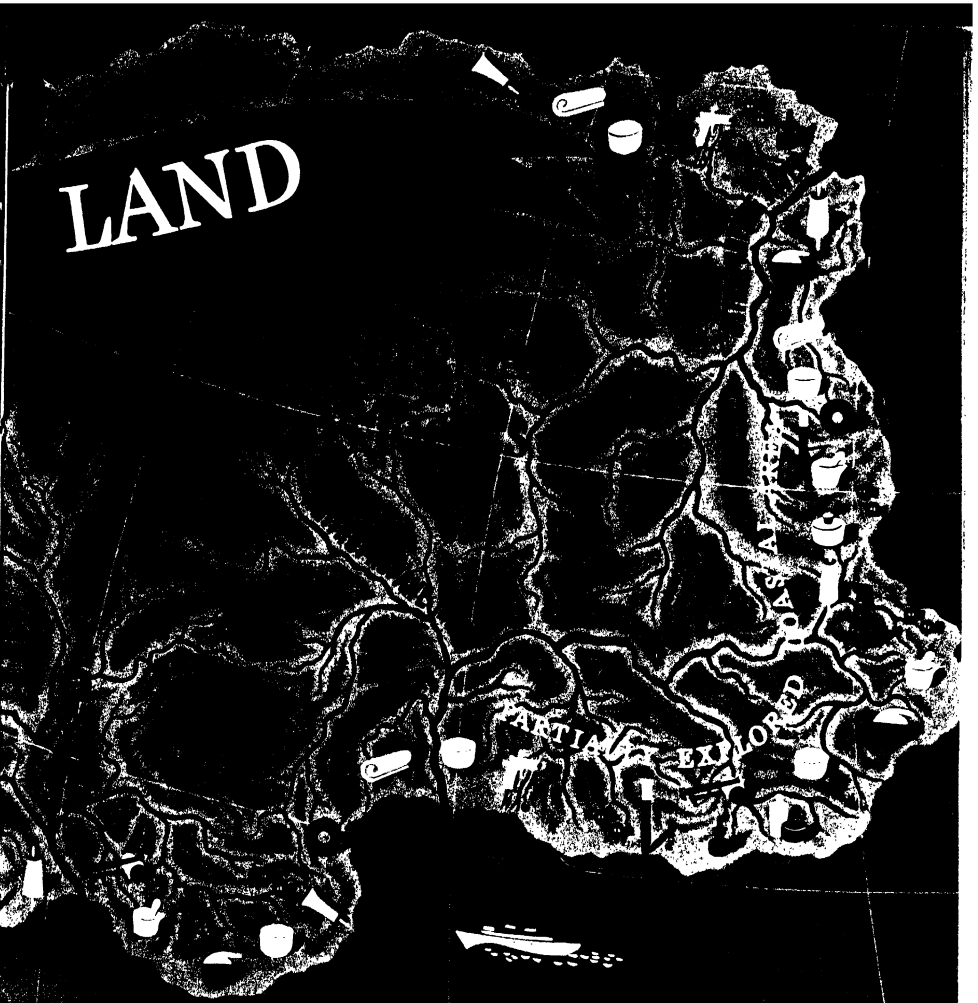


DESCRIPTION OF OPERATION

Remote Controllers employ Wheelco's famous "Radio Principle." A "Radio Principle" Control System consists, essentially, of an electronic tube and a relay assembly. The electronic tube is maintained in an oscillating condition and thereby generates a high frequency alternating current. This current is conducted to a Pick-up Unit by means of a special cable. Any material entering the field of the Pick-up detunes the oscillator. The resulting change in current through the relay operates its contacts.

REMOTE CONTROLLERS ARE AVAILABLE FOR A LARGE VARIETY OF APPLICATIONS

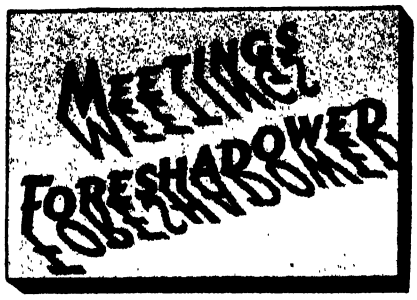
Wheelco Remote Controllers can be utilized for almost any application where control is essential. Various Pick-up Units, other than the one shown, are available for special control applications.



INTERFACE CONTROL—An Interface Pick-up Unit is placed in the vessel with the tip at the point where the interface is to be maintained. A movement of the interface between the two liquids—which, for example, may be an aqueous solution and an organic material—causes control action. The Model 263 Remote Controller energizes the throttling valve motor to open or close the valve, according to the position of the interface with respect to the Pick-up Unit. At an intermediate interface position it will permit the motor to stop, thus "floating" the valve in the correct position to maintain the level desired.

For Complete Data on Wheelco Remote Controllers Write for Free Bulletin No. J2.

NITROPARAFFIN LAND



This vast new chemical continent of the Nitroparaffins offers rich rewards in scientific and industrial achievement to research chemists who will develop its tremendous resources. For only the coastal areas have been explored, and they but partially. The fertile interior, made accessible by the main Nitroparaffin rivers and the thousands of derivatives that form their tributaries, is still virgin territory, awaiting the coming of the resolute chemical voyageur.

Write for 40-page data book—"The Nitroparaffins—New Worlds for Chemical Exploration."

INSTITUTE OF FOOD TECHNOLOGISTS. Hotel Nicollet, Minneapolis, Minn., June 15 to 17. Annual meeting.

SCIENTIFIC APPARATUS MAKERS OF AMERICA. Hotel Hershey, Hershey, Penna., June 1 to 3.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Columbia University, New York, June 27 and 28.

[1] The list of the SOCIETY's National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 601 of the May 10 issue.

Nineteenth Colloid Symposium

Boulder, Colo., June 18 to 20, 1942

PERSONS planning on attending the Boulder, Colo., Colloid Symposium, held under auspices of the Committee of Colloid Science of the National Research Council and the Colloid Symposium Committee of the Division of Colloid Chemistry of the AMERICAN CHEMICAL SOCIETY, will be interested in knowing of housing facilities in and near Boulder. Early reservations are advised since Colorado is a popular vacation center, although no one knows what to expect in the way of travel this summer. The University of Colorado summer session, usually enrolling over 4,000, promises to be large and numerous conventions are scheduled for Boulder during the summer months.

For room reservations, write to the respective hotels, mentioning that you are planning to attend the Colloid Symposium at the university.

Blanchard's Lodge is situated three and one-half miles up Boulder Canyon and has both rooms and cottages available at prices ranging from $1.25 single to $3.00 double.

Estes Park and Estes Park Village are 31 miles to the northwest of Boulder on a beautiful, paved, easy ascent mountain highway, and Denver is 32 miles southeast on a paved, plains highway. Good hotels are available at both places. The Boulder, Estes Park, or Denver Chambers of Commerce will be pleased to send descriptive literature, and lists of hotels and cottage camps on request.

For information regarding the symposium, address Frank E. E. Germann, Department of Chemistry, University of Colorado, Boulder, Colo.

Program

I. Apparatus and Techniques

June 18, 11:00 A. M.

1. FRANK E. E. GERMANN AND C. W. MCLANATHEN. A Method of Capillary Fluorescence Analysis Employing a Balanced Photoelectric Circuit.

2. HERMAN BENIAMS AND R. G. GUSTAVSON. The Theory and Applications of a Two-Path Rectangular Micro-Electrophoresis Cell.

3. LADISLAUS MARTON. Applications of the Electron Microscope in Colloid Chemistry.

II. Inorganic Colloid Chemistry

June 18, 2:00 P. M.

4. BYRON T. SHAW. The Nature of Colloidal Clay as Revealed by the Electron Microscope.

5. JOHN H. BLOMQUIST AND WESLEY G. FRANCE. Adsorption at Crystal-Solution Interfaces: An Electron Diffraction Study of Crystal Faces of Sodium Bromate with and without Adsorbed Dyes.

6. HARRY B. WEISER, W. O. MILLIGAN, AND W. C. SIMPSON. The Elimination of Sorption-Desorption Hysteresis.

7. L. H. REYERSON AND MARTIN CINES. Adsorption of Propane and Propylene by Silica Gel and Metallized Silica Gel.

8. T. H. JAMES. Influence of Age and Surface Conditions on the Reactivity of Certain Precipitates.

III. Colloidal Electrolytes

June 19, 9:30 A. M.

9. C. E. MARSHALL. The Clays as Colloidal Electrolytes.

10. E. L. MCBAIN. Migration Data in Solutions of a Colloidal Electrolyte, Lauryl Sulfonic Acid.

11. JAMES W. MCBAIN. Osmotic Properties of Solutions of Typical Colloidal Electrolytes.

12. HANS M. CASSEL. Surface Tension of Micelle-Forming Solutions.

IV. Protein Chemistry

13. E. A. HAUSER AND J. Y. KAO. The Mechanism of Rubber Latex Vulcanization at Low Temperatures.

June 19, 2:00 P. M.

14. G. E. BOYD AND W. D. HARKINS. Protein Films.

15. R. B. DEAN AND J. R. VINOGRAD. The Diffusion of Solubilized Dye in Water and through Membranes.

16. CHARLES H. NORRIS. Physical Properties of Living Matter.

17. ROBERT M. HILL AND VIRGINIA TREVORROW. Normal Variation in the Concentration of Fibrinogen, Albumin, and Globulin in Blood Plasma.

June 20, 9:30 A. M.

18. H. A. ABRAMSON, D. H. MOORE, AND H. H. GETTNER. A General Electrophoretic Pattern in Extracts of Pollens Causing Hay Fever.

19. HAROLD H. STRAIN. Problems in Chromatography and in Colloid Chemistry Illustrated by Leaf Pigments.

	Without Bath		With Bath	
	Single	Double	Single	Double
Boulderado Hotel	$1.25	$1.50	$2.50	$3.50–$4.50
Albany Hotel	$1.00–$2.00	$2.00–$3.00	$1.50–$2.00	$3.00
Monticello	$1.00	$1.50	$1.50	$2.50

New England Chemistry Teachers to Meet

THE Fourth Summer Conference of the New England Association of Chemistry Teachers will meet at the University of New Hampshire, Durham, N. H., August 11 to 14.

Durham is on the Western Division, *via* Dover, of the Boston and Maine Railroad. Frequent service is available all day. Reasonable taxi service is available from Dover for those trains which do not stop at Durham. The Durham railroad station is a two-minute walk from the registration desk of the dormitory. Bus service from Boston is also available. Telephone connections are available at James Hall (registration) and Congreve North (dormitory).

All teachers of chemistry in attendance at the conference are required to register. The charge for members, if paid before August 1, 1942, is $2.00; if paid after August 1, 1942, $3.00. Nonmembers will pay $5.00. At the option of the registrant, $3.00 of this fee may be used in payment of dues for membership for one year in the association. Nonprofessional guests of members or registrants will be charged $1.00 per family.

Rates for rooms, $1.00 per night, $3.00 for four nights. Meals will cost about $1.25 per day. The committee will attempt to make any special rooming arrangements that are desired, if it is notified in advance of the conference. All inquiries concerning the Fourth Summer Conference should be addressed to the conference chairman, Millard W. Bosworth, Saxtons River, Vt.

Program

Tuesday Evening, August 11

7:30—Motion picture program.
8:15—OFFICE OF THE PRESIDENT, University of New Hampshire. Welcome.
8:30—ARTHUR R. DAVIS. Fire and the Control of Fire.

Wednesday Morning, August 12

9:00—FRANK G. LANKFORD. Experimental Evidence on the Relative Value of Individual Laboratory Work and the Demonstration Methods in Teaching Science.
10:00—GORDON P. PERCIVAL. Modern Methods of Soil Testing.
11:00—CARLE R. HAYWARD. Chemistry and Physics Applied to Extracting Metals from Ores.

Wednesday Afternoon, August 12

2:00—[illegible] B. CLAPP. Sulfamic Acid and Its Uses.
3:00—JOHN E. CAVELTI, *Chairman*. Symposium—Atomic Structure.
4:00—Round Table Discussion. Laboratory or Demonstration.

Wednesday Evening, August 12

7:30—Motion picture program.
8:15—RALPH W. GERARD. Science Education and the Contemporary World.

Thursday Morning, August 13

9:00—CHARLES H. STONE. Guide Posts to Successful Teaching. Oxidation and Reduction.
10:00—ALBERT F. DAGGETT. Spectrochemical Analysis.
11:00—WILLIAM O. BROOKS. What the Chemical Warfare Service Is Doing.

Thursday Afternoon, August 13

2:00—FRANK SCHNEIDER. Microchemical Demonstrations as a Teaching Tool.
3:00—Symposium—Atomic Structure.
4:30—Round Table Discussions. I. The Fused Course. II. The Teaching of Elementary Organic Chemistry.

Thursday Evening, August 13

7:30—Motion picture program.
8:15—ROBLEY D. EVANS. Atom Smashing and the Structure of Atomic Nuclei.

Friday Morning, August 14

9:00—ERNEST G. RITZMAN. Calories in Wartime.
10:00—KATHARINE B. BLODGETT. Interference Colors Reflected by Thin Films.
11:00—C. HAWLEY CARTWRIGHT. Invisible Glass.

Friday Afternoon, August 14

2:00—JOSEPH J. SULLIVAN, S.J. Glass Blowing.
3:00—Symposium—Atomic Structure.
4:30—Round Table Discussion. The Effect of the War on Chemistry.

Friday Evening, August 14

7:30—Motion picture program.
8:15—ALEXANDER SILVERMAN. Glass Today and Tomorrow.

Chicago Spectroscopy Conference Scheduled

UNDER auspices of the Chemistry, Physics, and Astronomy Departments of the University of Chicago, a Spectroscopy Conference will be held at the University of Chicago, June 22 to June 25. The program comprises a series of more or less interconnected symposia, designed to promote the sharing of experience by workers in various pure science fields in which spectroscopy is important. Everyone is invited to attend, but because of probable space limitations should write at once to the conference chairman, Robert S. Mulliken, Ryerson Physical Laboratory, University of Chicago, Chicago, Ill., who will be glad to supply further information and a copy of the final program.

Registration and information headquarters for the first day will be in Eckhart Hall on the Quadrangles, University Avenue near 58th Street, beginning June 22 at 8:30 A. M. Headquarters hotel will be the Windermere East, 1642 East 56th St., near the 53rd Street station of the Illinois Central Railroad. This hotel offers special rates of $3.00 single, $5.00 double (twin beds), all rooms with private baths, to those attending the conference. Room reservations should be made in advance with the hotel direct.

The general conference committee consists of Professor Mulliken, O. Struve, J. Franck, and W. G. Brown.

Preliminary Program

Monday, June 22

9:30 A. M.

R. S. MULLIKEN. Introduction to the Conference.

SPECTROSCOPIC METHODS

H. G. GALE, *Chairman*

1. W. F. MEGGERS. Primary Standard of Wave Length.
2. W. E. WILLIAMS. Measurement of Standard Wave Lengths by the Reflection Echelon Method.
3. H. G. BEUTLER. Generalised Theory of the Concave Grating.

Monday, June 22

2:00 P. M.

THE SPECTRA OF COMETS

N. T. BOBROVNIKOFF, *Chairman*

1. A. MCKELLAR. Molecular Bands in Cometary Spectra: Intensity Measurements.
2. P. SWINGS. Molecular Bands in Cometary Spectra: Identifications.

Monday, June 22

8:00 P. M.

SPECTROSCOPIC APPLICATIONS OF ATOMIC BEAMS

R. A. Fisher, *Chairman*
K. W. Meissner
R. A. Fisher
J. Mack
W. E. Williams

Tuesday, June 23

9:30 A. M.

THE STRUCTURE OF THE EARTH'S ATMOSPHERE

O. R. Wulf, *Chairman*
1. F. L. Whipple. Meteors and the Earth's Upper Atmosphere.
2. C. T. Elvey. The Light of the Night Sky.
3. R. Wildt. Geochemistry of the Atmosphere in Relation to the Constitution of Terrestrial Planets.

Tuesday, June 23

2:00 P. M.

ATOMIC SPECTRA

G. S. Monk, *Chairman*
1. W. F. Meggers. Atomic Spectra of the Rare Earth Elements.

Tuesday, June 23

6:00 P. M.

Conference dinner.

Wednesday, June 24

9:30 A. M.

TRIATOMIC SPECTRA

H. H. Nielsen, *Chairman*
1. E. F. Barker. Infrared Spectra of Triatomic Molecules.
2. R. S. Mulliken. Electronic Structures and Spectra of AO_2 Molecules.
3. S. Mrozowski. Emission Spectrum of the Ion CO_2^+.

Wednesday, June 24

2:00 P. M.

ELECTRONIC SPECTRA OF ORGANIC MOLECULES

K. F. Herzfeld, *Chairman*
1. H. Sponer. Ultraviolet Spectra of Substituted Benzenes.
2. W. H. Rodebush. Interpretation of Ultraviolet Absorption Spectra in Terms of Resonance Structures.
3. A. L. Sklar. Theoretical Studies on Electronic Spectra.

Wednesday, June 24

8:00 P. M.

SPECTRA OF DYE MOLECULES

W. G. Brown, *Chairman*
1. W. G. Brown. Historical Introduction.
2. L. G. S. Brooker. Absorption and Structure-Degeneracy in Dyes.
3. A. L. Sklar. Quantum Theory of Dye Spectra.

Thursday, June 25

9:30 A. M.

ELECTRONIC SPECTRA OF ORGANIC MOLECULES

G. W. Wheland, *Chairman*
1. E. P. Carr and L. W. Pickett. Absorption Spectra of a Series of Dienes.
2. R. S. Mulliken and C. A. Rieke. Theoretical Studies on Electronic Spectra.
3. M. Goeppert-Mayer. Electronic Spectra of Wurster's Salts.

Thursday, June 25

2:00 P. M.

COOPERATIVE SPECTRA

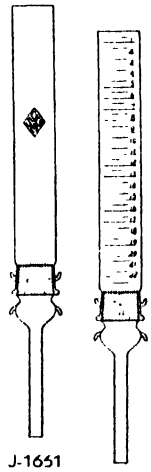
J. Franck, *Chairman*
1. S. E. Sheppard. Influence of Environment and Aggregation upon the Absorption Spectra of Dyes.
2. G. N. Lewis. Absorption and Emission of Light as a Function of Molecular Orientation.

Thursday, June 25

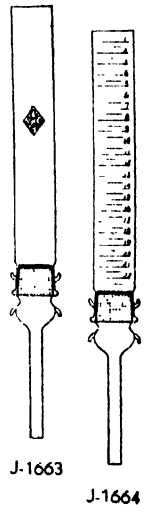
8:00 P. M.

SPECTRA OF ION COMPLEXES

P. Pringsheim, *Chairman*
1. E. Rabinowitch. Spectra of Ion Complexes.
2. S. Freed. Spectra of Rare Earth Complex Ions.



CHROMATOGRAPHIC APPARATUS



DESIGNED BY PROF. ZECHMEISTER AND DR. CHOLNOKY

"Chromatography," a new and extremely effective method invented by the Russian botanist Tswett, is for the separation and for the accumulation of natural products in extracts. The basic idea is that if a solution is sucked through a vertical column composed of a suitable adsorbent, the different solutes will be fixed in different sections of the column, according to their respective adsorption affinities. This separation becomes still more effective, if finally a pure solvent is sucked through the system. Each fraction so obtained can be used for any analytical or preparative operation, after having been eluted from the adsorbent by a suitable solvent.

Complete methods of analysis have been thoroughly described by Drs. Zechmeister and Cholnoky in "Principles and Practice of Chromatography" (New York: John Wiley & Sons, Inc.), 1941.

Four styles of tubes are available. J-1661 has a perforated plate sealed on the male connection, tube is not graduated; J-1662 has a perforated plate and column is graduated in 1/2 cm. divisions; J-1663 has a sealed in fritted disc, tube is not graduated; J-1664 has a fritted disc sealed in and column is graduated in 1/2 cm. divisions.

SIZES OF CHROMATOGRAPHIC TUBES

SIZE No.	Cylindrical Part MM. Diam.	Length	Connection
I	11	130	10/18
II	19	200	19/22
III	38	230	34/28
IV	48	270	45/35
V	58	300	55/35
VI	80	330	71/40

PRICES OF CHROMATOGRAPHIC TUBES

Size No.	J-1661 EACH	J-1662 EACH	J-1663 EACH	J-1664 EACH
I	2.50	3.50	3.50	4.50
II	3.25	4.25	4.25	5.25
III	4.00	5.00	5.00	6.00
IV	6.25	7.25	7.60	8.60
V	7.60	8.75	9.00	10.25
VI	12.00	13.50	14.00	15.50

SCIENTIFIC GLASS APPARATUS COMPANY

AMINCO EXPANDS AGAIN!

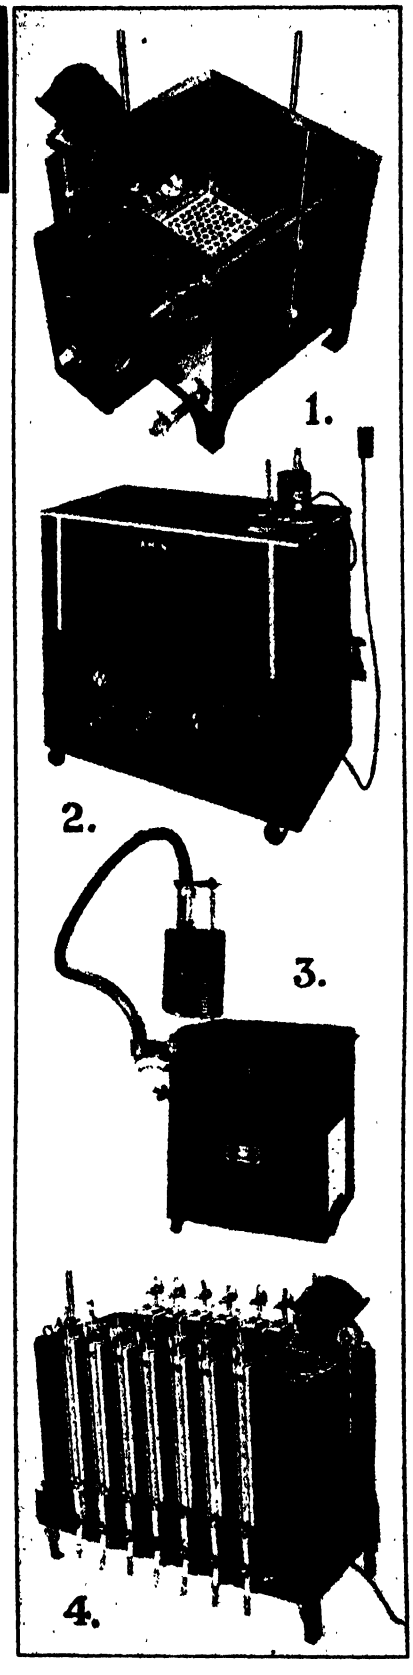
Rapidly Increasing Demand for Aminco Instruments Necessitates Still Further Plant Extensions

EVERY YEAR sees new Aminco plant facilities. The most recent additions to the main plant have more than doubled the company's facilities, thus enabling Aminco to ACCELERATE DELIVERIES and serve its customers more efficiently than ever before.

It will pay you to investigate NOW the improved service Aminco has to offer by virtue of its new plant designed and built specifically for the efficient production of scientific instruments.

Specialists in Constant Temperature Laboratory Equipment

THE TREND is decidedly to Aminco for all laboratory procedures involving the use of constant temperature equipment, which is attested by the ever-increasing patronage of the world's leading laboratories.



When you use Aminco constant temperature equipment you are not experimenting—you get equipment designed and built by specialists having long and intimate knowledge of the problems involved in constant temperature applications—and you get equipment embodying many features, improvements and refinements that make for extreme precision, dependability, and highly satisfactory performance.

Aminco constant temperature equipment will do for you what it has done for many others—step up the efficiency of your laboratory by making worth-while savings in time and money, and make possible improved laboratory methods.

The Aminco Constant Temperature Line Includes, in Both Standard and Custom Built Designs:

Baths Cabinets Ovens
Heaters Relays Thermoregulators Stirrers Pumps
Manometric Apparatus for Micro-respiration Studies

FULLY DESCRIBED IN CATALOG 41

Description of Illustrations

1. Constant Temperature Bath—One of numerous types of Aminco baths, with or without refrigeration, for maintaining temperature of the bath liquid constant to as close as ±0.005° C. if desired.

2. Refrigerated Constant Temperature Bath with Built-in Pump for Circulating Liquids Through Other Laboratory Apparatus—For maintaining the bath temperature constant to as close as ±1/4° F.

3. Portable Constant Temperature Bath-cooling Unit—For use in baths or tanks for maintaining the bath liquid at or below room temperature, with a constancy of ±0.1° or ±0.75° F.

4. Manometric Apparatus for Micro-respiration Studies—For studies according to the methods of Warburg, Barcroft and others. Range: 20° to 50° C. Constancy as close as ±0.005° C.

AMERICAN INSTRUMENT COMPANY

Scientific Instrument Makers for a Quarter Century

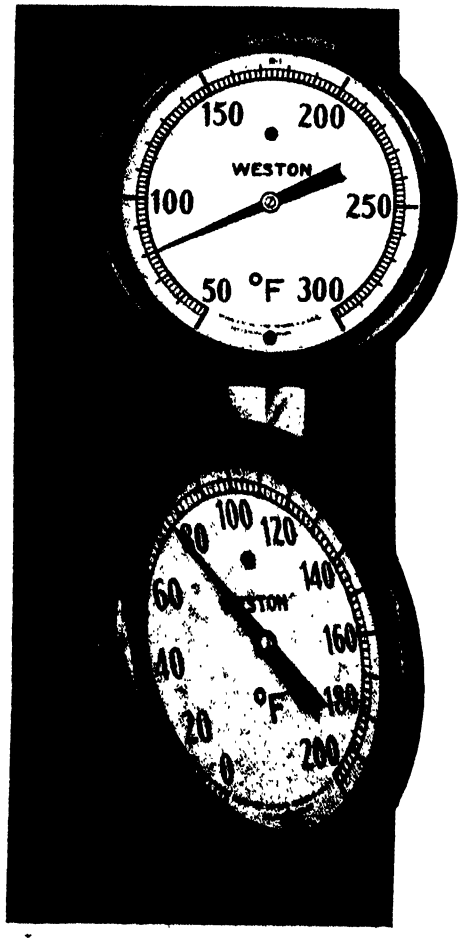
8010 - 8020 Georgia Avenue — In the Metropolitan Area of WASHINGTON, D. C. — Silver Spring, Maryland

American Electroplaters' Society

THE 30th national convention of the American Electroplaters' Society is to be held in Grand Rapids, Mich., June 8 to 10, 1942. The program will include a Victory Session on June 8, at which Wm. Blum, of the National Bureau of Standards, will discuss "Military Applications of Electroplating" and Wm. McCord, of the War Production Board, will speak on the "Present Situation in the Electroplating Industry Regarding Government Restrictions and Government Business". Technical sessions on plating, organic finishes, electroplating, and oxide coatings are included, as well as entertainment for the ladies, plant trips, and a photographic display.

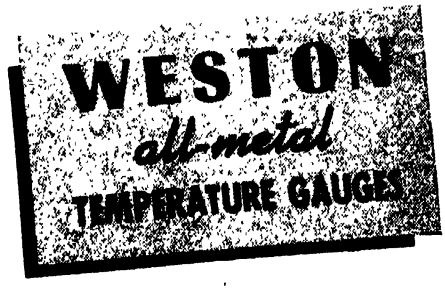
The general chairman of the convention is Chester W. Smith, 600 Prospect S. E., Grand Rapids, Mich.

The Chemists' Club Elects



AT THE annual meeting of The Chemists' Club (N. Y.) held on May 6, the following named officers were elected for the club year 1942–43: president, Walter S. Landis[1], American Cyanamid Co.; resident vice president, Ralph E. Dorland[1], Dow Chemical Co.; nonresident vice president, Jasper E. Crane, E. I. du Pont de Nemours & Co., Inc.; suburban vice president, William J. Orchard, Wallace & Tiernan Products, Inc.; secretary, Robert T. Baldwin[1]; treasurer, Ira Vandewater[1], R. W. Greeff & Co.; trustees, 3-year term, Charles L. Gabriel, Commercial Solvents Corp., James G. Detwiler, The Texas Co. Reports of officers and committees indicated the affairs of the club to be in excellent condition.

Announcement of the retirement of Emily J. Fell, after serving 24 years as the club's librarian, was received by members with regret.



Membership in the club now stands at 1,692 as compared with 1,539 on May 1, 1940, and 1,632 on the same date in 1941.

[1] Re-elected.

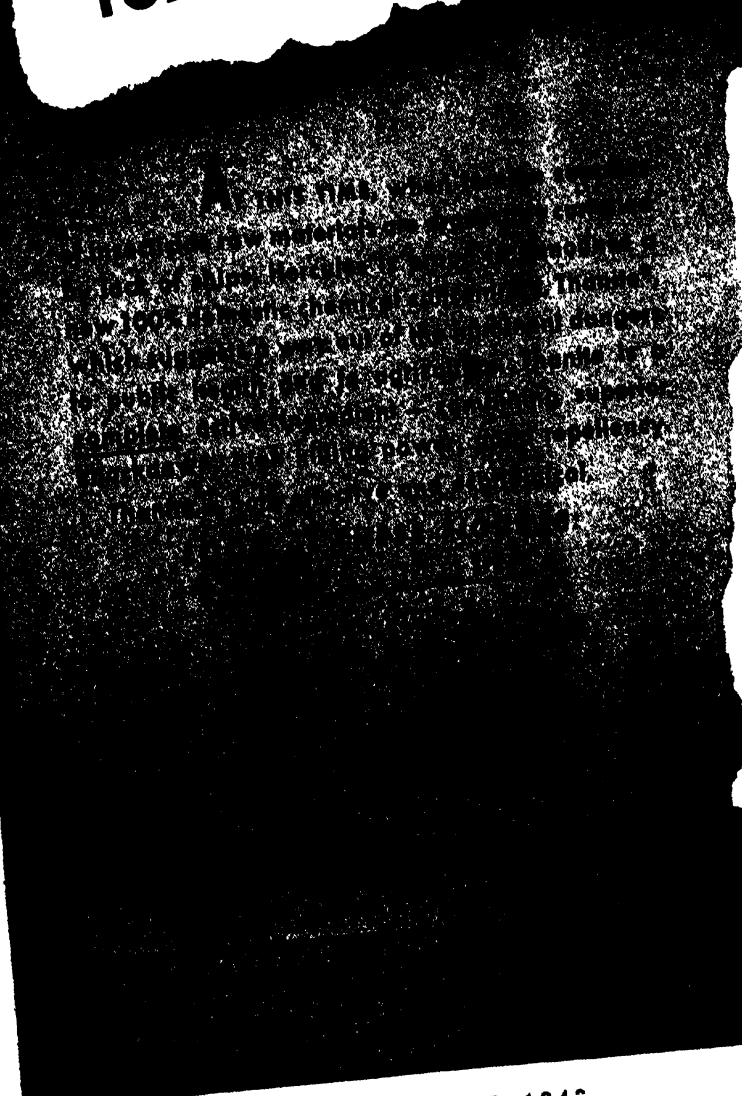
With no gases or liquids to leak . . . no gears or other fragile parts to wear or break . . . no capillary requiring corrections . . . the WESTON all-metal Thermometer *exactly* fits today's needs for temperature indication that is thoroughly dependable and virtually trouble-free. Made in types, sizes, ranges and stem lengths for most industrial applications. Accuracy guaranteed within 1% over the entire scale. Literature containing complete information is available. Weston Electrical Instrument Corp., 660 Frelinghuysen Ave., Newark, N. J.

Officers of Chicago Section

NEWLY elected officers of the Chicago Section of the AMERICAN CHEMICAL SOCIETY, who will assume office July 1, are: Roy C. Newton, chairman, Swift & Co.; L. M. Henderson, first vice chairman, Pure Oil Co.; T. H. Rogers, second vice chairman, Standard Oil Co. (Indiana); L. E. May, treasurer, Sherwin-Williams Co.; J. J. Doheny, secretary, Chicago Public Schools. Directors: M. H. Arveson, Malcolm Dole, W. V. Evans, W. F. Henderson, and A. W. Ralston.

Quebec Rubber & Plastics Group Meets

THE Quebec Rubber & Plastics Group held its final meeting of the season, May 8 at the Ritz Carleton Hotel, Montreal. After the dinner the annual meeting was held and the following officers were elected: chairman, Peter Gunter, Mack Moulding Co.; vice chairman, A. B. Lewis, British Rubber Co.; secretary-treasurer, R. V. V. Nicholls, McGill University; executive committee, J. T. Dunn, J. H. McCready, N. C. Smith, H. L. Blachford, L. C. McLeaod and W. P. B. Gedye.



The secretary-treasurer announced that next year the group will become The Rubber & Plastics Division of the Society of Chemical Industry. The Montreal branch extended the invitation to the Quebec Rubber & Plastics Group to affiliate with it and the parent English society has approved the necessary changes in constitution.

A.S.T.M. to Hold 45th Meeting

MORE than 100 technical papers and reports are scheduled for the 45th annual meeting of the American Society for Testing Materials at Haddon Hall, Atlantic City, June 22 to 26. There will be more than 150 meetings of technical committees. Featured will be the Symposium on Radiography and a Discussion on Solvent Action of Water Vapor at High Temperature and Pressure.

Announcing THANITE

A NEW 100% DOMESTIC TOXIC AGENT FOR FLY SPRAYS

QUICK FACTS

100% active, with a definite chemical composition, Thanite is produced under rigid chemical and biological control.

Thanite is safe, non-corrosive, non-staining, adds only a slight odor, as used in sprays.

Completely effective against a wide variety of insects, Thanite sprays combine high knockdown, kill, and repellency.

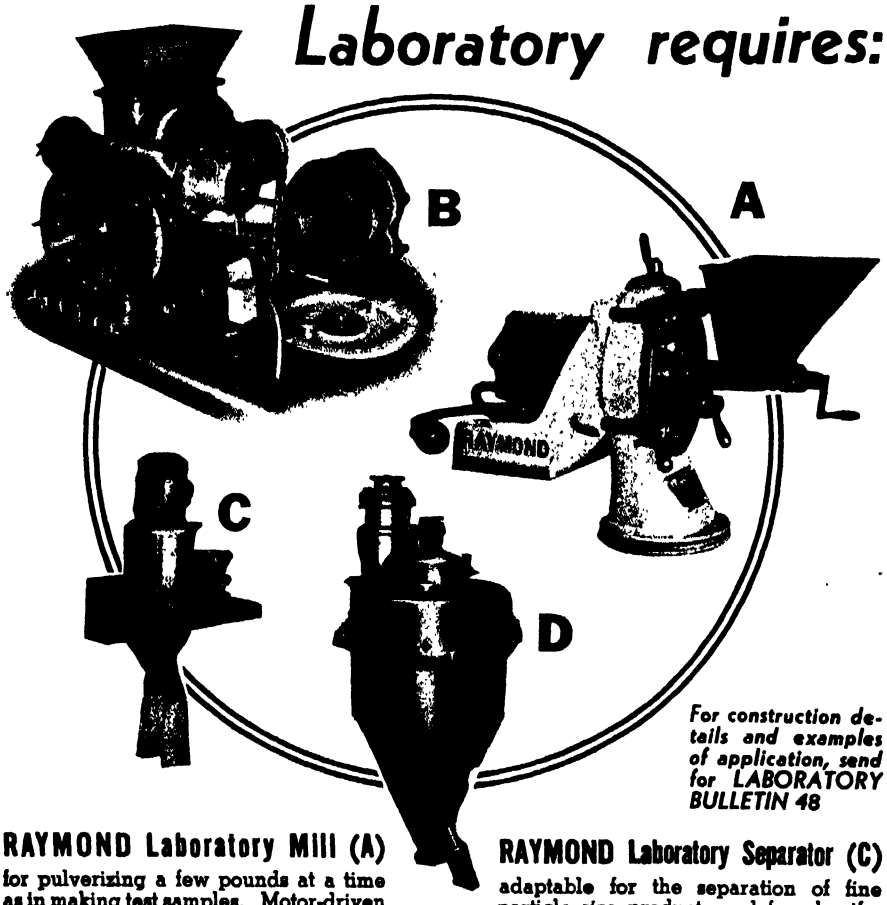
No container problem or manufacturing difficulties are encountered, since Thanite sprays are stable, even to light in flint glass bottles.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

PREPARATION of a program is an outstanding problem of most local sections. Finances, rather than inability to find suitable speakers, are the usual difficulty. This problem was solved by the Rochester Section when it was founded, 29 years ago. At that time it was agreed that local section dues of $2.00 a year would be charged to all, whether national members or local associates. Of course, local section meetings are open to national members, whether or not they pay local dues; but social functions can be arranged by the section, admission to which is limited to paid local members. The Rochester Section has never taken advantage of this excluding clause, but the officers have pointed out, when dues are payable, some of the advantages this section enjoys which are not enjoyed by members of other sections. The result is that a large percentage of the national members pay local dues.



The section also encourages interested persons in becoming associate members. These consist principally of people working in allied fields such as physicists, photographers, physicians, high school science teachers, and plant workers in chemical industry. A large number of young men who are not chemists but who are working under chemical supervision and studying chemistry in night schools or university extension courses also become associate members. Many of these eventually join the SOCIETY. The Rochester Section also encourages college and university students to join the local section, and to these a special rate of $1.00 a year is charged.

The Rochester Section holds 16 meetings a year, on the first and third Mondays of each month from October through May. At 12 of these, speakers from outside the section present papers. The remaining four are addressed by local chemists.

The first meeting in the fall is moved ahead to a previous Saturday, on the afternoon of which an outing is held in cooperation with the Syracuse and Cornell Sections. An annual golf game between the Rochester and Syracuse Sections is a feature of this outing. In the evening there is a dinner followed by the scheduled talk. Following one of the November meetings, cider and doughnuts are served by courtesy of the section; and the third Monday in April is always reserved as "Ladies' Nite" at which time an attempt is made to present a scientific program which will appeal especially to the ladies. Refreshments are served with the compliments of the section.

The plan outlined has proved successful at Rochester. Even at the bottom of the depression the section was able to add a few dollars to its reserve. With a little money in the bank officers can, with confidence, plan an ambitious, interesting, and valuable program for the succeeding year.—THOS. J. MURRAY, JR., *Rochester Section.*

What the well-equipped Laboratory requires:

For construction details and examples of application, send for LABORATORY BULLETIN 48

RAYMOND Laboratory Mill (A)
for pulverizing a few pounds at a time as in making test samples. Motor-driven rotor with swing hammers, hand-operated feeder, set of interchangeable screens for controlling fineness.

RAYMOND 12-Inch Screen Mill (B)
used in continuous grinding for laboratory and semi-commercial operations. Capacities ranging from 50 to 200 pounds per hour depending on kind of material, and the fineness of grind.

RAYMOND Laboratory Separator (C)
adaptable for the separation of fine particle size products and for classifying the mill grind of laboratory pulverizers. Set of whizzers and fans provided for controlling fineness.

RAYMOND 30-Inch Separator (D)
for laboratory use or for small commercial operations, as in classifying the mill grind from screen mills. Fineness control by means of damper slides adjustable from the outside.

Enemy-Owned Patents

ALIEN PROPERTY CUSTODIAN LEO CROWLEY has been authorized by the President to seize all patents which are enemy-owned or enemy-controlled and make them available for war production. He has already come into possession of a number of such patents, and expects to take over several thousand more in the next few months. Mr. Crowley stated to the Senate Patents Committee on April 27 that in general it was not intended that any should be sold at this time.

Scientists Face the World of 1942. Three essays by *Karl T. Compton, Vannevar Bush,* and *Robert W. Trullinger.* Followed by comments by *Harvey N. Davis, Detlev Bronk,* and *S. W. Fletcher,* respectively. Part III of a symposium at the 175th anniversary of Rutgers University. 80 pages. Rutgers University Press, New Brunswick, N. J. Price, $1.25.

PRESIDENT COMPTON'S essay is divided into two parts, one sketching skillfully the state of progress in the natural sciences up to the end of 1941, the other outlining and commenting on the organization of science for the prosecution of the war. As one would expect, the author's treatment is clear and concise, in fact the first part is too concise. Some detail of the second part could well have been omitted for a corresponding space expansion of the first part. President Davis' comments on President Compton's essay deliberately pass over the text and intentionally exploit some of the speaker's own preoccupations.

Dr. Bush deals with the need for and conditions precedent to the development of biological engineering as a distinct profession. Dr. Bronk in commenting does a commendable job of expanding Dr. Bush's thesis.

Mr. Trullinger deals similarly with the profession of agricultural engineer and does it entertainingly. Dr. Fletcher in commenting points out the shortcomings in existing curricular attempts to train for a profession of agricultural engineer, a discussion which is poignantly reminiscent of the birth pains of the chemical engineer three decades ago.

Just why these papers are put together in one book is not clear. All of them are general in their treatment as the necessary brevity of symposium papers requires. They are not, however, tied together by subject matter. President Compton had a chore to do and with his characteristic thoroughness and tender conscience did it well. Dr. Bush appears in a prophetic role and is convincing. Mr. Trullinger entertainingly records the efforts to bring all the science disciplines to the practical service of agriculture. But why all between two covers?

The printing is good, making it easy to read. Internal evidence indicates that President Davis' comments were printed from stenographic report of an extemporaneous speech and were not edited by the author. Similar evidence indicates that Dr. Bronk's comments were communicated in writing.

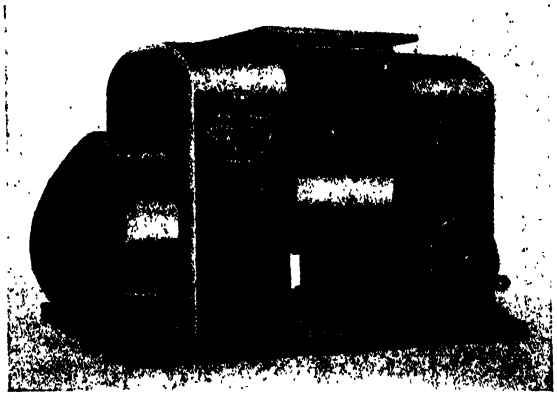
F. W. WILLARD

The Condensed Chemical Dictionary. *Thomas C. Gregory,* Editor. 3rd ed. 756 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y., 1942. Price, $12.

THE third edition of the Condensed Chemical Dictionary appears now some 12 years after its well-known predecessor. Extensive revision is one of the features of the new volume and a vast amount of new and additional information has been added. The general arrangement remains largely the same as that of the second edition, but in content it is vastly improved and far more valuable.

The dictionary is not intended as a universal compendium of information on chemistry. Rather, it confines itself to definitions of substances and descriptions of processes. Chemical specialties, sold under trade names, are included and in addition to information as to what the product is, typical specifications, color, odor, uses, containers, and shipping regulations are given. The data, supplied by the manufacturers, are to be considered typical of the commercial product.

As to chemicals, the dictionary becomes encyclopedic in many cases, giving synonyms, properties, constants, impurities, manufacturing procedures, literature references, grades, uses, and various other bits of information which the editor deemed important adjuncts to a definition.



Included also is an explanation of the rules of the Interstate Commerce Commission's regulations for the transportation of explosives and other dangerous articles, the report of the Nomenclature, Spelling,

THIS ... WAS OUR LAST HORIZON

When Balboa first sighted the Pacific, the glory and extent of his achievement must have eclipsed in his memory all thoughts of his arduous struggles through the fetid jungles. ¶ Though the scope of the Balboa type of exploration is now limited . . . today's physical and chemical research is not bounded by definite horizons. ¶ Daily, scientists are discovering new worlds . . . worlds that are as different, and seemingly as far away, as the Pacific was in the 16th Century. Worlds in which man can do things that he did not even dream . . . and worlds in which he can do old things in a quicker, better and more economical way. That is real progress. ¶ Achievement is the reward for years of patient and careful research, exhaustive and extensive tests, frequent failures and partial achievements. ¶ Sharples Engineers and Chemists regularly enjoy the desired rewards in successfully applying Super-Centrifugal Force to a new use or, in a new way. The horizon is still infinite.

THE SHARPLES CORPORATION

CONTINUED FROM PAGE 692

and Pronunciation Committee of the AMERICAN CHEMICAL SOCIETY on the pronunciation of chemical words, a study on the wartime effect on chemical prices, and a section of tables giving various physical and conversion data of interest in the chemical field.

The dictionary has a pleasing format and is easily read. Page size is approximately 6 × 9 and the paper is heavy enough to carry the print without showing through to the next page.

It is an important undertaking which should meet with continued success. We hope, however, to see the next edition before the passing of another 12 years.

Introduction to Chemical Thermodynamics. *Luke E. Steiner.* 1st ed. 516 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1941. Price, $4.00.

THIS book presents the fundamentals of thermodynamics and provides ample opportunity for the student to practice application on well-selected problems. The usual individual topics are considered, including chapters on partial molal quantities, nonideal solutions, galvanic cells, solutions of electrolytes, and some applications of thermodynamics. One chapter on general equilibrium conditions well might have been included in preceding chapters dealing with free energy and equilibrium.

A straightforward and rather complete mathematical treatment of thermodynamics is given. As the author states, derivations of formulas are given somewhat fully to free the class time for more important discussions. The nomenclature is that of Lewis and Randall; a complete table of symbols is provided.

Discussions of the various thermodynamic laws and functions are in general quite clear and understandable. It is felt, however, that some of the derivations could have been simplified. For example, the section dealing with the change in heat of reaction with temperature by Kirchhoff's law would have been improved by the more usual choice of system. Also, the second law development could have been more direct; it extends through two chapters and is likely to confuse the beginner.

The tables of thermal and other thermodynamic data are not adequate for problem work. Consequently, the problem statements at the end of each chapter contain the data, or reference is made to preceding problems; in some cases the student is referred to the literature for necessary information.

The book may be recommended as a text in elementary thermodynamics. The mathematical development is excellent and orderly; the student should appreciate properly the course if he has a background of the usual year of calculus. The book is well constructed, with large clear type, substantial binding, and a very complete index.

CHARLES D. LUKE

Diffusion in and through Solids. *Richard M. Barrer.* 1st ed. 464 pages + xiii. Cambridge University Press, England; The Macmillan Co., 60 Fifth Ave., New York, N. Y., 1941. Price, $6.50.

THE scholarly monograph by Dr. Barrer must be highly recommended, both for its theoretical interest and for its practical usefulness in a remarkable variety of applied fields.

The author first assembles for convenient reference mathematical solutions of the diffusion equation for many typical cases. Then he distinguishes types of flow, such as streamline, molecular, orifice, and activated diffusion, both specific and nonspecific, through lattices and along grain boundaries. The cases considered range from capillary tubes and miscellaneous porous systems to crystals, glasses, metals, and such organic solids as waxes, fats, rubbers, proteins, cellulose, resins, paint and varnish films, and textiles.

The text includes 119 tables of experimental data and 158 diagrams and graphs. In every case a theoretical analysis of the phenomena is given in so far as the data permit. Likewise, many applications are suggested for theoretical and practical purposes. Copious references are given in each chapter.

Barrer has a clear and interesting style which enables him to keep his subject matter in simple perspective while illustrating it with intriguing items of information. Workers in almost all fields of applied science will find materials and suggestions of value in this excellent monograph.

JAMES W. MCBAIN

Thermodynamics. *Joseph H. Keenan.* ix + 499 pages, 221 illustrations. 15 × 23 cm. John Wiley & Sons, Inc., New York, N. Y., 1941. Price, $4.50 cloth.

THIS new treatise on thermodynamics shows the continuing tendency for the chemist and the engineer to meet on common ground. At the outset the author maintains the traditional approach

Beyond the Flyleaf

CONTINUED FROM PAGE 694

through the Carnot cycle and draws his illustrative material from things and processes familiar to the mechanical engineer. Much attention is given to flow processes and to the various cycles of heat engines including internal combustion engines, steam turbines, and refrigeration. The treatment of the relations between pressure, volume, and temperature and on binary mixtures follows more the methods of the chemist than those of the mechanical engineer.

In the last few chapters the emphasis is on equilibrium. It presents that part of the work of Willard Gibbs which seems to bear most directly on problems in engineering. Moreover, it provides a broad and sound foundation for the discussion of equilibrium in the field of mechanics.

There are 26 chapters, 16 of which are evidently intended for undergraduate instruction. The last 10 chapters are indicated as being suited for graduate study. The notation is not far different from that of the chemist. A table of symbols, many problems, and a list of references are appended to each chapter. Most of the equations are developed in the differential form. Fugacity is briefly treated. The chemical potential is preferred over the molal free energy.

This is a scholarly and important contribution to the science and application of thermodynamics by an author who has had much experience in research and teaching in the field. The reviewer liked the work.

MERLE RANDALL

TechniData Handbook. *Edward Lupton Page.* 1st ed. 64 pages. The Norman W. Henley Publishing Co., 17–19 West 45th St., New York, N. Y., 1942. Price, spiral binding, $1.00; cloth binding, $1.50.

THIS is a small handbook which the author states in his preface was compiled when he was a student to enable him to find in one book the necessary data and formulas for his studies.

The book contains, in order, sections on mathematics, physics, chemistry, engineering mechanics, how to use a slide rule, and various tables giving properties of metals, standard pipe sizes, wire gages, and tap drill diameters.

The book is printed by a reproduction process and unfortunately some of the table headings, mathematical equations, and footnotes are practically illegible. This also holds for the lettering of the various figures. The section on chemistry is weak although probably suited to the needs of those not trained in chemistry. Eight pages are given over to most elementary chemical definitions. Its value as an addition to the library of chemical engineers and chemists is uncertain and this reviewer is not inclined to recommend it.

A Treatise on Physical Chemistry. A Co-operative Effort by a Group of Physical Chemists. In Five Volumes. Volume 1. Atomistics and Thermodynamics. 3rd ed. Edited by *Hugh S. Taylor, David B. Jones,* and *Samuel Glasstone.* vii + 679 pages. 15 × 23 cm. D. Van Nostrand Co., Inc., New York, N. Y. Price, $7.50.

THE appearance of this volume marks the renewal of the ambitious effort of 1924, the expansion of that most useful work to five volumes. It also brings Professor Glasstone to the assistance of Professor Taylor as co-editor. The first chapter, 119 pages, Atomic Concept of Matter by Professor Taylor himself, features a discussion of the mass spectrograph, radioactivity, isotopic research, the cyclotron, nuclear fission, and an elaborate table of induced radioactivity. Chapter II by Saul Dushman, assistant director of the General Electric Research Laboratory, 318 pages, Quantum Theory, brings Dushman's admirable previous treatment up to date. Chapter III, 74 pages, The First and Second Laws of Thermodynamics by Professor Taylor uses the notation of Lewis and Randall's "Thermodynamics". In addition to a summary of the important thermodynamic equations this chapter contains an excellent treatment of statistics and the partition function. The fourth chapter, 160 pages, by John G. Aston of Pennsylvania State College, The Third Law of Thermodynamics and Statistical Mechanics, is an excellent treatment including references to the latest work. Aston's notation is uniform with that of Taylor. Seventeen pages of important tables of functions are included. Finally, a table of Raymond T. Birge's 1941 "Values of Physical Constants" is included.

This treatise is a most welcome and timely addition to our American scientific literature. It should be on the shelves of every research library and on the desk of every serious worker in the fields of physics, chemistry, biology, or engineering. The mechanical appearance of the book is outstanding.

These 3 New Witco Developments

ARE RELIEVING RAW MATERIAL SHORTAGES IN MANY PLANTS

PERHAPS WE CAN HELP YOU TOO!

Witco Yellow, a replacement for French Ochre; Witco Blancal, an alternate for Blanc Fixe; Witcarb, an improved calcium carbonate—these three new products of Wishnick-Tumpeer research are not only relieving current raw material shortages in many applications, but are finding a permanent place in manufacturing techniques. For these products are not merely "substitutes" born of an emergency; they are definitely superior in many respects to the materials they replace.

These three developments offer convincing demonstrations of the skill and resourcefulness of Wishnick-Tumpeer's staff in dealing with raw material problems. The Research Laboratories of Wishnick-Tumpeer are thoroughly equipped to undertake such problems, particularly in the fields of chemicals, oil, pigments, asphalts, and allied products.

If you are faced with a shortage of raw materials essential to your production—or if new manufacturing conditions require modification in the properties of other materials—perhaps you, too, can benefit by Wishnick-Tumpeer's technical cooperation. Write, wire, or phone us an outline of your problem—what materials you need, what properties they must have, how they are to be used. Let our experienced research workers assist you in the effort to develop alternate or improved materials that may provide a satisfactory solution to your problem.

WITCO YELLOW

A new synthetic pigment, Witco Yellow offers interesting possibilities for replacing French Ochres in rubber and paint manufacture. While practically the same in analysis as French Ochre, it provides these outstanding advantages:

Greater strength
Higher tinctorial value
Cleaner final tint

WITCO BLANCAL

This precipitated barium-calcium compound is available in both low and high oil grades as an alternate to Blanc Fixe. In most cases, it gives better results than Blanc Fixe, since it offers you these desirable characteristics:

Extremely fine division
Excellent color, in dry state as well as under oil
Higher bulking value

WITCARB

This new inert offers special advantages as a white reinforcing filler in rubber formulas requiring high tensile and modulus. In paint formulas, it provides such features as:

Lower cost per pigment pound
More gallons per pound
Added texture in flats
Better stability in finished product
Improvements in Lithopone and Titanated Lithopone paints, and in some cases gloss paints and enamels

Samples and complete information on any of these new products will be sent on request.

tive text and large modernly arranged photographs in a recently published brochure. One of the many points mentioned is the personnel-training program inaugurated in 1933. The institute employs selected high school graduates and assists them in obtaining college degrees while gaining practical training. Three of the young men who joined the Merck Institute in 1933 and 1934 after graduation from high school are now engaged in research toward their doctorates. The institute expects that a substantial part of the research staff in years to come will consist of men who grew up with the organization in this way.

Tenth Anniversary of U. S. I. Chemical News

U. S. I. Chemical News, a news type of advertisement used by U. S. Industrial Chemicals, Inc., New York, N. Y., celebrates its tenth birthday in May. As one sheet, printed on both sides of a blue stock, the insert has appeared regularly since 1932 in publications reaching the chemical, paint, varnish and lacquer, textile, artificial leather, explosives, and other fields. Its policy has been to stress informative news rather than attempt direct selling. Until two years ago it was known as *Solvent News*.

Since 1933 a companion advertisement, *U. S. I. Alcohol News*, has also been published, in publications going to the drug, cosmetic, and pharmaceutical fields.

Oil-Reservoir Behavior

A NEW method of evaluating the producing capacities of oil wells by comparing the amount of recovered petroleum with the decline of pressure in the reservoir has been suggested by U. S. Bureau of Mines engineers. Detailed descriptions of the fields studied together with tables, charts, and other pertinent information are included in R. I. 3634, "Oil Reservoir Behavior Based on Pressure-Production Data", by H. C. Miller. Copies may be obtained without charge by writing the Bureau of Mines, Department of the Interior, South Building, Washington, D. C.

1942 Cooperative General Chemistry Test

THE Committee on Examination and Tests of the A. C. S. Division of Chemical Education adds to its recent announcement that the editors of the 1942 Cooperative General Chemistry Test are Theodore Ashford, University of Chicago; Alexander Calandra, Brooklyn College; F. D. Martin, Purdue University; B. C. Hendricks, University of Nebraska; and W. J. E. Crissy, Cooperative Test Service.

The committee also reports that the Cooperative Organic Chemistry Test, Form S, has been made available through the efforts of Ed. F. Degering, Purdue University, with collaboration of a large group of other teachers. Information concerning these examinations may be obtained from the Cooperative Test Service, 15 Amsterdam Ave., New York, N. Y.

EMANATIONS

WITH red face CHEMICAL AND ENGINEERING NEWS bows to a gentle but deserved drubbing from Austin M. Patterson:

I note in the March 10 issue, page 346, that a condensate return system made by Cochrane Corp. assures "complete elimination of entrailed air". To be used in the vicinity of packing plants, I presume.

FROM a civilian defense examination for prospective air raid wardens we learn:

An incendiary bomb consists of a 2½-pound hollow filled with termites.

The RECOVERY of VAPORS

with SPECIAL REFERENCE to VOLATILE SOLVENTS

By CLARK SHOVE ROBINSON

Department of Chemical Engineering
Massachusetts Institute of Technology

MODERN LIBRARY OF CHEMICAL ENGINEERING SERIES

RECENT years have seen greatly increased interest in the problem of recovering solvent vapors from various industrial processes, such as the recovery of gasoline from natural gas, of alcohol vapor from the gases liberated in the fermentation of sugars, of carbon disulfide in viscose rayon production, and the removal of water vapor from air. This reclamation of valuable materials is especially important under war conditions, and a study of its possibilities by plant executives and engineers in all solvent-using industries will be well repaid.

The aim of this book is to state briefly and clearly the engineering principles involved and to describe the most successful methods and equipment now in use. The laws governing gases, vaporization, condensation and adsorption are discussed, with copious diagrams and many typical calculations. This feature makes the book extremely useful to students of chemical engineering as well as to engineers whose chief activities lie in other fields. Diagrams and designs of equipment, both old and new, accompany the text, together with numerous photographs of recent installations. Complete vaporization data of gases is included in the appendix.

The only book describing this phase of the process industries, it will be welcomed by all who need to understand the principles and applications of vapor recovery.

CONTENTS: Introduction. Gases and Vapors. Vaporization. Liquid Mixtures. Distillation of Liquid Mixtures. Condensation of Mixed Vapors. Rate and Capacity. Adsorption. Adsorption of Mixed Gases. Rate of Adsorption. Recovery of Adsorbed Vapors. Adsorption Apparatus for Solvent Recovery. Commercial Activated Carbon Systems. Solvent Recovery by Condensation at Constant Pressure. Condensation with Cooling Water. Cooling with Refrigeration. Heat of Vaporization in the Absence of Gases. Vaporization in the Presence of Inert Gases. The Gas under Natural Circulation. The Gas under Forced Circulation. Apparatus Used in Forced Circulation of Gases. Solvent Recovery by Compression and Cooling. Solvent Recovery by Scrubbing. Scrubbing Apparatus. Special Absorbents. Extraction by Solvents. Appendix. Indexes.

CHARLOTTE NORTH CAROLINA

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

732 FEDERAL STREET CHICAGO, ILLINOIS

Specify Florite Desiccant

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

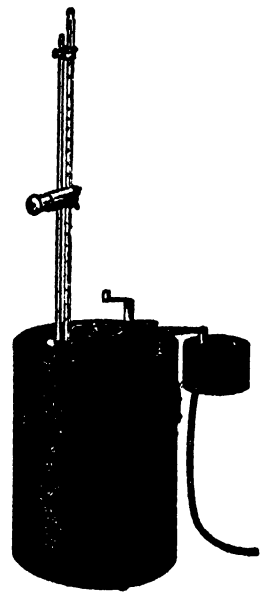
Specify KARCITE MOLDED CERAMIC SINKS



Free from distortion — inert to solvents — and mineral acids (except hydrofluoric.) Will not crack or break under ordinary weight shocks and thermal shocks. Gray black color — smooth-surfaced — dull gloss finish. Lighter — stronger — easier to clean. Write for Catalog.

Karcite Sink No. S-600

PARR INSTRUMENTS

PARR OXYGEN BOMB CALORIMETER

For determining the heat of combustion of any solid or liquid material that can be completely burned in an oxygen combustion bomb, including coals, petroleum products, foodstuffs, organic compounds and numerous other carbonaceous materials. This apparatus is available with either the single valve manually sealed bomb or the double valve self sealing bomb. The jacket is of the constant temperature type, utilizing a dead air space to obtain its high insulating efficiency. Accuracy is well within the permissible tolerance specified for standard calorific tests.

Write for new bulletin E-63; or get your copy from any authorized dealer in Parr Apparatus.

PARR INSTRUMENT COMPANY · Moline, Ill.

POLYMERIZATION, ISOMERIZATION, ALKYLATION, HYDROGENATION, DEHYDROGENATION, DEHYDRATION, SULPHURIZATION, NITRATION, CHLORINATION, FLUORINATION AND OXIDATION

Try Harshaw chemicals in your process. Many of the materials listed have been produced in Harshaw's plants for many years, others have been added to meet the ever increasing requirements of industry. Production and control facilities are geared to war time needs, with ample space for further expansion.

Harshaw can supply you with chemicals for experimental work, pilot plant and large scale production — a pound or a carload.

RESEARCH'S CONTRIBUTION TO THE WAR EFFORT

62 of a series of timely suggestions for solving war-time problems

You may find the answer to your problems in the following list:

ADV.

Protect aluminum with new chemical against corrosion at low temperatures where condensation is possible. (111)

Metal castings, smooth and non-brittle, are now produced by a new foundry core application. (115)

Seal for joints and seams which is flexible, leak-proof, non-cracking and resistant to benzol, gasoline, diesel oil, butane, propane, pentane and similar liquids and gases. (119)

Lubricating compound for drawing aluminum. (139)

Lubricating compound for tin stamping which permits the stamping of lacquered metal without fracturing the coating. (140)

Rust prevention, lubrication and bright annealing of nickel alloy stampings are obtained by the application of a solution of a synthetic wax which gives a water resistant finish. On subsequently annealing the stamping, the wax has a reducing action on the oxides and gives a very bright anneal. (157)

Both ferrous and non-ferrous surfaces can be protected from tarnish and corrosion by means of a special emulsion which is sprayed cold on to the desired parts to give a thin, transparent adhesive film. (159)

Nickel alloys are now being drawn, stamped or formed and then annealed without cleaning by means of a special water dispersible wax-like synthetic. (177)

Sintered bearings made with metallic powders have a tendency to stick in the molds. A newly developed lubricant enables the bearings to be very readily released from the molds. (179)

A water soluble material that gives a soft, flexible, transparent film on paper, textiles, wood, etc. (112)

Waterproof cloth or paper in one operation. A new waterproofing liquid does it. (133)

Flameproofing agent cuts fire risks for textiles, paper, wood and composition board. (143)

Paper coated with paraffin wax is rendered much more translucent by a pre-treatment with an aqueous solution of a new synthetic chemical. (145)

Non-stick wrapper for packaging sticky candies and other products made possible by new wax coating of white, odorless, synthetic wax in conjunction with paraffin wax. (156)

Olive Oil substitute for textile and other technical lubrication. (128)

Textile lubricant which is water soluble. (137)

Cotton and rayon braid, shoe laces, etc., are treated with a combination of waxes to give increased flexibility and high lustre. (148)

Dye Solvent for water insoluble dyes which makes them "soluble" in water. (149)

Textile emulsions of oils and waxes stable in the presence of sulphuric acid, aluminum sulfate and other electrolytes, can readily be made by use of a new type of emulsifying agent. (152)

"Nylon" and "Vinyon" lubricant can readily be made in the cold by use of synthetic emulsifying agent. The finished oil is readily removed by water, is non-oxidizing, stainless and will not carbonize. (167)

Textile oils used as worsted lubricants, spun rayon stock lubricants, finish and lustre oils for cotton, rayon and other natural and synthetic yarns can economically be made by means of a new synthetic oil, produced from domestic raw materials. (170)

A temporary binder for clays for ceramic insulation prior to firing, enabling the clays to be molded without crumbling. (113)

Porcelain, vitreous china, plated metal parts are protected against mechanical abuse and corrosion by a new type of protective coating. (123)

Binder for vitreous enamel to replace gum arabic for vitreous enamel designs, enabling identifications or trade-marks to be applied with a rubber stamp. (131)

Abrasive wheels. A temporary binder for abrasive wheels which completely volatilizes on firing. (141)

Porcelain enamel frit binder giving a firmer and more lustrous enamel coating than is obtained with gums. (142)

Adhesive for "cellophane", cellulose acetate and other synthetic materials of a similar nature. (118)

Adhesive for holding tissue paper to aluminum in special map and display work. (124)

The adhesion of rubber to cloth on vulcanization can be increased by the addition of a chemical material to the raw rubber mix. (151)

Thermosetting cements for lamp and radio tube bases of the alcoholic phenol formaldehyde type containing a synthetic product, made domestically, have greater thermoplastic effects before heat setting than when shellac is used. (164)

Pulp color and pigment dispersing agent for aqueous products that prevents caking. (120)

Flatting agent for paints and varnishes that eliminates grinding and produces a smooth, uniform product. (125)

Semi-gloss water emulsion paints and varnishes that are water resistant on drying are made with a protein base. (127)

Lacquer, varnish and enamel plasticizer which is light in color and which will increase the gloss of the dry film. Also has good wetting and dispersing properties for pigments. (144)

Lake colors which permit soft grinding, giving better length and dispersion, are obtained by the application of a glyceryl compound before coupling bases. (163)

Pigment lakes incorporated in the usual vehicles exhibit greater length and absence of "buttering" by the use of a special soaplike material applied in the acid phase in the manufacture of the lakes after coupling. (166)

Non-mar enamels are easily made by the incorporation of a solution of a special wax which gives increased "slip" effects. (169)

Lacquers giving excellent water and ink resistance are obtained by the incorporation of a solution of a new type of wax. (171)

Rubber goods finish of high lustre and flexibility resistant to gasoline. (129)

Raw rubber sheets can be prevented from sticking together by means of a water dispersion of a synthetic wax-like material. This dispersion can also be used as a lubricant in the cutting of rubber gaskets. (150)

Plastic and hard rubber articles can be polished by the tumbler barrel method by means of a hard, white, synthetic wax which effectively replaces carnauba wax at a much lower cost. (168)

Synthetic rubber can now be made flexible by means of a new plasticizer which is now available. (184)

Cork preservative to prevent mould formation. (132)

Cement, concrete and stucco waterproofing agent. (138)

Warpage of wood can be prevented by the use of a special wax which increases acid and alkali resistance as well as decreasing time of impregnation. (146)

Wood, fibreboard, etc., can be flameproofed effectively without loss of other properties. (176)

Sulphonated oils in the treatment of furs and leather can be replaced by the use of a new synthetic oil which eliminates rancidity and stickiness. (158)

Printing ink vehicles giving better spread, slip and anti-blocking effects are obtained by substituting for ozokerite a new synthetic wax made from domestic raw materials. (162)

Urea formaldehyde resins are plasticized and lubricated by new water dispersible waxes which are incorporated in the aqueous phase. (165)

Carnauba wax can be replaced as a lubricant for molding thermosetting plastics by a synthetic wax now available in powdered form. (172)

Wax which will not melt in boiling water. (110)

Substitutes for imported waxes such as Montan wax, Ozokerite, Japan wax, etc., now available. (114)

Synthetic oils dispersible in water that do not contain soap, or added emulsifiers. (121)

Emulsifying agent for emulsions stable to strong acids, salts and other electrolytes. (122)

Photographic offset plates are improved, giving increased water solubility, spread and wearability by the use of a new type of binder. (126)

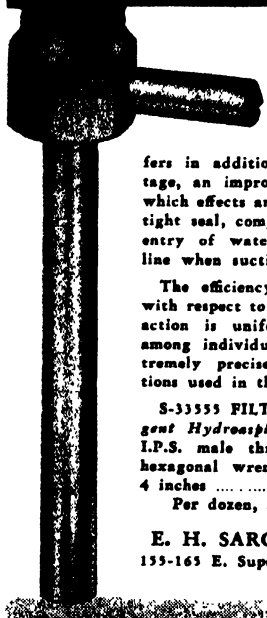
Defoaming agent for casein, glue, gelatine, shellac and similar products. (130)

Wax which "dissolves" in hot water. (135)

Oil which remains fluid at -50° C. without freezing. (136)

Glycerin substitutes meeting specific requirements are now commercially available. (175)

Lanolin for industrial purposes can be replaced by a new compound made from domestic raw materials. (178)



A liquid foam producer to replace Saponin for industrial purposes, is now being offered. (181)

A hygroscopic, water soluble liquid which is an excellent dye solvent and which replaces glycerin in many instances. (182)

See number in parenthesis after each subject. Jot down and mail to us any number that interests you. We will send you data sheets about the chemicals and their uses. Answers to many other problems in your industry are given in our 112 page manual "Chemicals by Glyco"—which is yours for the asking.

GLYCO PRODUCTS CO., INC.
230 King St., Dept. 48, Brooklyn, N. Y.

SARGENT
HYDROASPIRATOR
IMPROVED

Already rated as one of the fastest filter pumps available, the Sargent Hydroaspirator now offers in addition to this advantage, an improved valve system which effects an *immediate* water tight seal, completely preventing entry of water to the suction line when suction is stopped.

The efficiency of these pumps with respect to speed and sealing action is uniformly maintained among individual pumps by extremely precise machine operations used in their production.

S-33555 FILTER PUMP — *Sargent Hydroaspirator.* With ⅛" I.P.S. male thread at top and hexagonal wrench seat. Length, 4 inches ..... each $1.25
Per dozen, 20% discount

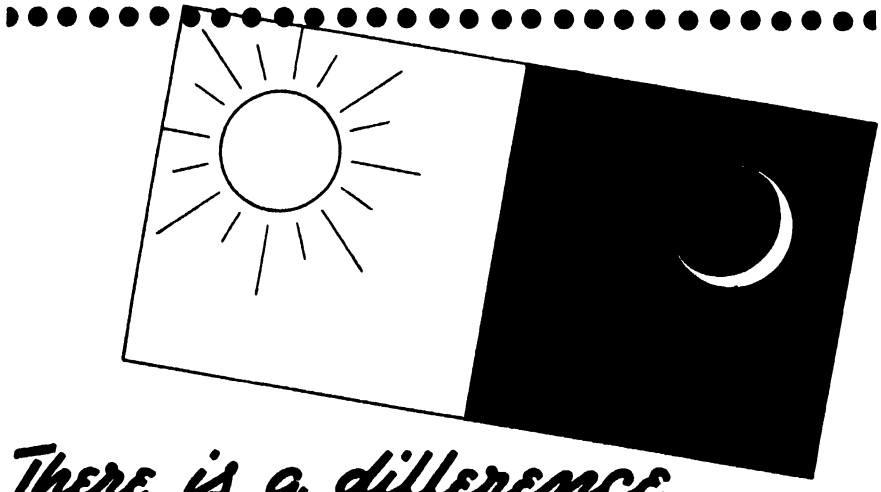
Sulfur Stocks in U. S. A.

THE American sulfur industry finds itself well able to cooperate with industrial users of sulfur who recently were advised by the War Production Board to build up stocks of sulfur at their plants so that possible future transportation tie-ups would not halt their operations. All sulfur production and shipment records were broken in 1941 and stocks at the mines decreased about 7 per cent. The sulfur industry, however, during the first three months of this year, was able to exceed by about 8 per cent the 1941 rate of production and increase by about 20 per cent the rate established during the first quarter of 1941. As a result, stocks of sulfur at the mines on March 31 of this year were slightly in excess of the stocks at the end of 1941, in spite of the present accelerated demand and shipments. Producers of sulfur, therefore, have available ample stocks from which consumers may build up their reserves during the summer and so relieve the strain on the railroads during the fall and winter.



Wood Trusses Instead of Steel

ON THE new storage depot program alone, we expect to employ around 35,000 wood trusses, thereby releasing more than 200,000 tons of steel. That much steel, it is estimated, will build 7,500 medium tanks," said Raymond F. Fowler, Chief, Supply Division, Corps of Engineers, in discussing conservation of materials at a symposium sponsored by the Producers' Council.

United States army engineers have demonstrated during the last few months that it is possible to build, yet not use critical materials. They use wood extensively in construction of hangars, ports cantonments, munitions factories, dams, and many other structures for war purposes.

Colombia Plans Conversion of Bones to Fertilizer Material

THE Colombian Congress at the end of 1941 laid out an extensive program of chemical development for the country in the coming year. Provisions enacted include establishment of a fertilizer plant and setting up of soil conservation and soil analysis services. Chemists have not found satisfactory mineral deposits for the proposed fertilizer plant, however, and it is now planned to establish one or two plants to convert animal bones into the product. Pilot plants already are operating at Bogotá and Medellin with an estimated production of 20 metric tons possible from the 1,000 head of cattle slaughtered daily in the entire country. Imports by Colombia amounted to 13,120 metric tons of fertilizer between 1936 and 1940.

There is a difference in Active Carbons

AND THERE'S A GRADE OF NUCHAR FOR EVERY PURPOSE

No one quality of active carbon will suffice to meet the varied needs of industry. That's why we manufacture over 30 different grades of NUCHAR Active Carbon.

Considerable care should be given to the selection of a suitable active carbon for each purpose as carbons vary widely in specific action. Frequently the application of active carbon has been discarded because sufficient study was not given to the selection of the proper quality. Although some special high-priced active carbon may be essential to certain applications, yet this same active carbon may be no better pound for pound than a less expensive active carbon for certain other applications. Our technical staff will be glad to determine the proper grade of NUCHAR Active Carbon you should use to get maximum purification and minimum operating cost.

NUCHAR INDUSTRIAL CHEMICAL SALES

Laucks Test Dust Explosibility

ALTHOUGH fire protection associations have warned against the explosiveness of dust, life and property in the United States continue to be lost, oftentimes by lack of simple precautions. Nearly all finely divided organic or metallic substances are likely to explode when mixed with air and ignited—whether by spontaneous combustion, generation or application of flame, spark or excessive heat, or flint stones, nails, or bits of metal striking sparks.

In Laucks Laboratories, Inc., Seattle, Wash., an apparatus has been built according to specifications of the U. S. Bureau of Mines, Washington, D. C., to determine the explosibility of various dusts, so that preventive measures may be intelligently carried out in any plant. The apparatus consists of an explosion chamber of heavy glass that has a light cover to afford a vent for the explosive gases. Suspended in this chamber is a nichrome or a platinum filament. The filament is heated almost to its melting point by electricity to ignite the dust. The dust is weighed, placed in a small filter funnel, and thrown into the combustion chamber by a sudden gust of oxygen or air emanating from a pressure bottle sealed with mercury. If the dust is explosive, a small explosion results. If no explosion occurs, further tests are sometimes carried out with higher and higher concentrations of oxygen until even such substances as diamond dust can be exploded. Materials requiring extremely high oxygen concentration to be explosive are, of course, not considered hazardous. Such dusts can contribute to the severity of explosions caused by other dusts, however.

Indiana Standard Systematizes Scrap Campaign

ONE cruiser, 450 tanks, 13,000 cannons, 536,500 machine guns, or 5,500,000 rifles could be made from the 15,000 tons of steel and iron scrap which Standard Oil Co. of Indiana has set as the goal for the "Get in the Scrap" campaign at its six refineries in 1942. More than 2,000 tons of steel and iron scrap have already been saved by the Whiting, Ind., refinery alone in the first three months of this year.

Much old refinery equipment is being dismantled that would not normally be torn down until other times, the company declared. The scrap is sorted and plate, pipe, fittings, valves, etc., which are usable are set aside and reclaimed for reuse in the refineries. The Whiting refinery has also saved much other material in the first three months of this year, such as 90 tons of lead and 25 tons of baled paper.

Dust Elimination

THE Schneible Filtre Fan is a collector unit to remove dust and fly ash from flues, kilns and furnaces, smelter stacks, and cupolas. It consists of a combination housing on which are mounted a rejector wheel and fan wheel, on a single motor-driven shaft. Solids are removed from the gas stream by means of this rejector wheel which throws the particles into a dead zone and hopper by centrifugal force. The dust particles do not come into contact with the wheel, thus eliminating wear on wheel blades. It is made by the Claude B. Schneible Co., Chicago, Ill.

Mineral Wool Board Insulation

A MINERAL wool board type of insulation for cold storage rooms and equipment has been introduced by the Building Materials Division, Armstrong Cork Co., Lancaster, Penna. It is a nonpriority material and is available for all kinds of installations. Developed and proved in more than 200 installations within the past six months, the mineral wool board equals or exceeds Federal Specification HHM-371 for board or block form insulation, having a thermal conductivity as determined by tests of average material produced ranging from 0.31 to 0.33 at 90° F. The material has good moisture resistance, is self-supporting, and will stay permanently in place without sagging, settling, shrinking, swelling, or warping.

Manufactured in board size of 12 × 36 inches and in thicknesses of 1, 1½, 2, 3, and 4 inches, Armstrong's mineral wool board is applied essentially the same as corkboard. Erection in hot asphalt with multiple layer construction is recommended. The material may be finished with asphalt plastic or portland cement plaster.

High-Speed Steel

THE Jessop Steel Co., 534 Green St., Washington, Penna., announces a low tungsten-molybdenum steel, TCM high-speed steel.

The steel is heat-treated in the same furnaces and the same atmosphere as 18-4-1 high-speed steel. It has a slightly lower hardening temperature which contributes to a lower cost in heat treating and is lighter in weight than 18-4-1.

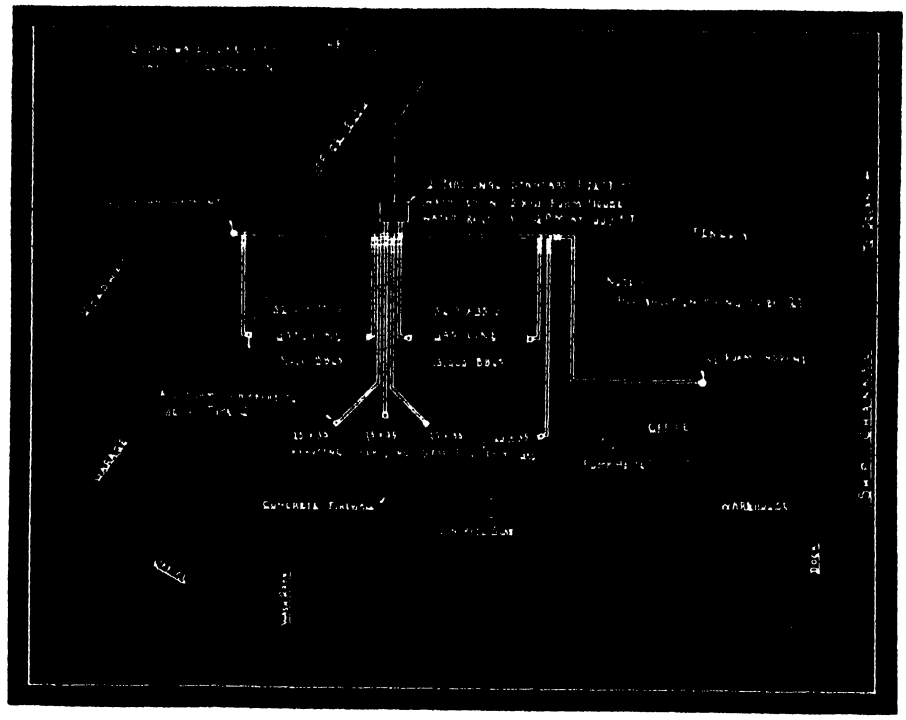
Pinch VALVES
for Abrasive or Corrosive Pulps and Liquids

Made with rubber or synthetics, the Masseo-Grigsby Pinch Valve is more resistant to wear than metal valves. Shuts tight even on solid particles... withstands freezing. Useful for solutions which are highly corrosive or which crystallize at normal temperatures and must be handled hot; for solutions or solids which are both corrosive and abrasive. Sizes from 1" to 12". *When writing please state your problem.*

The MINE AND SMELTER SUPPLY CO., Denver, Colo.

Prizes Doubled in Compressed Air Idea Contest

INCREASED war production, by broadcasting new and unique industrial uses for compressed air, is the goal of Blast the Axis Program conducted under Compressed Air Institute sponsorship. Opened as a compressed air idea contest before Pearl Harbor, it was intended to speed defense. Recognizing the contest's value in meeting the new urgency, the institute has inaugurated two new steps. The value of each cash prize has been doubled, bringing the total to $1,000, and the duration of the program has been extended one month, to terminate July 1.



Nation wide in scope and open to virtually any one in industry, the contest is not restricted to employees of companies comprising the Compressed Air Institute. Skill in writing and grammatical construction will have little weight in awarding prizes. The idea and its value to industrial production is the important thing. Entries which have a bearing on some particular aspect of war production, whether or not the idea wins a prize, will be made available to appropriate federal authorities with full recognition to the contributor. Inquiries on the idea program should be addressed to the Educational Director's Office, East Orange, N. J.

Monsanto Opens Phosphate Plant

WITHOUT ceremony or slowing work Monsanto Chemical Co.'s Trenton, Mich., plant went into production recently. The new plant, situated on a 138-acre tract, will eventually turn out a group of industrial chemicals derived from phosphorus. Among products to be made are phosphoric acid, used for treating metal to replace tin plate in many uses, and sodium phosphates, used for cleaning metal parts and in boiler water conditioning, the textile industry, soap manufacture, and oil-well drilling. The principal raw material is pure elemental phosphorus manufactured at Monsanto's huge electric furnace plant in Monsanto, Tenn.

Synthetic Rubber Production

THE first synthetic rubber to be produced in any of the new synthetic rubber plants being erected for the Government's defense plant corps has been produced by the Firestone Tire and Rubber Co., Akron, Ohio, as a test run of several thousand pounds, according to announcement made May 14. Regular production is expected to get under way in a few days and will increase to plant capacity as raw materials become available. The first batch of synthetic rubber was used in making the latest combat tire for military vehicles.

These are National's recommendations for the protection of a large industrial plant. One man controls the entire system.

PLANS FOR A BULWARK AGAINST FIRE!

THIS plan is not for sale! It was designed for specific fire-hazards in a particular plant. And while you can't buy the plan, you *can* use the knowledge and experience responsible for its creation!

In other words, National engineers and laboratory men ask for the opportunity to study your fire-protection requirements . . . the type of fire that threatens your production . . . how and where it will go into action . . . and how you can launch a counter-attack with the least delay, least expense, and greatest efficiency!

Regardless of your hazard, National has achieved a fire-fighting record with it! We shall gladly make recommendations without obligation to you.

The Only Chemical Foam That Can Extinguish Polar Organic-Solvent Fires!

Alcohol, ether, ketones, esters and mixed polar solvents immediately break down ordinary foam bubbles. *Yet they can't touch National "99".* Every test has shown that! Listed by the Underwriters' and Factory Mutual Laboratories, National "99" is an exclusive National development!

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Band-Sawing Operations. This 48-page booklet describes 40 types of machining operations that can be performed with band saws. *40 Different Ways to Cut Machining Costs CEN.* CONTINENTAL MACHINES, INC., Minneapolis, Minn.

Care of Conveyor and Elevator Belting is covered in a 24-page catalog section. Included are instructions on preventing wear at loading points; making belts run straight; and wear due to defective idlers, excessive tension, or excessive exposure to light, heat, and moisture. Other subjects are the proper selection of new belts, installation, splicing, and various repairs. *Catalog Section 2,800 CEN.* B. F. GOODRICH CO., Akron, Ohio.

Centrifugal Pumps. Described in these two bulletins are two-stage volute centrifugal pumps available in capacity ranges of 30 to 650 gallons per minute, operating against heads of from 100 to 300 pounds per square inch. *Bulletins 228-1, 229-1 CEN.* WARREN STEAM PUMP CO., INC., Warren, Mass.

Dust Control. Why industrial control is necessary is discussed in a 2-page release. *Release 95-CEA.* AMERICAN FOUNDRY EQUIPMENT CO., Mishawaka, Ind.

Electrical Wiring Joints. This 4-page folder gives data on a device which joins the ends of electric lines by the simple operation of inserting the ends of the lines and twisting. These wire joints are small enough to be used in knock-out boxes and are said to be approved by the Underwriters' Laboratories. *Form WDB-342 CEN.* IDEAL COMMUTATOR DRESSER CO., 1279 Park Ave., Sycamore, Ill.

Horizontal Pumps. This 8-page bulletin describes high-pressure motor-driven horizontal pumps and two-plunger steam pumps. The motor driven pumps are available in pressure ranges from 380 to 12,000 pounds per square inch and displacements from 0.5 to 186 gallons per minute. The steam pumps range from 900 to 13,200 pounds per square inch and 1.25 to 45 gallons per minute displacement. *Bulletin 270-A CEN.* WATSON-STILLMAN CO., Roselle, N. J.

Liquid Handling Equipment. This 40-page catalog features the manufacturer's line of lubrication, filtration, metering, pumping, storage, and dispensing equipment. Used extensively in the solvents, lubricating oil, fuel oil, and gasoline fields, this equipment also finds application with many other liquids. *Industrial Equipment Catalog CEN.* S. F. BOWSER & CO., INC., Fort Wayne, Ind.

Load-Center Power Distribution System. An 8-page illustrated publication helps in the selection of the proper arrangement of load-center distribution system to fit individual requirements. *Bulletin GEA-3759-CEN.* GENERAL ELECTRIC CO., Schenectady, N. Y.

Machine Maintenance. A 16-page bulletin describes the metallizing process and equipment for its application. *Bulletin 42 A-CEN.* METALLIZING ENGINEERING CO., INC., 21-07 41st Ave., Long Island City, N. Y.

Machine Tool Accessories. A 4-page folder lists such items as live centers, electric etchers, balancing ways and other equipment for the machine shop. *Form MSB-142 CEN.* IDEAL COMMUTATOR DRESSER CO., 1277 Park Ave., Sycamore, Ill.

Manufacturer's Line of Equipment. This 11-page illustrated booklet contains a classified listing of all products made by this manufacturer. *How Worthington Serves Industry Booklet CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Micromax Speed Recorders. This 11-page illustrated bulletin tells about instruments which measure and automatically record speed of rotating machinery. *Catalog N-27 CEN.* LEEDS & NORTHRUP CO., 4934 Stenton Ave., Philadelphia, Penna.

News from Production Front. A 4-page leaflet tells how General Motors went at the war production job and what has been accomplished. *News Letter 1-CEN.* GENERAL MOTORS CORP., Detroit, Mich.

Oil-Burning Equipment. A 4-page folder describes equipment said to be capable of an unusually wide range of capacity. This is attained by a burner designed to provide efficient atomization throughout the capacity range and a control system which balances the mixture of air and fuel through this range. *Bulletin 107 CEN.* PEABODY ENGINEERING CORP., 580 Fifth Ave., New York, N. Y.

Overhead Cranes. A 28-page catalog describes overhead cranes of many types for a wide variety of services. *Bulletin H-13 CEN.* HARNISCHFEGER CORP., Milwaukee, Wis.

Petroleum Refining. This 80-page booklet is a treatise on refinery processing equipment. Each separate section, devoted to each process described, includes a discussion of the process, an illustration of a typical plant installation, and a flow sheet. Also given are a large number of illustrations of refining units, a general section on petroleum processing, and a table of physical constants. *Bulletin 0-42-1 CEN.* FOSTER WHEELER CORP., 165 Broadway, New York, N. Y.

Plating Conveyors. An illustrated bulletin gives detailed descriptions of the construction of the semiautomatic heavy-duty plating conveyor, describing the types of drives, methods of agitation, and operation. *Bulletin SA-101-CEN.* HANSON-VAN WINKLE-MUNNING CO., Matawan, N. J.

Pressure Instruments. A 24-page catalog covers pressure indicating, recording, and controlling instruments of the bourdon spring, bellows, and manometer type. *Catalog 76JF CEN.* TAYLOR INSTRUMENT CO., Rochester, N. Y.

Production Facilities. A new catalog presents a complete list of machines that comprise the company's facilities for fabrication of sheet metal, sheet steel, and light plate, with name and size of each piece of equipment. *Catalog CEN.* THE S. C. BAER CO., 500 Times-Star Tower, Cincinnati, Ohio.

Rheostats and Resistors. A new 16-page catalog lists over 1,000 stock items in rheostats, resistors, tap switches, chokes, and attenuators. It gives illustrations, descriptions, ratings, and prices. *Catalog 18-CEN.* OHMITE MANUFACTURING CO., Department 9B, 4835 Flournoy St., Chicago, Ill.

Rubber-Lined Barrels and Drums. This catalog leaflet describes barrels and drums lined with rubber by the Vulcalock process. These drums may be used for the shipment of certain dilute inorganic acids, salts, and alkalies, and certain organic chemicals such as formic acid, acetic acid, and formaldehyde. *Catalog Section 9,030 CEN.* B. F. GOODRICH CO., Akron, Ohio.

Sand Pumps. Described in this 4-page folder are centrifugal sand pumps which have no stuffing boxes. These pumps are suitable for the pumping of sands, sludges, slurries, slimes, and many abrasive solutions. *Bulletin E-1400 CEN.* A. R. WILFLEY AND SONS, INC., P. O. Box 2330, Denver, Colo.

Steel Stamps. A 16-page catalog gives information on a complete line of steel stamps, type holders, and accessory equipment. *Supplement A to Catalog 146 CEN.* JAS. H. MATTHEWS & CO., Pittsburgh, Penna.

Temperature Regulators. Described in this 16-page catalog section are liquid-expansion type regulators. These regulators are self-contained, entirely automatic, and require no outside source of power. *Bulletin 600 CEN.* SARCO CO., INC., 475 Fifth Ave., New York, N. Y.

Vulgum resins as crude, reclaim, synthetic rubber extenders.

INVESTIGATE *Resin and Lacquer Emulsions* as LATEX SUBSTITUTES

—Extenders and Modifiers

Resin and Lacquer Emulsions have been finding an ever-widening use in many industries. They have proved invaluable in replacing other materials in adhesives, modifiers, binders and fillers, grease proofing, waterproofing, sizing, impregnating, coating, color dispersions and innumerable other uses.

In the Rubber Industry these emulsions are being used today as *Latex Modifiers* and *Complete Latex Replacements* to extend, thicken, stabilize, increase penetration, improve resistance to acids, oils and solvents; *in Coatings* to produce adherent pigmented or clear coatings on paper, fabric and rubber and as intermediate coats for lacquer on rubberized cloth; in *Rubberizing* textiles; in *Latex Treated Papers* to increase strength and improve ageing; in *Adhesives*, for paper, for leather to cloth, and cloth to cloth.

These are just a few of the known applications in the rubber field. Undoubtedly in your own plant you will find many uses for these emulsions to improve your products and extend the supply of the vital materials, LATEX and RECLAIMS.

Our Technical Staff will be glad to make recommendations to meet your specific problems. Write today for additional information.

AMERICAN RESINOUS CHEMICALS CORPORATION

Coatings • Pigment Dispersions • Resin, Wax, Lacquer Emulsions

MAIN OFFICE and LABORATORIES, PEABODY, MASS.

Factory Branches: Newark, N. J. and Chicago, Ill.

A Few of Our Products of Interest to the Rubber Industry

ALKYD 17-B A permanently tacky, alkyd type resin emulsion containing 40% solids. When mixed in equal proportions with normal latex, the mixture for all practical adhesive purposes is indistinguishable from latex.

ALKYD 18 An alkyd type resin emulsion which is non-yellowing and non-oxidizing. Film is water-white and non-tacky. Preferred where slight oxidizing action may be considered harmful to rubber. Extender for latex in coating, combining and impregnating processes.

EMULSION 58-B A series of emulsified elastometers containing up to 65% solids. Recommended for use as full latex replacements in impregnation and combining.

PIGMENT BASES Concentrated aqueous dispersions of pigments in resin bases, available in all shades and viscosities, suitable for spreading, spraying, etc.

Also Acrylic, Vinyl, Maleic, Phenolic, Hydrocarbon, Ethyl Cellulose, Cellulose Acetate and Nitrate emulsions and solutions for various applications.

Experimental Rotary Dryer

THE C. O. Bartlett & Snow Co., Cleveland, Ohio, has introduced a small rotary dryer which is being used for experimental and research work in laboratories, and for student instruction in technical schools and colleges.

This unit has a cylinder 6 inches in diameter by 36 inches long, fitted with internal feed and lifting flights, is carried on a pair of steel riding rings, supported on trunnion rolls, and rotated with a girt gear and sprocket drive. Different size driving sprockets permit four variations of rotating speeds from 2.06 to 4.92 r. p. m. The cylinder ends have machined seal rings, which engage split breechings. The feed breeching is equipped with a feed chute. The discharge breeching has a hoppered bottom and discharge chute arranged to connect to a covered receptacle.

Stabilog Controller

THE new Model 30 Stabilog controller, introduced by Foxboro Co., Foxboro, Mass., incorporates refinements for better appearance and closer control but does not depart from proved Stabilog control principles. When panel-mounted, the instrument extends only 3/4 inch from the panel surface. A dual pressure indicator, replacing the customary two small gages, is easily seen through a rectangular opening in the recessed door. Interior illumination can be readily provided.

All operating adjustments are made from the front of the case, but the entire operating mechanism is protected and concealed behind a removable plate. Unit construction simplifies replacement of the measuring system, changing the type of control, or any other major servicing. The instrument has three functions. The first is its proportional function, providing uniform pneumatic proportional action, adjusted to the smallest value that will result in stabilization following a disturbance of process conditions. The reset function acts simultaneously with the proportional function, establishing stabilization at the desired point of control. The third function provides a temporary additional correction, determined by the rate of change in any disturbance of conditions. If the rate of change is fast, the additional correction is large; if the rate of change is slow, the additional correction is negligible. The operation of this third function is entirely automatic, being governed by the proportional and reset adjustments.

Corrosion-Inhibiting Additive for Lacquers

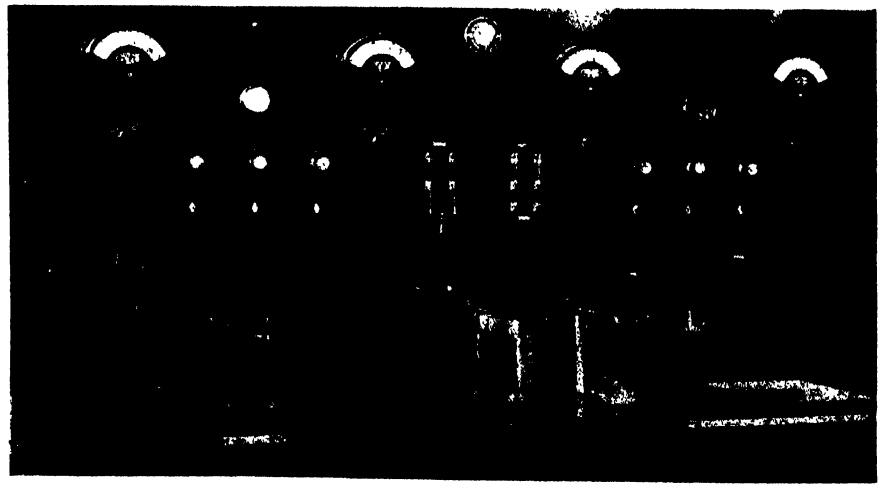
A CORROSION-INHIBITING additive for clear lacquers, nitrocellulose solutions, and alcoholic shellacs, which eliminates the need for shipping these materials in tin-lined drums, has been announced by the Merrimac Division of Monsanto Chemical Co., Everett, Mass.

The additive is a solution of an organophosphorus compound and is known as D. P. Solution. Used in lacquers in proportions of 0.1 to 1.0 per cent, it has been found to give effective protection against corrosion of iron or steel under conditions met in the handling of lacquer shipments.

Its action is ascribed to the fact that it reacts with iron to form an insoluble film.

In addition to inhibiting corrosion, the solution has demonstrated interesting properties as a flocculating agent for maintaining good suspensions of the flatting agent in flat lacquers.

Thin Slot Insulation



NEW thin types of Irv-o-slot insulations have been developed by the Irvington Varnish & Insulator Co., Irvington, N. J., to provide nonbulking slot insulation for use in confined or limited space.

Plating Laboratories Expanded

TO PROVIDE facilities for the greatly increased volume of research and experimental work, the plating laboratories of the Hanson–Van Winkle–Munning Co., Matawan, N. J., have been reconditioned and expanded. All laboratory rooms are now accessible from a central hallway. Three new offices have been constructed, as well as a library.

A new solution preparation room has been provided. Between it and the analytical laboratory, an experimental electroplating room has been built and a modern and complete electroplating control board installed. This board is used for making bent cathode tests on plating solutions, for experimental electroplating tests, and for the examination of raw materials and supplies used in electroplating processes. The board has six places for work with coded plugs and jacks to facilitate rapid setting up and tearing down of experimental plating units. It is divided into two parts, each served by one ammeter and one voltmeter, with selector switches. A field rheostat is available for control of the voltage at the generator. In addition, carbon pile rheostats have been placed in series with each set of outlets for close control of the current.

Special glass, laboratory-size, plating bath containers are provided of shape and proportions to simulate commercial conditions. A built-in timing device is included for timed experiments. The thermostatic bath is electrically heated and agitated. Compressed air is available at the panel, fitted with air filter and air regulator. Where mechanical agitation is required, air and electric motors with proper speed control are used. Research facilities have been expanded by providing more space and installing new equipment. The instrument room is used for both research and routine control. The installation includes an optical bench, special photographic equipment, and a stereoscope for microscopic examinations. A dark room is available for processing plates and films. Adjoining the instrument room, a research laboratory has been provided for the study of alkalies, inhibitors, fluxes, and related products. A large room for semicommercial plating tests has been provided on the second floor. New pumps, tanks, heating devices, and controls have been installed.

Electroplating control board

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

CHEMICAL ENGINEER, American citizen, wanted for sales training in highly specialized technical field. Location, New York City. State age, draft status, education, experience and salary record. Enclose photo. Replies considered confidential.
Box 30-T-4, Ind. & Eng. Chem., Easton, Pa.

Chemical Engineer
Physical Chemist
Cereal Chemist
Biochemist
Organic Chemist
Food Technologist
Analytical Chemist

Consideration will be given to applications from Bachelors, Masters, Ph.D.s and those with a few years post-doctorate experience. These openings represent opportunities for qualified persons in the Research Laboratories of a food organization located in the East. Applicants should submit educational history, college record, experience, age, and other personal data, with recent photograph.

Box 110-TP-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer having knowledge of and preferably experience in the production of synthetic rubber, particularly in the use of alcohol and waste agricultural materials therefore. Give complete information on education, experience and personal qualifications.
Box 16-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer; preferably recent graduate with some experience in vegetable oil and soap analytical work wanted as assistant to Superintendent of an edible oil and soap factory in Honduras. Good climate and living accommodations. Single man preferred but no objection to married man. Applicant should have some knowledge of Spanish. Send recent snapshot, personal information and salary required.
Box 20-NP-5 Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS available for next year. Salary $540 for nine months' service. Part time laboratory teaching. Write for application blanks. H. D. Newton, Head, Department of Chemistry, University of Connecticut, Storrs, Connecticut.

CHEMIST WANTED: Recent graduate or graduate with a few years of experience, development work. Draft deferred. Chicago area.
Box 32-NP-5, Ind. & Eng. Chem., Easton, Pa.

TWO RECENT graduate chemists for analytical analysis in control laboratory of large Philadelphia chemical plant. Salary $2,150, per year.
Box 59-NP-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Man or woman, widely experienced. Background in analyses of raw materials and intermediates. Large concern. Northern New Jersey. State full qualifications and salary expected. Include recent photograph. Our employees are aware of this advertisement.
Box 63-N-5, Ind. & Eng. Chem., Easton, Pa.

LARGE NEW YORK engineering firm requires chemical engineers age preferably 25-30 with any following experience: 1. Petroleum refinery experience in operation or design of stabilizers, absorbers and light end equipment. 2. Refinery experience in design or operation of plants for solvent dewaxing and solvent extraction of lube oils. 3. Refinery experience in design or operation thermal or catalytic cracking plants. In reply state education, qualifications and refinery experience in detail. Also salary expected and status regarding military service.
Box 80-NP-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. Summer teaching, eastern college. Man or woman regularly employed in college teaching in winter term preferred. Term, June 15-September 3.
Box 10-TP-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST for LABORATORY research. Rubber adhesive experience essential. State qualifications, other pertinent data, fully.
Box 14-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERS. Old established company requires men familiar with personnel and requirements of Industrial and Scientific Laboratories, as exclusive district representatives. Several key industrial areas open. Unusual opportunity. Diversified lines insure stable future. Full particulars required and will be kept confidential. Our men know of this ad.
Box 15-T-5, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST. Middle Atlantic college needs teacher for twelve week summer session, beginning June 12. Experienced teachers, preferably now employed in college teaching, desired.
Box 16-TP-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: COMPETENT chemist, Ph.D. or D.Sc. Must be graduate of acknowledged school. Must possess sound scientific background, some industrial experience desirable. Wanted for research work with nationally known manufacturer of photographic material. Photographic hobbyist preferred. Adequate compensation and excellent future opportunities assured.
Box 33-TP-5, Ind. & Eng. Chem., Easton, Pa.

Chemist Wanted

Preferably experienced in shoe cements, finishes, etc. Write stating age, experience, technical education, salary wanted.

Box 14-NP-5 Ind. & Eng. Chem.
Easton, Pa.

DESIGNERS and DRAFTSMEN

For vital war plant work carrying high priority ratings of A-1-A to A-1-C.

Working 50 hours per week with remuneration on basis of a 40-hour week with time and one-half for work in excess of 40 hours per week. Program covers 1½ years.

Must have experience in design of:

Oil Refinery Process Piping
Concrete and Structural Steel
Heat Exchangers, Pressure Vessels
Electrical Control, Light and Power
Conduit Systems

Instrument Engineers able to select and specify proper control instruments for oil refinery units.

Application should be made by letter giving age, nationality, concise outline of previous experience and educational background, present salary, salary desired and references. Include recent photograph.

BLAW-KNOX COMPANY
Process Industries Dept.
P. O. Box 5087
East Liberty Station, Pittsburgh, Pa.

WHOLESALE DRUG house in deep south has an opening for a chemist. Experienced in Analytical Laboratory and capable of manufacturing test solutions and microscopic stains. P. O. Box 1680, New Orleans, Louisiana.

ENGINEER, familiar with design of process equipment such as tube mills, ball mills, dryers, mixers, etc. State experience, details of education, salary desired and when available. Middle Atlantic District.
Box 44-TP-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: INSTRUCTOR in inorganic and Analytical chemistry, instructor in organic chemistry, assistant professor in organic chemistry. Ph.D. required. Write Department of Chemistry, University of Pittsburgh, for application blank.

BIOCHEMIST for the duration, draft exempt and experienced in the production of bacteria for commercial use. Must have at least B.S. in chemistry and the equivalent of a major in biology including bacteriology.
Box 49-T-5, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, experienced in compounding rubber, wanted for research on sealing materials used for hermetic closures. Good opportunity for young, aggressive, well qualified chemist. Middlewestern location. In reply give full particulars of training and experience, draft status, and salary desired.
Box 50-T-5, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 714)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

PHYSICAL CHEMIST and petroleum chemist wanted by long established petroleum processing concern in Los Angeles area. Some post-graduate work, or experience in fields allied to petroleum desirable but not essential. Give details including draft status and photo. All replies confidential. Our employees have been notified of this advertisement.
Box 51-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer age 27-30 experienced in development and field application of cutting oils, and compounds also wax products by large oil company; location Milwaukee, Wisconsin. Permanent position. Give complete details, education, experience, salary expected, and photograph.
Box 52-T-5, Ind. & Eng. Chem., Easton, Pa.

Specialized chemist, very well connected with industrial dyers, tanning. Would like to **represent in Argentina** a North American producer of chemical products, auxiliaries and pigments applying to these industries.

Eventually would import direct.
First class references

Apply by letter to A.B., Av. R.S. Peña 616, Buenos Aires, Argentina

CHEMIST—EXPERIENCE in manufacture of colors helpful, but not essential. A background of research and plant control advantageous. Excellent opportunity for person qualified to hold executive position. In reply, please state education, previous experience, age, and other personal data. Replies will be treated in strictest confidence.
Box 65-T 5, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, young, M.S. preferred, with basic training in analytical and biochemistry; $1500, research position in New York City. Submit details on courses, practical experience, references, personal data, photograph.
Box 68-T-5, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST—Ph.D. degree with good background in organic chemistry to conduct and organize literature researches in an Industrial Research Laboratory in New York area. Include full particulars and recent picture in first letter.
Box 73-TP-5, Ind. & Eng. Chem., Easton, Pa.

PACIFIC COAST college has an instructorship or assistant professorship for a man with physical and analytical training. Ph.D. preferred. Genuine interest in teaching, and in the aims of Christian education in a liberal arts college demanded. Give full details of training and experience, and state minimum acceptable salary.
Box 80-T-5, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

DEVELOPMENT and RESEARCH chemist with exceptional training and experience. Ability to initiate and direct research problems with sound judgment and resourcefulness. 17 years' highly successful record in heavy chemicals, petroleum, high pressure gases and catalytic processes. Desire responsible position here or in Latin America.
Box 50-T-3, Ind & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT Chemist. B.S. in Chem. Fourteen years' diversified experience on plastics, synthetic resins, organic chemicals, paints, varnishes, cloth and paper coatings and process development. Excellent record and experience. East preferred. Available immediately. Draft deferred.
Box 18-T-4, Ind. & Eng. Chem., Easton, Pa.

TEACHER RESEARCH worker; Ph.D. Majors: Physical chemistry, chemical engineering. Twelve years' teaching these with inorganic, analytical chemistry, etc. Sixteen years' industrial research, consulting, testing. Numerous publications. Employed. Seeking broader field.
Box 22-T-4, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT or ASSOCIATE professorship of organic chemistry in well established institution, beginning in September. Ph.D. prominent University, 1931. Eight years' department head in small mid-western University. Excellent record building up Department. Experience teaching undergraduate and graduate courses, directing M.S. researches, administration, placement, purchasing, glass blowing. Recent and projected publications based on M.S. theses. Sigma Xi, Phi Lambda Upsilon. Active A.C.S. section. Superior references. Protestant, age 37, married. Location immaterial
Box 37-T-4, Ind. & Eng. Chem., Easton, Pa.

METALLURGICAL CHEMIST, M.S., June 1942. Inorganic major and physical metallurgy minor. Undergraduate research in organic; graduate research in inorganic. Summer experience in analytical chemistry. Experience with metallographic photomicroscope and X-ray diffraction equipment. Defense course in metal's inspection. Desires Southern California position.
Box 40-T-4, Ind. & Eng. Chem., Easton, Pa.

CHEMIST M.S. Accredited eastern university. Fellowship. Organic major, but thoroughly trained in physical, inorganic, analysis. Desires research or production position, preferably in east. Available middle of May, 1942. Single.
Box 56-T-4, Ind. & Eng. Chem., Easton, Pa

RESEARCH PHARMACEUTICAL organic chemist, Ph.D., 1941, large mid-western university. Research experience in organic syntheses, sulfur and nitrogen compounds, vitamins. Publication. Member Sigma Xi, Phi Lambda Upsilon, Rho Chi, age 27, married, draft 2-A Now employed, but desires new connection where his abilities can be utilized fully. Available upon short notice.
Box 96-T-4, Ind. & Eng. Chem., Easton, Pa

ORGANIC CHEMIST, Ph.D. 1939 with minors in biochemistry and physical, now teaching in a western university desires full time research position. East preferred. Married, age 32. Available June 1942.
Box 11-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: 18 years' practical experience. Desire responsible position. Prefer research or head of analytical group. Will complete work for Ph.D. 1942. Major inorganic analytical. Thorough training in organic and physical. Publications. Location immaterial but prefer East. Available June.
Box 29-N-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. course work and research completed. Physical chemistry minor. Publications. Four years' teaching general and organic. Eastern location preferred but not essential. Draft deferred. Available in June.
Box 35-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. in chemistry with minor in engineering. Brooklyn Polytechnic graduate with one year industrial experience seeks job in defense plant or laboratory. Organic position preferred. Now employed but available after May. Eastern location preferred. Phi Lambda Upsilon.
Box 40-N-5, Ind & Eng Chem., Easton, Pa.

FOOD TECHNOLOGIST, married, 42, dependents. Seventeen years' experience canning, freezing, waste disposal, production management and research. Graduate chemical engineer.
Box 41-N-5, Ind. & Eng. Chem., Easton, Pa.

SUMMER EMPLOYMENT wanted Now instructor on permanent basis in General Chemistry at state university. Ph.D. 1938. Major, Biochemistry; Minor, Organic Chemistry. Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi. Research experience. Draft classification 2B. Single, Age 28. Location immaterial. Available June 8.
Box 53-N-5, Ind. & Eng. Chem., Easton, Pa

CHEMIST, B.S. in Chemistry, June, 1942. Will have also completed some graduate work at this date. Excellent basic training in organic, analytical and rubber chemistry, math. and physics. Prefer position as organic research assistant or work connected with rubber compounding. Available by mid-June. Location immaterial.
Box 61-N-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: M.I.T. graduate with twenty years' diversified experience directing (often as consultant) research and development on products, processes and equipment; developing design and initial operation of million dollar plants; solving unusual production problems; increasing morale and efficiency of men. Recently in pulp and paper; earlier in rubber chemicals, coal gasification, coatings.
Box 82-N-5, Ind. & Eng. Chem., Easton, Pa.

ELECTRO-CHEMIST, M.S. with further graduate work equivalent to Ph.D. (Electrochemistry major). B.S. in Chem. Eng. Six years' successful research and development work in electroplating and metal finishing, including bright nickel, high speed tin, copper and nickel, noble metals, alloy plating including brass and silver alloys, etc. Plant experience. Proven ability. Possesses initiative and ability to work with people. Publications and patent. Age 32, employed, 3A.
Box 86-N 5, Ind. & Eng. Chem., Easton, Pa.

AGRICULTURAL and BIOLOGICAL Chemist, B.S. 1938, Pennsylvania State College. Research in Agr. Exp. Sta. Industrial experience in food and dairy chemistry and bacteriology. Draft deferred, age 24, married.
Box 87-N 5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 8 years' design and development experience in petroleum refining, solvents, and organic syntheses. Diversified experience in all unit processes and operations. Doctor's degree in chemical engineering, M.I.T. graduate. Age 31, single, Protestant. Now employed in essential industry in minor job; desire more responsibility and permanent position with major essential chemical industry. Will work anywhere.
Box 11-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Well balanced, experienced development, research, administration and production supervision. Present position assistant to plant superintendent and in charge of development and research. Wide knowledge purchasing and sources of supply paint, varnish and printing ink industries. Diversified experience includes inventory control, production planning and scheduling, technical service and consultation ink, textile and paper problems. Broad knowledge machinery and plant operating techniques. Designed several unusual types of apparatus for testing laboratory. Prefer production supervision, technical service work or administration to strictly laboratory research. Desire opportunity for advancement with company offering reasonably permanent connection. Special interests: technical writing; photography. Single. Aged 31. Draft 3. Protestant. Available reasonable notice.
Box 12-T-5, Ind. & Eng. Chem., Easton, Pa.

ECONOMIC CHEMIST, M.S., 1940, Gamma Sigma Epsilon. Single. One year teaching. One year industrial experience. Employed. Interested in teaching general, physical, and economic chemistry; economic chemical research; sales. Business ability. Publications.
Box 13-T-5, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST M.S. 12 years' experience Agricultural Experiment Station work. Publications. Research in chemistry of foods, plants and animals. Training in physics, bacteriology, sology and mathematics through calculus. Teaching experience. Member of Sigma Xi. Age 45, married. Desire change.
Box 20-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. Univ. of Mich. '32. Married, Protestant. Ten years' experience research, development, design, operation various chemicals. Special design of equipment processes, synthetics. Continuously employed, desires position of greater usefulness and responsibility in major defense industry. Possesses initiative and capability for hard work. New York area preferred but not essential.
Box 21-T-5, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. 1935. Six years' industrial experience in enzyme production and application. Academic experience in fermentation and organic research. Married. Publications. Sigma Xi.
Box 22-T 5, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., 1941, leading midwestern university, mathematical physics minor. Now employed but seeking more interesting work, academic or industrial. Experience in electrical measurements. Single, age 26, draft 3A, good health. Phi Beta Kappa, Sigma Xi.
Box 23-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D. 1941. Outstanding Middle Western university. Now employed but desires responsible research and development position with progressive company. Experience, petroleum, metallurgical, teaching. Publication, patent. Single, 25, draft deferred. Available on reasonable notice.
Box 24-T-5, Ind. & Eng. Chem., Easton, Pa.

WANTED: OPPORTUNITY to enter and make specialty of field of organic synthesis. A.B., M.A., degrees. Experience limited to over one year analytical. Now employed. Draft exempt. Will go anywhere, but prefer N. Y. C. or vicinity.
Box 25-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST PHARMACEUTICAL Organic, training in Pathology and Physiology. Graduate work 4 years, Research assistant 3 years, now operating own successful organic synthetic lab. 2 yrs. Wide experience in analysis, research, production, and sales. Honor societies, publications.
Box 26-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER and research chemist: Ph.D. physical chemist. 12 years' industrial experience, research, development, pilot plant; pharmaceuticals, cotton finishing, cellulose research, spectrophotometry. Academic experience also. New England and New York area preferred.
Box 27-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.S. Fifteen years' varied experience in research, manufacturing, and sales service. Seeks position in oils, paints, resins, pigments, fillers, or related field.
Box 28-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL and INDUSTRIAL engineer with unusual training and affility. B Ch.E., M.A. (Ind.E.) leading universities. Candidate for M.Ch.E. (evening college). Successful experience in research and development on cellulose, lignin, extraction, engineering economics, waste utilization; prefers production. N. Y. area preferable. Single, 24, immediately available.
Box 29-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.Ch.E. cum laude, M.S., work toward Ph.D., honor societies. Excellent organic training—synthetic, micro-analytic. Food Analysis, vitamins. Studies, plastics, synthetic rubber. Executive, teaching, experiences. Resourceful, co-operative. Age 35, married, draft 4-C. Desires teaching, research, development, production position.
Box 34-T-5, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 715)

(Situations Wanted Continued)

CHEMIST B.S. leading eastern college 1932. Nine years' experience in research and production. Rubber, synthetic rubber and lacquers. Wishes to associate himself with top notch chemist in synthetic rubber, lacquers, resins or plastics. Development or research.
Box 36-T-5, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Fourteen years' diversified experience, mostly synthesis in fields of carbohydrates, pharmaceuticals, olefins. Knowledge of biochemistry, bacteriology, languages; skilled abstractor. Reasonable salary.
Box 38-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and BIOCHEMIST, Ph.D., Major Organic. Fifteen years' of research in synthetic organic, enzymes, proteins, carbohydrates, chemistry and physiology of bacteria, mechanism of drug action, immunochemistry. Forty publications, patents. Also several years' research in Europe. Now engaged in biochemical research in a large Eastern University. Desires a change to a responsible position with a progressive group. Imaginative, resourceful. Age 45. Gentile. Please give details in first letter.
Box 41-T-5, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Synthetic Rubber. Ch.E. 1927, M.S. 1928. Age 40, Draft 3A, 15 years' varied experience in research and development, process engineering, manufacturing and plant design. Expert in latex, rubber, dispersion and emulsions. Thoroughly familiar with the chemistry of high polymeric compounds, pilot plant operations, plant design, development, installation, operation and labor supervision. Protestant of American ancestry. Excellent record and references. Desires permanent position with responsibility in the development, design, construction or operation of synthetic rubber with a commensurate starting salary and chances for advancement. Location immaterial.
Box 42-T-5, Ind. & Eng. Chem., Easton, Pa.
